"It's good enough for now," Erich said, and the couches shifted under them as the thrusters turned the ship. Slowly, the moon hove into view, and behind it, the sun. Silhouetted, Luna was a disk of black from here except for a thin limn of white along one edge and a webwork of city lights. Peaches chuckled like a brook, her eyes open now, her hands pressed to her lips. The tears welling up in her eyes glittered.

"Didn't think you'd see this again, did you Peaches?"

"It's beautiful," she said. "Everything's beautiful, and I didn't think anything ever would be again."

They were all silent for a moment, and then Erich switched the view, pulling it slowly down. Below them, Earth was a smear of white and of gray. Where the continents should have burned in the permanent fire of lights, there were only a scattering of dim, dull glowing points. The seas were hidden, and the land. A funeral shroud was over the planet, and they all knew what was happening beneath it.

"*Fuck*," Erich said, and it carried a weight of awe and despair.

"Yeah," Amos said. They were all quiet for a long moment. The birthplace of humanity, the cradle of life in the solar system, was beautiful in its death throes, but none of them had any doubt that was what they were seeing.

The comm controls interrupted them. Amos accepted the connection and a young woman in UN naval uniform appeared in a high-priority panel.

"*Zhang Guo*, this is Luna Base. We do not have an approved flight plan for you. Be advised this space is under military restriction. Identify yourselves immediately, or be fired upon."

Amos opened the channel. "Hey there, Luna Base. Name's Amos Burton. Didn't mean to step on anybody's toes. If you've got someone up there named Chrissie Avasarala, pretty sure she'll vouch for me."

Chapter Forty-six: Alex

Hey there, *Chetzemoka*. This is Alex Kamal presently of the *Razorback*. Naomi? If you're there, I'd appreciate you giving me a sign. I'd sort of like to make sure it's you before we come over. Your ship's been acting a mite odd, and we're a little on the jumpy side. And, just in case it's not Naomi Nagata? I've got fifteen missiles locked on you right now, so whoever you are, you might want to talk with me."

Alex shut off the mic, and rubbed his cheek. They were on the float now, course matched with the mysterious ship only about fifty kilometers above them on the relative z-axis. The sun, larger by far than he'd ever seen it from Mars, glowed below them, heating the little pinnace almost to the limit of its ability to shed the energy. Behind him, Bobbie was watching the same feed he was.

"That doesn't look good," she said.

"Nope."

As a boy, back on Mars, there had been a little improvised firework that his friends would sometimes make for fun. All it took was a length of light-duty pipe, a mining spike, and a single-use rocket motor. The way it worked, they'd spike one end of the pipe to a flat section of wall, fix the motor to the other end with industrial tape or epoxy with the thrust pointing off to one side. Fire the motor, and the whole thing turned into a ring of smoke and fire, the pipe spinning around its axis faster than the eye could follow, the flare of the motor exhaust blinding and flickering. Sometimes the motor came loose and bounced along the corridor, posing a threat to everyone watching. Sometimes the spike came loose. Most times, it just left a circle of scrapes and scorch marks on the stone of the wall that pissed off the maintenance crews. They called them fire weasels. He didn't know why.

Above them, the *Chetzemoka* was spinning like a fire weasel. She wasn't quite tumbling, but the circle she was burning in was tight. All the acceleration she'd been using to burn hard out toward the Belt and Holden was getting eaten now, each point on her pathway canceling out the point a hundred and eighty degrees off from it. Her exhaust plume was a jet of flame and plasma that would glass anything that tried to approach her unless it came from above or below. And if they did that...

"What do you think happened?" Bobbie asked.

"Maneuvering thruster fired off, never got balanced."

"Can you match course with that? I mean even if we decided we wanted to?"

Alex pressed the tip of his tongue to the back of his teeth and willed Naomi to call him. To give him a sign that she was still alive. That he wasn't about to risk his ship and his life and the lives of the people with him to rescue a corpse. "Might have to come up with something clever."

He pulled up the tactical display. The *Razorback* and her cloud of missiles with no one left to shoot at. The *Chetzemoka* chasing its tail like a terrier that had gulped down its own body weight in uppers. Then, far distant, the UN escort decelerating in from the sun toward a matching course, and the *Roci* doing the same from the Belt. Everything was coming together right here—the head of the OPA, the prime minister of Mars, Avasarala's best cavalry—because it was where Naomi Nagata was, and as long as Alex and Holden were drawing breath, they'd be looking out for their own.

The screen lit up with an incoming message, but not from the *Chetzemoka*. Alex accepted it, and Holden appeared on the screen. For about four seconds, the captain didn't do anything but look into the camera and scratch his nose. He looked tired and thin. Alex felt the same way himself. Then a smile bloomed on Holden's face, and he seemed more like himself again. "Alex! Good. Tell me what we're looking at."

"Well, we haven't had any new messages since their radio cut out, but if that was an intentional message, this looks like about the worst definition of 'in control' I've seen in a while. This mystery ship's not quite on the tumble, but she's damned close. The way she's chasing her tail, it's not going to be easy making an approach, but I'm working on an idea. The *Razorback* wasn't built for airlock to airlock. This here's the kind of ride

you land in a hangar. But we've got EVA suits for me and Nate. That's the prime minister. I call him Nate now. Don't be jealous. Anyway, I figure we put the *Razorback* at the center of the circle Naomi's making with our nose up and our ass down, then match roll to the circle she's making. Then as long as no one pukes in their helmet, we can send someone over to the airlock. Not sure it'll work, but it's the best idea I've got so far."

He leaned forward while the tightbeam laser flew the four light-seconds out to the *Rocinante*, then the four light-seconds back. To judge from the shape of Holden's face, he was probably at more than one g. Even if the *Chetzemoka* hadn't gone into its surprise spin, the *Razorback* would have been the first to reach it. Holden's temporary pilot was going to be buying Alex a beer, provided nothing new and unexpected blew up on them. Not that he'd have given good odds on that.

Five seconds in, he remembered that he'd wanted to mention that Bobbie had power armor. He didn't say it, though, since it would just interrupt whatever Holden was saying right then that wouldn't be back to Alex for a few more seconds. Light-delay conversations were all about etiquette and taking turns.

"Why don't we try that as proof of concept?" Holden said. "If it looks like something we can do, I can have the *Roci* take your place when we get there. Then if we need to cut in through the hull, we can. Have you had any sign from Naomi?"

"Not yet—" Alex began, but it turned out Holden hadn't been finished, just pausing for breath.

"Because that whole 'Tell James Holden I'm in control' thing was weird on a lot of levels. I checked the vocal profile of the message coming off the *Chetzemoka*—well, actually Fred did. It wouldn't have occurred to me. Anyway, the way she said James Holden in the first warning message about the bad bottle drivers and the way it was in this new one? Exactly the same. Fred thinks the new message may have been faked. Only then the way it got modified before it shut off... I'm seeing something here, Alex. But I don't know what it is."

This time Alex waited until he was sure Holden was done before he started talking. "We haven't had any sign at all, but it seems to me that someone on the ship's been trying to raise a flag. And this flying in circles bit makes it seem a lot less like a Trojan horse. Nothing to gain by doing it,

other than make everyone inside feel powerfully like throwing up. Honestly, I don't know what we're looking at here either, Cap'n, and I don't think we're going to know until we get someone inside."

Eight long seconds there and back again. "I'm just worried that if she is in there and the ship's out of control, we're going to be sitting out here dithering while she needs us. I can't stand the idea that we've come this close, and now we're going to lose her. I know it's a little crazy, but I'm a little crazy right now. I keep thinking of her being smashed up against the wall by the spin, and me out here where I can't do anything."

"Yeah, thruster misfires don't work like that," Alex said. "You don't get any sideways impulse unless the thruster's actually going. After that, you've got a little spin station action pushing the folks behind the center of spin down and the folks forward of it up, but all that is gonna be in line with the thrust from the drive, so all you actually get is—"

"Alex!" Bobbie said. "We've got something."

He twisted on his couch, then turned it to face her. Bobbie's eyes were on the wall screen. A panel was there, opened to the view from the upper camera. The *Chetzemoka* was still in its mad spin, but something had come off, floating now across the clear, empty void, stars behind it like the glittering pupil of a vast eye. The eye of the storm. Bobbie tried to zoom in on it the same moment Alex did, and the system made a confused, upset chime, the focus fluctuating wildly before coming to rest. A figure in an EVA suit. There were no lights on the suit, and its back was turned to them, the intense sunlight making the gray material shine almost too brightly to make out details.

"Is she alive?" Alex said.

"She's moving."

"How long ago did she come out?"

"Not long," Bobbie said. "Seconds."

The figure in the EVA suit lifted her arms, crossing them over her head. The Belter signal for danger. Alex felt his heart speed up.

"Alex!" Holden said, from four seconds ago. "What's going on?"

"Someone came out of the ship. Let me figure this out, and I'll be back with a report," Alex said, then cut the connection. On Bobbie's screen, the figure had shifted to a time signal. *Five minutes*.

"What have we got?" Alex said.

“She’s making the same signs,” Bobbie said. “Here we go. ‘Danger. Do not approach. Explosion hazard.’ But then here’s ‘Low air,’ and ‘five’... shit, ‘four minutes.’ ”

“Is it her?” Alex said, knowing there wasn’t an answer for that. Even if the figure turned its face to them, Alex wasn’t certain between glare and the suit’s helmet if he’d have been able to identify Naomi. It was just a person in an EVA suit, running out of air and warning them over and over again that it was a trap.

But Alex thought that whoever it was, they sure moved like Naomi. And they’d both been calling the figure “she.” They might not know, but they were both pretty certain. The body of the *Razorback* felt suddenly claustrophobic. Like the appearance of Naomi right there where he could see her required more room to move. Enough space to reach her. Alex set the pinnacle’s system to the diamond-bright suit and started it calculating.

“Where’s she going to go?” Bobbie asked.

“Looks like she’s set to drift across into the path of the ship again,” Alex said. “If it don’t hit her, maybe she gets past and the drive plume gets her.”

“Or we watch her suffocate?” Bobbie said.

“I can take the ship in,” Alex said.

“And crisp her decelerating?”

“Well... yeah.”

“Get your helmets on,” Bobbie yelled loud enough to carry into the back cabin. “I’m going in.”

“That suit’s got enough thrust to do a fifty-klick flip-and-burn in under four minutes?” Alex asked, but he was already sealing his suit as he said it.

“Nope,” Bobbie said, reaching for her helmet with one hand and a spare bottle of air with the other. “But it’s got really good mag boots and gloves.”

Alex checked his seals and got ready to open the *Razorback* to the void. “Don’t see how that’s going to help.”

The prime minister’s cabin showed it was sealed. On the monitor, the figure—Naomi—signaled *Danger. Do not approach. Explosion hazard.* Bobbie yelped, took a deep shuddering breath. Her voice was coming through the EVA suit’s radio now. “God damn, it’s been a long time since I was on the juice. This is some powerfully unpleasant shit.”

“Bobbie, we’re running out of time here. How are mag boots going to get you to Naomi?”

Behind her helmet's visor, Bobbie grinned. "How good's your control on those missiles?" she asked.

Chapter Forty-seven: Naomi

Leaving the airlock this one last time was the most peaceful thing Naomi could imagine doing. As soon as she'd cleared the outer door, the sun and stars had stopped their gut-sickening whirl. She had taken her tangent from the whirling circle of life, and now her path was a line. Well, not a tangent, really. A secant, and doomed to cross paths with the ship again, only maybe not in her lifetime.

For a moment, she let herself enjoy drifting. The sun pressed against her back, the light radiating past her as she cast a shadow on whole stars, galaxies. The sense of whirling faded a little, and she wondered where Alex was, out among all these stars. She remembered to start counting. One thousand and... how long had she already been out? Seven? Eight? Well, she might as well think the worst. One thousand and thirty. Why not? She lifted her hands over her head. *Danger*. Then *Do not approach*. Then *Explosion hazard*. She felt like she was trying to warn the stars. The Milky Way. *Don't come here*. *Stay away*. *There are humans here, and you can't trust them*.

She stretched with every motion, letting it all go. She should have been scared, but she wasn't. She was going to her death, and that sucked. She would have liked to live longer. To see Jim again. And Alex. And Amos. She would have liked to tell Jim all the things she'd been so careful for so long not to say. One thousand and sixty. Time to change her signs. Four minutes left. Four minutes and a lifetime.

Somewhere out there, Filip was with his father, the way he had been for years. Since he was a baby. And Cyn, poor Cyn, already as dead as she was going to be because he'd seen her in the airlock and thought stopping her would have been saving her. Thought the life she had with Marco was

worth having. She wondered what would have happened if she'd stayed. If the *Chetzemoka* had flown without her. Would Jim have set off the bomb? She had to think he would have. He wasn't a man who reined in his curiosity well. The stars shuddered, blurred. She was weeping. *Danger. Do not approach. Explosion hazard.*

If the suit had been powered, it would have been screaming alerts at her. She was almost glad now that it wasn't. She wasn't even light-headed yet. She'd seen people pass out. As long as her CO₂ scrubbers kept working, it would be a peaceful way to go. No choking, no panic. Just a moment's disorientation and then, softly, out. Here she was, after so many years, throwing herself out another airlock. She could still remember that first one, back on Ceres. It had been set in the floor, of course, but she could still conjure up the feeling of pressure on her fingers when she'd told it to cycle open, still believing that it meant her own death. And even then, she hadn't wanted to die. She'd just wanted it to be over. To be free of it all. For the pain and guilt to be over. And the feeling of being trapped. She might have been able to stand all the rest of it, but not the sense of being caught.

This death wasn't at all like that. This was throwing herself in front of a bullet so that it wouldn't hit her friends. Her family. The family she'd chosen. The one built from people who had risked their lives for her. She wished Cyn could have met Jim. Could have understood how far she'd come from the girl he'd known on Ceres, back in the day. How much she wasn't just Knuckles anymore.

She wasn't religious, but she'd known any number of people who were. *Explosion hazard. Low air. Three minutes.* She wondered whether they would have thought what she was doing now was sinful. Giving herself over to the void in hopes that Alex would see her, would understand, would save himself.

And her. It would be nice if somehow he found a way to save her back. Or if Jim suddenly swept down from the stars to gather her up. She chuckled. God knew he'd try. Always blundering into being the hero, her Jim. Now he'd know what it had felt like for her all those times he'd squared his jaw and run off into near-certain death because it was the right thing. Pity she wouldn't be there to point it out to him. He might not connect those dots himself. Or he might. He'd changed over the years, and

he wouldn't change back.

Danger. Do not approach. Explosive hazard. She'd lost count again. Two minutes? One? She didn't know. She found herself humming a melody she'd heard as a child. She didn't know the words to it. They might not have even been in a language she knew. It didn't matter. She was glad for the song's company. Grateful. More than that, she was grateful that she wasn't going to die nauseated. *Okay, fine. If this is what I get, this is what I get. Not a life without regrets, but none I can't live with. None I can't die with.*

Still, she thought to the universe, if it isn't a problem, I wouldn't say no to a little more.

Something moved off to her left, streaking out from behind her. Huge and metal and shining brightly in the sun. It looked like a missile, pointing back toward the sun as it retreated. Its drive wasn't firing. That seemed weird and kind of random. She wondered if—

The impact came in the center of her back, hard as an assault. An arm wrapped around her shoulder and a leg around her waist locking her immobile. She squirmed by reflex, trying to escape the attack, but whoever it was had her cold. She couldn't escape. She felt the other person's free hand fumbling at her suit. Something hard and metal pressed against her thigh where the air bottles would go.

Her ears popped as the pressure in the suit suddenly changed. A clean, vaguely astringent smell filled her nose. A fresh bottle. She almost laughed. She was being held in a rescue hold. The newcomer did something else she couldn't quite figure, and then locked a tether to her waist and released her. When they rotated together, face-to-face, the newcomer grabbed Naomi's helmet and pressed her own against it.

"Bobbie?" Naomi said.

"Hey," the Martian ex-marine shouted, grinning. The sound carried from suit to suit by the conduction, and it made her sound terribly distant for someone who was holding Naomi in her arms. "Imagine meeting you here, right?"

"I'd say it's really good to see you," Naomi shouted back, "but that seems weirdly understated. The ship! It's rigged to lose bottle containment if another ship sets off its proximity alert."

Bobbie scowled and nodded. Naomi saw the woman's mouth moving as

she relayed the information to someone. To Alex. She watched Bobbie listen to something she couldn't hear. She looked older than the last time Naomi had seen her. She looked beautiful. Bobbie said something else into her mic, then pressed their faceplates together again.

"I'm going to start moving us around," Bobbie shouted. "We need to point our feet toward the sun. Low profile. Suck up less heat, okay?"

Naomi buzzed with questions that didn't need answers. "Okay," she shouted back.

"Are you in immediate medical distress?"

"Probably. It's been a really hard day."

"That's funny," Bobbie shouted in a voice that meant it wasn't funny. "Are you in immediate medical distress?"

"No. I don't think so."

"All right. Put your arms over my shoulders and lock your forearms." Bobbie pulled back a few centimeters and demonstrated the forearm lock. Naomi made the Belter sign that meant roughly *Acknowledged and understood*. A few seconds later, Bobbie's armor fired thrusters, and Naomi's weight came back. She was being lifted up, carried into the stars. The sun-bright drive plume of the *Chetzemoka* passed them, dwarfing the small, dark box of the ship itself. It fell away toward the sun and slowly, over the course of long, eternal minutes, vanished below them.

They didn't fit in the pinnacle. Not really. It was made for one, maybe two, and it had four with one of them in powered armor. The air was hot and thick, and the recyclers were starting to throw alerts and errors. Alex had shut down the reactor and switched to batteries so they wouldn't be generating as much heat.

"I mean, we could make a burn for it," Alex said, "but we got people coming from both directions and half as many crash couches as we've got folks."

He was in the one actual couch at the front of the pinnacle. Bobbie sat curled near the mutilated deck where another couch had once been. The door to the cabin was open, and the prime minister of Mars floated there in

a sweat-stained undershirt. He made the place seem dreamlike. For herself, Naomi floated near the ceiling. Alex had set the wall screens to show the outside, but it was all so much less vivid than the real thing. It didn't fool her.

The *Chetzemoka* was below them, a spinning black dot against the overwhelming white sun. She caught glimpses of it at the edges of the floor where the screen stopped. Alex had also had the *Razorback's* system highlight the incoming UN escort ships and, in blue, the *Rocinante*.

"So," Alex said. "XO. You're... ah. Out here. That was kind of unexpected."

"Wasn't thinking to see you either, Alex," Naomi said. Her blood felt strange in her veins. Sluggish and bright at the same time. And she was having trouble focusing her eyes. Her hands had lost the worst of the swelling, though. The hours of work between the hulls had probably worked all the extra fluid back in where it belonged. Something like that. Her entire body hurt, and she was still discovering how profound her nausea had been as layers of it she hadn't recognized resolved. Her twenty-second sunburn from the jump off the *Pella* was swollen and tender to the touch, but not blistered. It would peel once it had healed enough. When she'd gotten into the *Razorback*, and the ship had been sealed, she'd drunk a liter of water from a bulb and she hadn't had to pee yet. The dehydration headache was starting to lose its hold. Bobbie had offered her painkillers, but something in Naomi resisted the idea of doing anything else to her body until she'd seen the inside of a medical bay.

She realized that her consciousness had flickered out when it came back. Bobbie and the prime minister were talking about good noodle restaurants in the major neighborhoods of Londres Nova. The air was thick and close and stank of bodies. She was sweating in her crappy EVA suit. The blue dot that was the *Rocinante* had grown a halo, the drive pointing toward them as it slowed to match their course.

In the corner of her eye a blackness flickered and was gone.

"Alex," she said, and then coughed so long and hard Bobbie had to brace her. When her lungs were clearer, she tried again. "Alex. Can you spare a couple of those missiles?"

"Depends, XO," Alex said. "What did you want me to do with them?"

"Kill that ship," Naomi said.

“It’s all right,” Alex said. “We warned everyone about how it’s booby-trapped. No one’s going to—”

“Not because of that. Just because it’s time for it to go.”

Because I tried to give it to my son instead of a childhood. Because I spent my own money to get it, and it turned into a trap for me and the people I love. Because everything about that ship was a mistake.

“Ah. Looks like it’s registered to an Edward Slight Risk Abatement Cooperative. They going to be okay with us knocking their bird into the sun?”

“It’ll be fine,” Naomi said.

The prime minister lifted his finger. “It seems to me that—”

“Missiles away,” Alex said, then smiled an apology. “You’re the head of my government, Nate, but she’s my XO.”

“Nate?” Naomi said. “You’re on a first-name basis now?”

“Don’t be jealous,” Alex said and pulled up a panel. Against the sun, the ship was nothing. A tiny darkness spinning below them like a fly. And then it was gone.

I’m sorry, Filip, she thought.

She turned her head toward the approaching *Rocinante*. It was closer.

Chapter Forty-eight: Holden

If the medical bay could have raised its eyebrows and made judgmental little tsk-tsk sounds, it would have. Instead, the readout threw a list of amber-colored alerts so long that the first few scrolled off the screen before Holden could read them. Naomi grunted when the needle poked into her vein and the medical expert system's custom cocktail started flowing into her. Holden sat beside her, holding her other hand.

The transfer from the *Razorback* had been easy enough. Once they'd matched course, Alex snugged the pinnace up against the airlock, and all four of them had come over together. Holden had been waiting on the other side of the lock, not quite willing to believe that they were really back. Fred Johnson was there too in his greeting-a-political-grandee outfit. It was strange to see Fred visibly change roles, holding his body differently, his expression changing so subtly and profoundly it seemed like the shape of his skull had shifted. It left Holden a little curious about how much the old man presented to him was also tailored to the situation. Chances were, he'd never know.

When the inner door cycled open, he'd forgotten about Fred and the prime minister of Mars and the destruction of Earth and pretty much everything that wasn't Naomi. Her skin was ashen where it didn't look slick and swollen from radiation burns. Her eyes were bloodshot and bleary with a profound exhaustion. Moving into the room, she was careful, like any unexpected bump would hurt. She was the most beautiful thing he'd seen in years. He felt like he was the one returning home now that she was here. When she saw him, she smiled, and he grinned back. Somewhere a few feet away or a few miles, Fred Johnson and Nathan Smith were making some kind of formal greeting. It didn't matter at all.

“Hey,” he’d said.

“Hey. You take care of the place while I was out?”

“Had some trouble with the contractor, but I think we got it straightened out,” Holden said. Then Bobbie had put a wide, strong hand on his shoulder, shaken him slightly, and said, “Med bay.” And then Naomi headed for the lift, leaning against Alex for support. She looked wounded, exhausted, halfway to dead. But she’d seen him, and she’d smiled, and it had dropped the bottom out of his heart.

The alert sounded, counted down, and gravity came back. Naomi coughed. It was a wet, painful sound, but the medical bay didn’t seem concerned. The machine had a shitty bedside manner.

“Do you think we should get a medic?” Holden said. “Maybe we should get a medic.”

“Right now?” Naomi asked.

“Or later. For your birthday. Whenever.” The words tumbled out of his mouth without stopping by his brain once, and he didn’t care enough to rein them in. Naomi was back. She was here. A vast fear he’d been carefully not noticing washed over him and started to dissipate.

This was how she felt, he thought. With the *Agatha King* and when he’d headed off to the station in the slow zone. When he’d gone down to the surface of Ilus. All the times he’d thought he was protecting her from his risks, this was what he’d been doing to her. “Wow,” he said. “I’m kind of an asshole.”

She opened her eyes in two bright slits and made a small smile. “Did I miss something?”

“Sort of. I just went someplace for a minute, and I’m back now. And so are you, which is really, really good.”

“Nice to be home.”

“But while you were... I mean while we were... Look, when I was back on Tycho, I was talking with Monica. And Fred. I mean I was talking to Fred about you and us and what I was entitled to know and why I thought all that. And Monica was talking about why I lied and whether what she did had any power and how it was ethical and responsible to use it. And I was thinking—”

Naomi raised her hand, palm out. Her forehead creased. “If you’re about to tell me you had an affair with Monica Stuart, this may not be the best

time.”

“What? No. Of course not.”

“Good.”

“It’s just I’ve been thinking. About a lot of different things, really. And I wanted you to know that whatever you were doing and going through that you didn’t want me to be a part of? You don’t have to tell me if you don’t want to. I’m really curious, and I want to know. But whatever it was, it’s only my business if you want it to be my business.”

“All right,” she said, and closed her eyes again.

Holden stroked her hand. The knuckles were raw, and there was a bruise on her wrist.

“So when you say ‘all right’—”

“I mean I missed you too, and I’m glad I’m back, and could you go get me a bulb of green tea or something?”

“Yes,” Holden said. “Yes, I can.”

“Don’t hurry,” she said. “I may just take a little nap.”

Holden paused at the hatch, looking back. Naomi was watching him go. Her eyes were tired, her body stilled by exhaustion, but she was smiling a little. It helped to see that she was glad to be back.

In the galley, a half-dozen voices were in competition, gabbling one above the other toward a kind of symphonic shared excitement. It sounded like he felt. Holden ducked in. Alex was sitting on one of the tables with his feet on the bench, talking to Chava Lombaugh and Sun-yi Steinberg, describing something about fast-cycling targeting stutter and acceleration. Chava was talking at the same time, her hands in motion, presenting some physical description of whatever they were on about. Sun-yi was just looking from one to the other, amused. At the next table over, Bobbie Draper was sitting down, but still looming over Sandra Ip and Maura Patel. Bobbie had swapped her powered armor for a slightly-too-small jumpsuit with TACHI stenciled on the back. She caught his eye, smiled, and waved. He waved back, but Sandra Ip had already recaptured her attention, and Bobbie was shaking her head and answering a question he hadn’t heard.

Holden had the sudden, visceral memory of being at home with his family, eight parents sitting down to dinner together with their one son, having half a dozen conversations with and past each other. Even though he

recognized he was already primed for it, the sense of peace and well-being that washed over him was profound. This was what family looked like, sounded like, how they acted. Even the new crew who he'd been trying not to resent felt more like distant cousins who'd come for a long visit than interlopers.

Alex hopped down and came over to him, grinning. They stood for a long, awkward moment before they gave in and embraced, clapping each other on the back and laughing.

"No more leave," Holden said.

"Holy shit. Right?" Alex said. "I take off for a few weeks, and everything turns into chaos."

"It really, really does." Holden went to the coffee maker and Alex followed at his elbow. "I think this has to qualify for the worst vacation ever."

"How's Naomi doing?"

Holden picked out the tea that Naomi liked best. The machine chimed calmly. "Getting hydrated mostly. She sent me off to get her a drink, but I think she actually wanted me to stop hovering over her, trying to start a conversation."

"She may take a little time getting back to full power."

"Intellectually, I know that," Holden said, picking up the bulb of tea. It smelled of lemongrass and mint even though there was nothing anywhere on the ship that was remotely like either one. Holden grinned. "Chemistry is amazing, you know? It's really, really amazing."

"Any word from Amos?" Alex said, and his smile dimmed at the answer in Holden's eyes. He tried to force the carefree tone back into his voice when he spoke, but Holden wasn't fooled. "Well, that doesn't mean much. It won't be the first time a planet's blown up on him."

"They're starting to get confirmed death lists," Holden said. "It's still early. A lot of things still falling apart down there, and there's going to be a lot more bad before it sees better. But he's not on the list yet."

"So that's good. And c'mon. It's Amos. Everyone on Earth dies, and he'll probably stack the bodies and climb up to Luna."

"Last man standing," Holden said, but he headed back to the medical bay with his heart a little less buoyant. Naomi was gone, the needle that had been in her arm resting on the gel of the bed and the expert system gently

prompting someone to intervene. Holden, the bulb of tea in his hand, checked the head and the galley before he thought to go back to the crew quarters.

She was on their bed, her knees curled up toward her chest, her eyes closed, her hair spilling over the gel. She snored a little, soft animal sounds of peace and contentment. Holden put the tea on the desk beside her so that it would be there waiting when she woke.

The ops deck was quiet, relatively speaking. Gor Droga, one of the weapons techs, was at a workstation, monitoring the ship and listening to something that had a beat on headphones. All Holden could hear of it was a slightly shifting bass line and an occasional phrase or two when Gor was moved to sing along. The lyrics were in something close to French without actually being French.

The lights were low, most of the illumination coming from the monitors. Holden didn't have a pair of headphones close to hand, so he just kept the volume low and watched Monica Stuart being interviewed. The man she was talking to was based on an L5 station, but the transmission gaps had all been edited out to make it seem like they were in the same room.

"No, it doesn't surprise me at all that the OPA would assist in escorting Prime Minister Smith. Fred Johnson has been vocal and active for years in bringing the OPA into the diplomatic discussion, often against resistance from the inner planets. If anything, I think there's a real irony in the fact that this series of attacks by the Free Navy have been the catalyst to cementing the OPA's legitimacy with Earth and Mars."

The camera cut to the interviewer. "So you don't see the Free Navy as a part of the OPA?"

And back to Monica. Holden chuckled. She'd changed her blouse between questions. He wondered what the lag had been like before it got edited down for the feed. "Not at all. The Free Navy is interesting in part because it gives the radical fringe of the OPA a different banner to raise. It represents a sort of self-selected culling of the elements that have kept the Belt from being better respected by the inner planets. And keep in mind,

Mars and Earth weren't the only targets of the Free Navy's coup. Tycho Station is as big a success story as Ceres for Belters, and it was attacked too."

"Other pundits are calling that a changing of the guard within the OPA, though. Why do you see it as something external?"

Monica nodded sagely. It was a well-practiced motion, and it worked to make her seem intelligent and thoughtful but still approachable. There was an artistry in what she did.

"Well, Michael, sometimes when we make these distinctions, we're really creating them more than describing anything that's already there. We're seeing a very broad realignment on more than one side. It seems clear that elements in the Martian military have been involved with supplying the Free Navy, and also that Prime Minister Smith was their target. So would we call that a rogue element on Mars, or an internal power struggle? In fact, I think the best description we can probably make at this point isn't in terms of UN and Martian Republic and OPA, but the traditional system being brought together in the face of this new threat. This situation grows out of a deep history of conflict, but there are new lines being drawn here."

Fred chuckled. Holden hadn't heard him come up, but there he was, looking over Holden's shoulder. Holden paused the feed as Fred took a couch across from him.

"You can always tell your media relations team is doing their job when the journalists are down to interviewing each other," Fred said.

"I think she's doing good work," Holden said. "She's at least trying to put this all in a context where it makes sense."

"She's also rebranding herself as an expert on me personally. And you, for that matter."

"Okay, that is a little weird. Any other news I should know about?"

Fred glanced over at Gor, scowled, then leaned over and tapped the man's shoulder. Gor took off the headphones.

"Take a break," Fred said. "We'll make sure she's solid."

"Yes, sir," Gor said. "Be aware that this close to the corona, we're building up a little heat."

"We'll keep an eye on it."

Gor unstrapped and slid down the ladder. Fred watched him go with a

wistful smile. "I remember when I could take a ladder that way. Been a few years, though."

"I don't anymore either."

"Thus does age make cowards of us all. Or maybe that's conscience," Fred said, and heaved a sigh. "Inaros and his ships haven't made it as far as Saturn's orbit yet, and piracy in the outer planets is spiking. The colony ships are well supplied, under-armed, and there are a lot of them."

"They weren't expecting a civil war."

"Is that what this is?"

"Isn't it?"

"Well. Maybe. I've been talking to Smith. I don't suppose Alex and Bobbie overheard much of what he was doing on the *Razorback*?"

Holden leaned forward. "I don't think they were spying on him, no. Were you thinking they would?"

"I was hoping your man might have. This Draper woman's too much the patriot. So, without outside confirmation, Smith's story is that there's a breakdown in the naval command. Might just be that someone's been selling a great chunk of their ordnance to Inaros. Might be there was another actor who was willing to swap out."

"For the protomolecule," Holden said. "That was the price of all this, wasn't it?"

"No one knows it's missing aside from you, me, Drummer's men, and whoever took it. I'll keep it quiet as long as I can, but when we get to Luna, I think I have to tell Smith and Avasarala."

"Of course you do," Holden said. "Why wouldn't you tell them?"

Fred blinked. His laugh, when it came, was deep and rolling. It came up from his belly and filled the air. "Just when I think you've changed, you come out with something that is uniquely James Holden. I don't know what to think about you. I really don't."

"Thanks?"

"Welcome," Fred said. And a moment later, "There are ships burning for the gates. Martian military ships. It would help me a great deal to know if they answered to Inaros or to someone else."

"Like the one who got the protomolecule sample?"

"Anyone, really. I want to talk to Nagata."

The atmosphere between them went cool. "You want to interrogate her."

“I do.”

“And you’re asking my permission?”

“It seemed polite.”

“I’ll talk to her about it when she’s recovered a little more,” Holden said.

“Couldn’t ask for anything more,” Fred said, heaving himself to his feet. At the edge of the ladder, he paused. Holden watched him consider sliding down the sides the way Gor had. He watched Fred decide not to. Rung by rung, Fred climbed down out of the ops deck, shutting the hatch behind him. Holden turned the feed back on, and then off again. His head felt filled with cotton.

He’d been so focused for so long on distracting himself from Naomi’s absence, now she was back, he felt almost overwhelmed. Monica was right. Things had changed, and he didn’t know anymore what his place was in them. Even if he turned away from Fred and Avasarala and the politics of his own minor celebrity, what could an independent ship do in this new, remade solar system? Were there banks that would be able to pay him if he took a job flying cargo to the Jovian moons? And the colonists that had already gone through the rings to new, alien worlds? Would the Free Navy really stop resupply from getting out to them, and the raw materials and discoveries they made from getting back?

More than anything, the attacks seemed inevitable and petty. If the inner planets hadn’t spent generations showing the Belters that they were disposable, there might have been some way... some way to adapt their skills and lifestyles into this larger human expansion. A way to draw all humanity forward, and not just part of it.

And how long would Inaros and people like him really be able to keep the flood of colonists out? Or maybe there was still something more, some layer of the plan that they hadn’t seen yet? The idea filled him with something he decided to call dread because that was a better name than fear.

The monitor chimed. Alex, requesting a connection. Holden accepted it gratefully.

“Hey there, Cap’n,” Alex said through a grin. “How’re you doing?”

“Fine, I think. Just killing some time away from the cabin so I don’t wake Naomi up. I figure she’ll be asleep for twelve, fourteen hours.”

“You’re a good man,” Alex said.

“You?”

“I’ve been showin’ your temporary pilot all the ways he could have beaten me to the *Chetzemoka* if he’d thought of them.”

“Be nice,” Holden said, but he didn’t really mean it. “Where are you? I’ll come join you.”

“Engineering,” Alex said. “Which was part of why I wanted to talk to you. I just got some good news from Luna.”

Chapter Forty-nine: Amos

Loading mechs moved pallets of gray or white plastic crates along the length of the Aldrin docks and drowned out the jabber of human voices with the clanks and whirring of machines. Stokes and the other refugees from Rattlesnake Island were in a huddle along one gray wall, trying to only block the cart traffic a little bit while a civil servant with an oversized terminal processed them one at a time. The security force in black armor stood arrayed before the lock to the *Zhang Guo*, scowling. The wall screen was set to look outside at that truck-tire gray moonscape.

Chrisjen Avasarala's red sari stood out, a vibrant spot of color, and her voice cut through the clamor like it wasn't there.

"What the fuck do you mean we can't go on the ship?" she said.

"No warrant," Amos said. "Nobody's getting on my boat here without a warrant."

Avasarala tilted her head, then looked at the woman in charge of the security squad.

"Seeing that you and he seemed to have an understanding, ma'am," the security chief said, "I didn't want to press the point."

Avasarala waved her hand impatiently like she was fanning away smoke. "Burton, for one thing, that's not your fucking ship."

"Sure it is," Amos said. "Salvage."

"No. When you break into someone's private hangar and drive out in their ship, it's not salvage. That's still theft."

"You sure about that? Because it was looking awfully busted up down there. I'm pretty sure that was salvage."

"For another thing, we're under martial law, so I can do very nearly whatever the fuck I want. Including march through your precious little ship

there towing you along behind in a ball gag and lacy underwear. So your warrant bullshit? You can roll that up and fuck it. Now tell me why I'm here."

"You know just 'cause you can do something, it doesn't mean you should. I don't look great in frills."

She crossed her arms. "Why am I here, Amos?"

Amos scratched his cheek and looked back at the *Zhang Guo*. Stokes and the servants were all out, but Erich and Peaches and the crew from Baltimore were all still inside. Some of them, including Erich, were either living under fake identities or weren't in the system at all.

"Here's the thing," Amos said. "If you did go in there, you might feel like you had to do something. And then I might feel like I had to do something. And then we'd all be doing things, and we'd all wind up having a worse day, just in general."

Avasarala's face went calm, her eyes focused a few centimeters to Amos' left. The security chief started to say something, but Avasarala put out a palm to stop her. After a few seconds, Avasarala grunted, shook her head, and turned to the security force. "You can skip this one. Go get a beer instead or something. It's all right."

"Yes, ma'am," the security chief said.

"Burton? You make goddamned sure there isn't any trouble from this, and you get her the fuck off my moon without anyone seeing her."

"You got it, Chrissie."

"Don't fucking call me that. I'm the acting secretary-general of the United Nations, not your favorite stripper."

Amos spread his hands. "Could be room for both."

Avasarala's laughter rang out through the dock. The security force broke up, moved on. The loading mechs repositioned. The carts continued on their various paths, busy as a kicked anthill. "I'm glad you made it," she said when she regained herself. "The universe would be less interesting without you."

"Likewise. How's the recovery going?"

"It sucks donkey balls," she said, shaking her head. "We're still losing thousands of people every day. Maybe tens of thousands. The food's running out down there, and even if I had enough rice to feed them all, the infrastructure's so fucked there's no good way to distribute it. Not to

mention that there could still be more of those fucking rocks dropping anytime.”

“Your kid okay?”

“Ashanti and her family are fine. They’re here on Luna already. Thank you for asking.”

“And your guy? Arjun?”

Avasarala smiled, and it didn’t reach her eyes. “I remain optimistic,” she said. “The *Rocinante* is on its way. You’ll have something to ride on that doesn’t make your cock look as small as that gaudy turd.”

“That’s good to hear. This boat’s not my style anyway.”

Avasarala turned away, shuffling awkwardly into the crowd. The low gravity didn’t seem natural to her. He figured she probably hadn’t spent all that much of her life up the well. Space was an acquired skill. Amos stretched, rolled on the balls of his feet, and waited until the last of the security force was out of sight. Chances were pretty slim they were going to press the issue once they’d been slapped down, but he still felt better watching them get gone.

While he was waiting, two Belters in Aldrin dockworker uniforms scurried by staying close together, their heads bowed. Luna was going to be a shitty, shitty place to be a Belter for a while, Amos thought. Still, it probably hadn’t been that great before. He headed back to the *Zhang Guo*, and the entry lock opened as he got close to it, welcoming him back in.

The ship’s interior was ugly as hell. The anti-spalling in the corridors was deep red and fake-velvet fuzzy with gold fleur-de-lis scattered over them in a weird, non-repeating pattern. The hatchways were enameled in royal blue and gold. Oversized crash couches were all over the place—in the corners of rooms, in niches in the hallways. The air recyclers added the stink of sandalwood incense without the smoke. All told, the ship was the embodiment of a stereotypical whorehouse done by a designer who’d never been to a real one. The security station was perfunctory, poorly designed, and barely stocked, but Erich’s people were placed around it as well as they could manage. Even Butch, still in pressure bandages, had a rifle with fresh rounds trained down the hallway.

“Hey,” Amos said. “We’re cool. They’re not coming in.”

The release of tension was like a soft breeze, if soft breezes came with the sounds of magazines getting pulled from assault rifles.

“Okay,” Erich said, lifting a pistol in his good hand. “Tyce. Police up all the guns. Joe and Kin, put a watch on the lock. I don’t want to be surprised if anyone shows up unexpected.”

“They won’t,” Amos said. “But hey, knock yourselves out.”

“You got a minute?” Erich said, handing the pistol to a thick-necked man who Amos figured was Tyce.

“Sure,” Amos said. They fell into step, ambling toward the lift.

“That was really the woman who’s running Earth now?”

“Until she lets ’em have an election, I guess. I never really paid much attention to how that whole thing works.”

Erich made a soft, noncommittal grunt. His bad arm was curled up against his chest, the tiny fist tight. His good hand was stuffed deep in his pocket. Both made him look like something was eating him.

“And you... You know her. Like asking-favors know her.”

“Yup.”

At the lift, Erich punched for the ops deck. It wasn’t where Amos meant to go, but it seemed like the conversation was leading toward something, so he went with it. The lift made a stuttering start, then rose gently past the high-ceilinged decks.

“I can’t tell if this thing’s a ship or a fucking throw pillow,” Amos said.

“Wouldn’t know,” Erich said. “It’s the first one I’ve been in.”

“Seriously?”

“Never been out of atmosphere before. The low-gravity thing. That’s weird.”

Amos bounced gently on his toes. It was only about a sixth of a g. He hadn’t really thought about it much. “You get used to it.”

“You did, anyway,” Erich said. “So how did you meet her?”

“We got in over our heads on some shit, and some folks she was against were trying to kill us. She came in and tried to keep us alive.”

“So now you’re friends.”

“Friendly acquaintances,” Amos said. “I don’t have all that many what you’d call friends.”

The lift stopped with a small lurch that it really shouldn’t have had. The ops deck was all dark surfaces, the decking a deep chocolate brown, the walls an artificial wood grain, the consoles and couches lined in fake leather. Or hell, maybe real leather. It wasn’t like he knew the difference to

look at. Erich lowered himself into one of the couches and ran his good hand over his scalp.

“You know,” he said. “You couldn’t have done this without us. Me and your prisoner friend. And now the head of the fucking government, which excuse me if that still breaks my head a little.”

“Well, I—”

“No, I know you would have done something. Just not this. You couldn’t have done this exact thing. This plan? For it, you needed to have us. All of us. And the only thing we had in common was you.”

Amos sat across from him. Erich wouldn’t meet his eyes straight on.

“*Plan*’s kind of a strong word for it,” he said. “I was just grabbing whatever I could.”

“Yeah, the thing is you had things to grab. I spent a lot of years in Baltimore. Know it like the back of my hand. Knew it. Now, I’ve got all my best people here and no fucking clue what here looks like, you know? Who controls the drugs around here? How do you fake an ID? I mean, I figure that underlying logic’s the same anywhere, but...”

Erich stared at the wall like there was something to see there. Amos craned his neck to look, just to be sure.

“I don’t know what we do from here. I don’t know what I do from here. I’ve got people counting on me to get them through the queen of all churns, and I don’t know where to take them or what we’re gonna do.”

“Yeah, that sucks.”

“You do,” Erich said.

“I suck?”

“You *know*. You’ve been out here. This? All this? It’s your neighborhood. You know people. You know how things work. You know how to keep people alive.”

“You may be overestimating the amount of time I’ve put into analyzing stuff,” Amos said. “I got one ship and three people. That’s been kind of a handful. All the rest of this just happened along the way.”

“But it got us here.” Erich shifted his gaze. His eyes were hard. “I’ve got enough cash squirreled away that if I get access to it, I might be able to buy a small ship. Not a good one, but something. Or relocate the team somewhere. One of the Lagrange stations or Pallas or... wherever. Start over. Make a new niche. If you want to take the lead, I’ll give it up.”

“Oh,” Amos said. “Yeah, no.”

“They’d be better off with you leading than with me.”

“Yeah, but I don’t know them enough to give a shit. I’ve got my own thing going. I’m sticking with it.”

He couldn’t tell if the release in Erich’s eyes was relief or disappointment. Maybe both. Lydia would have known. Or Naomi. Or Holden. Alex, probably. For him, it was just a little change in muscle tension. Could have meant anything.

“I’ll find my own way then,” Erich said. “We’ll be out of here in a couple days, if I can manage it.”

“Okay, then,” Amos said. It felt like there should be something more. He’d known Erich as long as he’d known anyone alive. Even if they saw each other again a time or two, the conversation they’d just had was the mark of the end. Both of their lives could have looked a lot different if Amos had said a few different words. It seemed like there should have been something to say about that. But since he couldn’t come up with anything, he went back to the lift and headed down for the machine shop.

Going to the technical end of the *Zhang Guo*—the places where the owners and their guests wouldn’t spend their time—was like stepping into a different ship. All the glitter and beauty gave way to a clean utilitarian design that wasn’t as good as the *Roci*, but better than any other ship Amos had worked. All the corners were curved and softened in expectation of impacts. All the handholds were double-bolted. The drawers and cabinets in the machine shop were latched in two planes. The air smelled like fresh filters and lubricant. Someone had kept the place clean and in better order than a glorified orbital shuttle really deserved. Amos wondered if whoever that had been was still alive. It wasn’t a question he could answer, though, so he didn’t spend a lot of energy on it.

Peaches was sitting at a workbench. The outfit they’d gotten during their bike trip to Baltimore looked pretty sketchy in the clean and tidy surroundings. Torn at the shoulder and still too big for her. She looked like she was swimming in it. Her hair was pulled back into a ponytail with a zip tie and her hands were moving quickly and carefully over an open case of modular electronics. Her movements were as precise and flowing as an old recording of a piano player at the keys. She didn’t look up as he came in, but she smiled.

“Got something for you. Salvaged a hand terminal. Nice one. Even got it talking to the local network. Finish the configuration, and you’re good to go.”

Amos pulled the seat next to her out from the body of the ship. She handed him the terminal, but still didn’t meet his eyes.

“According to Chrissie, it ain’t salvage.”

“I liberated one, then. I was going to get one myself, but I can’t. I’ve got nothing to connect to.”

“Could use it like a disposable,” Amos said, starting to key his configuration information. “Get you access to feeds anyway.”

“Does it matter?”

“Well, if you don’t think it does, then maybe not.”

She sighed. There were tears in her eyes and a smile on her face. “We did it. We made it safely to Luna. Just like we hoped.”

“Yeah.”

“You know what I really missed when I was in the Pit? Anything that actually meant anything. They fed me, and they kept me alive, and we had this kind of support group thing where we could talk about our childhood traumas and shit. But I couldn’t do anything that mattered. I couldn’t work. I couldn’t talk to people outside the prison. I was just being and being and being until sooner or later, I’d die and they’d put someone else in my cell.”

She leaned forward, her elbows on the workbench. She’d burned the side of her thumb on something—a soldering iron, the barrel of a gun, something—and the skin was smooth and pink and painful-looking. “I won’t go back there.”

“Peaches, there’s no there to go back to. And anyway, I’m pretty sure Chrissie knows you’re on board here. She’s not pushing the issue, so as long as we stay cool and act casual—”

Her laugh was short and bitter. “Then what? You can’t take me with you anymore, Amos. I can’t go on the *Rocinante*. I tried to kill Holden. I tried to kill all of you. And I did kill people. Innocent people. That’s never going away.”

“In my shop, that’s just fitting in,” Amos said. “I appreciate that seeing the crew again could leave you feeling a little antsy, but we all know what you are. What you did. Including all the shit you did to us. This isn’t new territory. We’ll talk it through. Work something out.”

“I’m just afraid that if he doesn’t back your play, they’ll send me back, and—”

Amos lifted a hand. “You’re missing some shit here, Peaches. Lot of folks seem to be. Let me lay this out again. There’s no back, and it ain’t just the real estate. The government that put you in prison only sort of exists anymore. The planet that put you in prison is going to be having billions of people die in the next little bit. Making sure you serve your whole term doesn’t mean shit to them. There’s a new Navy between us and the Ring, and there’s still a thousand solar systems out there to fuck up the way we fucked up this one. Because what you’re doing right now? Yeah, you’re worrying about how it would go for you if none of that happened. And I’m thinking that you’re doing it because you’re not looking at the facts.”

“What facts?”

“It ain’t like that anymore.”

“What isn’t?”

“Any of it,” Amos said. “With Earth puking itself to death and Mars a ghost town, everything’s up for grabs. Who owns what. Who *decides* who owns what. How money works. Who gets to send people to prison. Erich just called it the queen of all churns, and he ain’t wrong about that. It’s a new game, and—”

His hand terminal chimed. Amos looked at it. The design was nicer than his old one, but the interface was a little different. It took him a few seconds to figure out what the alert meant. He whistled between his teeth.

“What is it?” Peaches asked.

He turned the screen toward her. “Seventy messages and twenty-three connection requests. Going back to before the rock dropped.”

“Who from?”

Amos looked at the list. “Alex, mostly. A few from the captain. Fuck. I got six hours of stored video with just Alex trying to talk to me.”

Peaches’ smile was thin, but it was a smile. “At least you have people.”

Chapter Fifty: Alex

A bicycle?”

Amos leaned on the breakfast bar. “Sure. They don’t need fuel, they don’t get sick. Most of the repairs, you can handle on your own. You’re looking for post-apocalyptic transportation, bikes are the way to go.”

Alex sipped his beer. It was a local brew from a pub just down the corridor with a rich hoppy flavor and a reddish color. “I guess I never thought about it that way.”

The suite on Luna was bigger than their rooms on Tycho Station had been, but of the same species. Four bedrooms opened onto a wide, recessed common area. A wall screen bent around the curve of the room, set to an idealized lunar landscape that was more photogenic than the real one. Every now and then, an animated “alien” girl would pop out from behind a rock, look surprised, and dart away again. It was cute, he supposed, but he would have preferred the real moonscape.

“So anyway, I didn’t want to go through Washington. Too many people there, and if the pumps stopped working, I didn’t want to be pedaling through knee-high sludge, right?”

“Right,” Alex said.

Holden was on the *Rocinante*. Naomi was asleep in her room. She’d been sleeping a lot since the *Rocinante* had plucked them all out of the vacuum. The medical system said she was getting better and that the rest was good. It worried Alex, though. Not because she needed the sleep, but because maybe she didn’t actually need it and was pretending to. Being here with Holden and Amos and Naomi was a bone-deep relief. He wanted it to be the end of their separation, everything come back into its right place like nothing had ever happened.

But it wasn't. Even talking to Amos, Alex thought he could feel little differences in the man. A kind of abstraction, like he was thinking of something else all the time and only pretending to give Alex his undivided attention. Naomi had been in medical debriefing since they'd arrived, and the physicians hadn't allowed anyone in to see her except Holden. If Naomi was finding excuses to stay isolated from them, that could be a very bad sign. They still didn't know all of what she'd been through that she'd wound up with the Free Navy and then escaped from it, but that it had been a trauma seemed obvious. And so he tried to enjoy the peace and pleasure of having his crew again and ignore the anxiety growing in the back of his mind, the sense that—just like with the governments and planets and system of the solar system—things here had changed.

Amos' hand terminal chirped. He sucked down half a glass of beer then bared his teeth. "I gotta go do a thing."

"All right," Alex said, pouring the rest of his beer into the sink. "Where are we going?"

Amos hesitated, but only for a fraction of a second. "Dock. Got something I need to move into my shop."

"Great," Alex said. "Let's go."

The stations on Luna were the oldest non-terrestrial habitation humanity had. They sprawled across the face of the moon and sank below its surface. The lights set into the walls glowed with a warm yellow and splashed across vaulted ceilings. The gravity—even lighter here than on Mars or Ceres or Tycho—felt strange and pleasant, like a ship ambling on without being in a rush to get anywhere. It was almost possible to forget the tragedy still playing out a little under four hundred thousand clicks over their heads. Almost, but not quite.

Amos went on about everything that had happened while he was down the well, and Alex listened with half his attention. The details of the story would be grist for a hundred conversations once they were back in the ship and going somewhere. It didn't matter that he get all of it now, and the familiar cadences of Amos' voice were like hearing a song he liked and hadn't listened to in a long time.

At the dock, Amos looked up and down the halls until he saw someone he knew sitting on a plastic storage crate. The crate was blue with white curls of scrapes along the side like a painting of waves. The woman was

thickly built with black cornrows, dark brown skin, and an arm in a cast.

“Hey, Butch,” Amos said.

“Big man,” the woman said. She didn’t acknowledge Alex at all. “This is this.”

“Thanks, then.”

The woman nodded and walked off, her low-g shuffle a little stiffer than the people around her. Amos rented a loading mech, grabbed the crate, and started for the *Roci*, Alex trotting along beside him.

“Should I ask what’s in that?” Alex said.

“Probably not,” Amos said. “So anyway, there we are on this island where all the rich people used to be before they fucked off up the well, right? And the ships are pretty much not there...”

The *Rocinante* had an actual hangar bay complete with atmosphere, not just a space on a pad and a tube to her airlocks. The new outer hull was titanium alloy and ceramic, the polished metal and flat black paint of the hull studded with PDCs and sensor arrays. The maw of the keel-mounted rail gun was like a little surprised *o* at her bow. In the artificial light of the hangar, she looked less dramatic than she had in the unfiltered light of the sun, but no less beautiful. Her scars were gone now, but it didn’t make the ship seem less herself. Amos drove the mech to the aft airlock and cycled it open without breaking the slow, easy lope of his story. Inside, Amos lowered the crate to the deck, but didn’t turn on the electromagnetic clamps that would hold it there. Instead, he slipped out of the mech and went into the ship itself. Engineering, cargo bay, the machine shop. The stern had always been Amos’ domain.

“So those others,” Amos said. “Johnson’s people? They’re done messing with my shit now, right?”

“Yeah,” Alex said. “She’s ours again. Just ours.”

“Good.” Amos shuffled into the cargo bay.

“So the servants, the maids and chauffeurs and whatever,” Alex said. “They called security and then they just changed sides? Or... I mean how did that work?”

“Well,” Amos said, popping the latches on the crate. “We had an introduction, see?”

The folds of the crate’s lid rose of their own accord. Alex jumped back, misjudged the gravity, stumbled. A dark-haired head came up over the

crate's edge, a thin ghost-pale face with ink-black eyes. Alex's heart started going triple time. Clarissa Mao, psychopath and murderer, smiled at him tentatively.

"Hey," she said.

Alex took a long, shuddering breath. "Ah. Hey?"

"See?" Amos said, clapping the girl's shoulder. "Told you it wouldn't be a problem."

"You have to tell him," Alex said, keeping his voice low. Bobbie was telling Holden about the work she'd been doing with veterans' affairs in Londres Nova, so he wasn't paying attention to them.

"I'm gonna," Amos said.

"You have to tell him now. She's on our ship."

Amos shrugged. "She was on our ship for months when we were coming back from the slow zone."

"She was a prisoner. Because of all the people she killed. And now she's on our ship by herself."

"I'll give you that does make this situation a little different," Amos said.

"Is there a problem?" Holden asked. "What are we talking about?"

"Little something I wanted to run past you," Amos said. "It'll wait until after the dog and pony show."

The meeting room in the security compound was built in an outdated architectural fashion: open archways and wide, sky-blue ceilings with indirect light and subtle geometric patterning. Everything about it was pointedly artificial, like the idea of an afternoon courtyard without the afternoon or the courtyard. Avasarala's voice came before she did, staccato and impatient. When she stepped through one of the archways, a young, seriously dressed man at her side, Bobbie stood up. Holden followed her lead.

"—if they want a voice in the decision. We're not going to fuck around bullshit electoral posturing."

"Yes, ma'am," the young man said.

Avasarala waved that they should sit back down as she took her own

seat even as she kept talking to her assistant. “Take it to Kleinmann first. Once he’s behind me, Castro and Najjar will have the cover they need.”

“If you say so, ma’am.”

“If I say so?”

The assistant inclined his head. “With permission, Chung is in a stronger position than Kleinmann.”

“Are you second-guessing me, Martinez?”

“Yes, ma’am.”

Avasarala shrugged. “Chung, then. Now go.” As the young man left, she turned her attention to them. “Thank you all for—Where’s Nagata?”

“Medical bay,” Holden said. “The doctors are still deciding whether she’s stable enough to release.”

Avasarala hoisted an eyebrow and tapped a message onto her hand terminal. “They can make a fucking exception. I want her here. Thank most of you for coming. I’d beat around the bush and make everyone feel at home, but I’ve been in meetings for the last thirty-six hours, and I’m cranky. We’re all clear that Earth is fucked, yes?”

“Hell yeah,” Amos said.

“Good,” Avasarala said. “Then I won’t belabor the point. Along with that, the Martian Navy just shattered into tiny little pieces and Smith’s too scared to call it treason.”

“Can I ask,” Bobbie said, sitting forward. Her hands, splayed on the table, seemed like she was trying to brace herself against a blow. “How bad does that look?”

“We’re not making any official statements, especially when James Holden’s in the room. No offense, but your track record for blurting information at inopportune moments is the stuff of legend.”

“I’m getting better about that,” Holden said. “But yeah. I understand.”

“There’s a thing that happens,” Avasarala said, “when unthinkable things become thinkable. We’re in a moment of chaos. Everything’s up for grabs. Legitimacy itself is up for grabs. That’s where we are now. This turd biscuit Inaros? He’s out tooling around the Jovian moons where we can watch him play pirate. He’s made his play to set the narrative. The Belt has risen up after generations of oppression, and is now taking its rightful wah, wah, wah. The position I’m in—”

“He’s not wrong, though,” Holden said, and Avasarala’s eyes hardened.

If looks could kill, Holden would have left in a bag, but he shook his head. “If the Belters fall in line with this Free Navy thing, it’s going to be because they’re all out of any other kind of hope. The new systems and colonies—”

“Have erased their niche,” Avasarala said. “And that’s shitty, and maybe we could have found a way to support them. Put them on some kind of cooperative basic, but they put a cherry bomb up the ass of the largest functioning ecosphere in the system, and it’s going to be a while before handing them free food’s going to be an option for me, practically or politically.”

“They’re never going to shut up and take handouts,” Amos said. “Those bastards are three, four generations out there because they weren’t looking to live on basic. I’m against eugenics same as the next guy, but the Belt hasn’t been breeding for the kind of people who just kick back and see how much they can fuck and watch entertainment feeds before they die.”

“I’m aware of the cultural problem,” Avasarala said. “And as I said, it doesn’t fucking matter anyway. If they’d be willing to take it, I still couldn’t give it to them. So I have to find another way to cut the Free Navy off at the knees. But since Earth’s navy is going to be busy making sure we don’t have any more radar-invisible rocks dropping on us and Mars is in the process of ignoring that it’s suffered a minor coup, it’s going to be tricky. Tomorrow, I’m going to make an announcement. You get a preview. Lucky you.

“The United Nations, with assistance from the Mars Republic and cooperation from the OPA, is going to field a task force to address the criminal conspiracy of pirates and terrorists going under the Free Navy name. Not a war. A policing task force. And that’s where you all come into play.”

“You want me to lead it,” Holden said.

“Yes,” Avasarala said, “because literally every UN naval officer who wasn’t dishonorably discharged is suddenly unavailable. For fuck’s sake, Holden, I have crates of anti-herpes drugs that are more legitimately UN Navy than you are.”

The old woman shook her head in disbelief and disgust. Holden’s scowl was matched by a rising blush. Bobbie tried to hide her laughter, but Alex had to admit it was a little funny. Even if just to himself. Bobbie was the one to step in.

“What exactly are you looking for from us?”

“I want your presence and cooperation at the debriefing, for one thing. But more importantly, I need to know what you know. What you’ve found. We have to figure out how a third-rate gang leader managed to beat us at every turn—”

“He didn’t,” Naomi said, stepping in from under the spreading arches, a security escort at her side. In the shadowless light, she looked weirdly delicate. Her skin was peeling and she moved with the careful shifting of someone prepared for pain to come at any moment. But her sclera had faded from the blood-and-bone color to an ivory yellow that actually looked healthier, and her voice had lost the slushiness at its edges. A weight lifted from Alex’s heart.

“The prisoner, ma’am,” the security escort said.

“Yes, thank you, I noticed that,” Avasarala said, then turned her attention to Naomi. “What do you mean he didn’t?”

“Look at everything he tried to do and failed. He didn’t kill Fred Johnson. He didn’t kill Prime Minister Smith. He didn’t take Tycho Station or destroy it. The *Rocinante*’s in one piece. He didn’t keep hold of me. It’s how he works. If he wins, it was the important thing. If he loses, it just disappears.”

“And the protomolecule sample that he stole?”

Naomi blinked, seemed to lose focus for a moment, and shook her head. “He never said anything about that.”

“Would he have?”

Naomi sat in the chair beside Holden. He took her hand, and she allowed it, but her attention was on Avasarala. Alex wasn’t sure why that bothered him so much. The meeting wasn’t an invitation for the two of them to work out their relationship status. And still, if she’d been just a little less guarded with him...

“Yes,” Naomi said. “He would have. He likes to brag.” The intimacy of that one piece of information filled Alex’s chest with a sense of deep foreboding. Holden’s face was calm. Unreadable.

“Good,” Avasarala said, a sharpness in her voice. “That’s very good to know.” She considered Naomi silently. “You look like you’re feeling better. You heard some of what I was saying?”

“Enough of it,” Naomi said.

“Are you going to be able to help us?”

The question hung in the air, rich with nuance and complicated importance. Not *Why were you on his ship*. Not *How do you know him*. Not *Who are you to him that he brags about his plans to you*. Just, *Are you going to be able to help?*

“You okay?” Amos murmured.

“What? I’m fine,” she replied.

“Because you’re kinda fidgeting,” Amos said at the same time Naomi said, “I want immunity from prosecution.”

The air seemed to go out of the room. It wasn’t a confession, but it painted a picture that none of them had wanted to admit might be possible. To ask for immunity was an admission of guilt, even if they didn’t know what she was guilty of.

Avasarala’s smile was indulgent and friendly and, he was almost certain, deceptive. “Blanket immunity?”

“For all of us.”

“Who is ‘all of us’?” Avasarala said, forming the words carefully as she said them. “Your friends in the Free Navy?”

“The crew of the *Rocinante*,” Naomi said, and then stuttered. Paused. “And maybe one other person.”

Alex shot a look at Amos. Did she know about Clarissa? Was that who she meant? Amos’ smile was amiable and empty. Avasarala tapped her fingernails against the table.

“Not for Earth,” Avasarala said. “Dropping the rocks? No one gets immunity for that.”

Alex saw it hit. Tears appeared in Naomi’s eyes, brimming silver and bright. “The crew of the *Rocinante*,” she said. “The other one... I may ask for clemency and consideration later on. If the occasion arises.”

“For Inaros?”

“No,” Naomi said. “Him, you can fucking burn.”

“I need to understand this fully,” Avasarala said. “You, as a former member of Inaros’ group, are willing to exchange complete and accurate information about his activities both before and after the bombardment of Earth in exchange for blanket immunity for the crew of the *Rocinante* on any matter not related to the present attacks?” That there had been no profanity in the statement gave it a solidity that unnerved Alex.

“Yes,” Naomi said. “That’s right.”

The relief on Avasarala’s face was hard as flint. “Glad to hear you say that, dear. I was worried I’d misjudged you.” She rose to her feet, then grabbed at the table, cursing under her breath. “I miss weighing something. Half the time, I feel like I’m on a fucking trampoline. I’m going to go lie down and take a sleeping pill before I have a psychotic break, but the debriefing? It starts in the morning.”

“We’ll be wherever you want us to be,” Holden said. “We’re not going to hide anything.” He was still holding Naomi’s hand, and her fingers had curled around his. So maybe that was hopeful after all. As to not hiding anything... Well, Amos still didn’t say anything.

The meeting broke up, except that it also didn’t. Avasarala left, but the rest of them, including Bobbie, went to the security lobby, through the checkpoint, and out to the public lobby together. The sober silence gave way slowly to more mundane conversation: whether there was anyplace with food better than the mess on the *Roci*. Or if not better, at least different. Whether Naomi was up to drinking alcohol, because there was a little pub on one of the lower levels that was supposed to have some pretty good beers on offer. No one asked whether Bobbie was joining them. It was just assumed. As they shuffled and bounced in the thin gravity, Naomi and Holden kept hold of each other’s hands. Amos and Bobbie traded dirty jokes. It was the powerfully ordinary talk that gave Alex hope. For everything that had happened, that was happening, that was still looming in the unseen and uncertain future, there were still moments like these. And so maybe it would be all right despite it all.

At the wide slope of Chandrayaan Plaza, where the traffic of carts and mechs and half-skipping people turned down a wide ramp deeper into the body of the moon, Amos cleared his throat.

“So that immunity for the crew thing?”

“It wasn’t just for you,” Naomi said, making it a joke, and also not one.

“Yeah, figured,” Amos said. “But here’s the thing. I was thinking about maybe taking on an apprentice. You know, help flesh out the crew. Get some skill redundancy.”

“That’s a good idea,” Holden said. “Did you have someone in mind?”

Chapter Fifty-one: Naomi

Hell no,” Jim said when they were alone in the suite. “Absolutely no. No fucking way, no. There have got to be a billion different ways to say no, and I’d still have to cycle through them a couple times to really express the depth of no on this one. Clarissa Mao? On the *Roci*? How is that anything but a massive load of let’s-not-do-that?”

“And yet,” she said, letting herself drift down to the bed, “you told Amos you’d think about it.”

Jim tried pacing, but the slight lunar gravity made it difficult for him. He gave up and sat at the foot of the bed.

“We just got the crew back together. And Bobbie was there. I didn’t want to spoil the moment.”

“Ah. The moment.”

She closed her eyes. Everything hurt. Her skin hurt. Her eyes felt gritty and swollen. The joints in her hands and feet ached. Her knees hurt. Her fingertips felt raw and oversensitive. She had the kind of headache that expressed as a sense of profound fragility until she moved too fast, and then it throbbed. It was better now than it had been, though. And it would get better. Slowly, over the course of at least days and maybe weeks, she’d come back to herself. Or some version of herself. But even if some of the damage was permanent, she’d feel better than she did now. Not yet, but soon.

Alex, Amos, and Bobbie were gone. Out to get beer and food. Their food. Pizza or falafel or sashimi. Earth food. There wasn’t any good red kibble on Luna, or if there was, it wouldn’t be served at the kinds of places they’d go. Part of her wished she’d had the energy to go with them. Part of her wished Jim had decided to join them instead of her. Part of her was

euphoric and on the edge of tears that she was here, that she'd escaped, that it was over. She felt like her soul was a handful of dice that were still rolling, and what came up would decide the shape that the rest of her life took.

"I mean... Clarissa Mao?" Jim said. "How does anyone think that's a good idea?"

"Amos isn't afraid of monsters," she said. The words tasted bitter, but not completely so. Or no, not bitter. Complex, though.

"She is responsible for a lot of dead people," Jim said. "She blew up the *Seung Un*. Took out a quarter of the crew. And that one body they found? The one she was carrying around in a toolbox? Do you remember that?"

"I do."

"That guy was a friend of hers. She wasn't just killing faceless enemies. She was right down, look-them-in-the-eyes killing people that she knew. That she *liked*. How do you go from that to 'I know, let's ship out with her'?"

She knew she should stop him. He wasn't talking about her or the *Augustín Gamarra* or any of the other ships that had been sabotaged since using the code she wrote. He wasn't talking about Cyn, or the way he'd tried to intervene in her half-staged suicide. If he had been, there would have been more. How could she abandon her son? How could she let Filip think that she'd killed herself? How could she have kept something that important hidden from the people she said she cared about? All the sins she carried that even Clarissa Mao didn't.

She knew she should stop him, but she didn't. His voice was like tearing back scabs. It hurt to hear, and it left her exposed and raw and painful to the touch, and the pain felt good. Worse, it felt right.

"I'm not saying she should be killed. That whole thing about how if she's ever going back to prison, Amos is going to shoot her? I understand that he's joking—"

"He's not."

"Okay, I'm pretending that he's joking, but I'm not advocating killing her. I don't want her to die. I don't even want her locked up in inhumane, shitty prisons. But that's not what we're talking about. Shipping with someone means literally trusting them with your life all the time. And, okay, I was on the *Canterbury*, and we had some people there who were

deeply, deeply sketchy. But even Byers only killed her husband. Clarissa Mao set out to destroy me in particular. Me. I just... I don't... How does anyone think this is a good idea? Someone who does the things she did doesn't just change."

She took a deep breath, pulling air into her bruised lungs. They still gurgled a little, but she was on enough reflex inhibitors that she wasn't coughing herself light-headed anymore. She didn't want to open her eyes, didn't want to talk. She opened her eyes, sat up, her back against the headboard, her arms wrapped around her knees. Holden went quiet, feeling the weight of what was about to come. Naomi plucked at her hair, pulling it over her eyes like a veil, then almost angrily, she smoothed it back so her eyes were clear.

"So," she said. "We need to talk."

"Captain to XO?" he asked, carefully.

She shook her head. "Naomi to Jim."

The dread that bloomed in his eyes hurt to see, but she'd also been expecting it. She felt its echo in her own chest. It was strange that after all she'd done—all the demons she'd faced and escaped—this should still be so hard. Holden's hand terminal chimed, and he didn't even look at the screen. The lines around his mouth deepened the way they did when he'd tasted something he didn't like. His hands folded together, strong, controlled, calm. She remembered the first time they'd met, lifetimes ago back on the *Canterbury*. How he'd radiated charm and certainty and how much she'd hated it at first. How much she'd hated him for being too much like Marco. And then how much she'd come to love him for not being like him at all.

And now, she would break her rule of silence, and the thing they had between them would either survive or it wouldn't. It was a terrible thought. Marco might still be able to empty her, and he wouldn't even have to spend the effort of being aware of it. Existing was enough.

"I don't," Jim said, then stopped. He looked up at her through his eyebrows, like he was the one feeling guilty for it all. "We all have pasts. We all have secrets. When you took off, I felt... lost. Confused. Like part of my brain was gone. And now that you're here, I am just profoundly happy to see you. This right here? It's enough."

"Are you saying you don't want to know?"

“Oh lord, no. No, I’d pretty much cut off a toe. I’m pretty much made of ragingly deep curiosity and floating jealousy. But I can deal with those. I don’t have any more right to make you tell me anything you don’t want to than I ever did. If there’s anything you don’t want to say—”

“I don’t want to say any of this,” Naomi said. “But I want you to know. And so we have to get through this part, no?”

Jim shifted, pulling his legs up under him, kneeling at the foot of the bed, his face to hers. His hair was the color of coffee with just a little cream. His eyes were blue as deep water. As evening sky was supposed to be.

“Then we’ll get through it,” he said with a simple, boundless optimism that caught her by surprise and drew out laughter, even here.

“Well,” she said. “When I was in my middle teens, I was living with a woman we called Tia Margolis and burning through the engineering courses on the networks as fast as I could, and there were ships that came through dock. Belter ships. Hard-core.”

Jim nodded, and then—to her surprise—it was easy. In her mind, the idea of unpacking her past to Jim—to anyone—was a thing of anger and disgust and recriminations. Or worse, of pity. Jim, who for all his faults was sometimes capable of perfection, listened carefully and completely. She had been Marco Inaros’ lover. She’d gotten pregnant young. She’d been involved—at first without knowing it—in the sabotage of inner planets ships. She had a son named Filip who had been taken from her as a way to control her. She described the dark thoughts, and realized it was very nearly the first time she’d talked about them openly, without a veil of ironic humor. *I tried to kill myself, but it didn’t work.* Just saying the words out loud felt like being in a dream. Or waking up from one.

And then, somehow in the depth of her confession, the baring of her blighted soul that was always supposed to be a trauma and a terror, it was just her and Jim having a conversation. She’d found a way to get a message out to him during the battle, and he told her about getting it, and the conversation he’d been having with Monica Stuart, and why he’d felt betrayed by her. And then backtracked to how she’d been kidnapped, and then before that to her plan to use the protomolecule sample as a Ouija board to investigate the missing ships. And then they went back to the *Chetzemoka* and Marco’s fallback plan, which brought up the way he always nested one scheme inside another, and before she got back around to

Cyn, Alex and Amos and Bobbie were back, their voices burbling over each other like birdsong. Jim closed the bedroom door against them and, when he came back, settled beside her, his back to the headboard too.

When she did talk about killing Cyn during her jump, Jim took her hand. They were silent for a moment while she examined her grief. It was real, and it was deep, but it was also complicated with anger at her old friend and captor. She hadn't let herself be aware of that at the time, but looking back, her whole stretch on the *Pella* seemed like an exercise in retracting into herself. Except when she'd defied Marco. She remembered saying that Jim was all the things he only pretended to be, wondered whether she should tell that part of the story, and then did. Jim looked horrified and then laughed. They lost track of their stories and spent ten minutes getting the timeline back: the *Chetzemoka* left the *Pella* after Jim and Fred had already departed from Tycho, or before? He'd told Alex to go investigate the *Pau Kant* before the rocks dropped on Earth? Oh right. Okay. She got it now.

They got sleepy together, her arm curled in his. The pauses grew longer, and softer. She thought *Oh, we should really talk about Amos and Clarissa Mao*, but then she was dreaming that she was on a ship that was burning at a full g for everyone else while she was on the float. All the other people in the crew, pressed to the deck while she moved through the air, reaching the tools and ducts they couldn't get to. In the dream, Alex was explaining that it was because she had so much built-up inertia that the rest of them would take a while catching up. In context, it seemed to make sense.

She woke up. She didn't know how much later it was, but there were no more voices from the main room. Jim was curled on his side, his back against her. His breath was deep and slow. She stretched slowly, careful not to disturb him. The aches in her muscles and skin and joints felt a little better, and there was a warmth in her chest. A looseness.

For years, she'd kept her secrets. Held them like she was keeping the pin in a hand grenade. The fear and the shame and the guilt had built up without her even noticing. The things she had done wrong—and there were so many—had grown in power. Not having them gnawing at her ribs from the inside felt strange. Empty, in a way, but a peaceful kind of empty.

Not that she was suddenly made of light and happiness. Cyn was still dead because of her. Filip was still abandoned. Abandoned again. Marco was still as much a pool of anger and hatred. Nothing about that had

changed, and everything had. An old picture made into something new by replacing the frame. Jim shifted in his sleep. The thin, dark hairs on the back of his neck had a couple paler ones among them. The first touches of gray.

Something had changed between them. Not just during her sabbatical in hell, but now that she was back from her own personal underworld. She wasn't sure exactly who they were to each other, she and Jim, except that things would be different now. Because she was different, and her changing wasn't going to break him. He wouldn't try to make her stay the Naomi he'd imagined.

Things changed, and they didn't change back. But sometimes they got better.

She got out of bed slowly, shuffling to the little desk in the corner of the room. Their hand terminals were there, and the little bottle of Jim's anticancer drugs, since he wasn't on the *Roci*. She reached for her terminal, paused, and picked up his. She should ask first, but he was asleep, and she didn't want to wake him, and she didn't think he'd mind.

Monica Stuart's footage of the *Rabia Balkhi* passing through the ring gate was unexceptional. Nothing in it seemed at all strange, except for the story around it. What had Marco done with it, she wondered. Why had he started his piracy so long before the actual coup that would permit it to go large-scale? Just the effort of doctoring all the logs from Medina would be a risk he didn't need to take. Maybe it was something to do with the system the *Balkhi* was heading into...?

She shifted to her own terminal, connecting to the *Roci*'s system and putting out a series of simple pattern matching requests. It wasn't hard to do. Most of the information Stuart had been working with was public record. And optical telescopes around the system had been trained on the Free Navy since the moment Marco had started his assault on the Martian convoy. The list of systems where ships had gone missing wasn't long, but the pattern in it wasn't obvious either. She tried to remember if anyone on the *Pella* had talked about any of them: Tasnim, Jerusalem, New Kashmir. Of course, the naming conventions were also a mess. New Kashmir also got called Sandalphon, High Texas, and LM-422. She pulled up alternate names for the other systems. Now that Jim had learned the worst of her past, she was almost eager to start the debriefing with Avasarala's team, and if there

was some clue she could bring from her time on the *Pella*...

She scowled. Ran the matching schema again with different tolerances. Behind her, Jim yawned. When he sat up, the sheets made a hushing sound. The *Roci* came back with a list of possibles, and she spooled through them. The *Ankara Slough* was an approximate match for the *Rabia Balkhi*, but looking through the differences she saw the drive signatures were wrong. It would have cost less to make a new ship than to swap a whole drive complex out of an existing one. In the front room, Alex said something and Amos answered. And then—to her brief surprise—Bobbie. Jim's hand touched her shoulder.

"Hey. You all right?"

"Yeah," Naomi said. "Fine."

"How long have you been up?"

She checked the time and groaned. "Three and a half hours."

"Breakfast?"

"God, yes."

Her back protested when she stood, but only a little. Her mind felt focused and alive and wholly her own for the first time in weeks. Maybe since the first, toxic message from Marcos had come in. She wasn't at war with herself, and it felt good. But...

Jim's hair was in wild disarray, but he looked handsome in it. She took his arm. "Is something wrong?" he asked.

"Don't know," she said.

"Would coffee improve whatever it is?"

"Couldn't hurt," she said.

In the main room of the suite, Amos and Bobbie were talking about methods of unpowered travel, each of them subtly outdoing the other and both clearly aware of it and having fun. Alex grinned to her and Jim when they sat at the breakfast bar, and then poured them both demitasses of slow-pouring espresso with thick brown crème at the top. Naomi sipped, enjoying the heat and the rich complexity hidden inside the bitterness.

"You're looking better," Alex said.

"Feeling better. Thanks. Bobbie, the missing ships you were looking for. They were all MCRN, right? Navy?"

"Ships. Weapons. Supplies. The whole thing," Bobbie said. "I guess we know what happened to them now."

“No colony ships, though?”

The big woman frowned. “I wasn’t looking for any.”

“What’s up?” Jim asked.

Naomi swirled the espresso in her little bone-colored cup, watching the whorls form and vanish in the low gravity. “The missing ships come in two flavors. Military vessels from Mars that the Free Navy have now, and then colony ships that went missing on their way out to new systems. And I make sixty, maybe seventy percent matches with the Free Navy ships to old military records. I can’t find one match with the missing colony ships. I can’t see a pattern in what systems they were going to or what they were carrying. And I don’t know what hijacking them could have gained for Marco.”

Amos made a low grunting sound in the back of his throat.

“Yeah,” Naomi said, as if the sound had been words. “Something in the ring gates is eating ships.”

Epilogue: Sauveterre

I have a tracking number,” the captain of the little freight ship said for what had to be the sixth or seventh time. “I have landing papers and a tracking number straight from Amatrix Pharmaceuticals. I know the shipment arrived on Medina six months ago. I have a *tracking number*.”

Sauveterre sipped smoked tea from a bulb as he listened. He would have preferred whiskey from a glass, but he was on duty and the *Barkeith* was on the float. The first did for the whiskey, the second for the glass. Granted, the captain’s office was private and he could have done whatever he pleased. And, he supposed, he did. Keeping to his duty was a more pleasing thing for him than whiskey, which was as it should be.

“Sabez you got a tracking number, *Toreador*,” the voice from Medina Station said. “Amatrix, though? Esa es Earth-based. No Earth-based companies on Medina.”

The *Barkeith* was a *Donnager* -class battleship. A small city in space, run with machined precision and capable of turning not only the little freighter but Medina Station to particles smaller than grains of sand. But it and the rest of Duarte’s fleet were waiting for permission from traffic control on Medina to proceed through the next ring gate and begin the second, stranger leg of their journey. It was an overabundance of etiquette on the fleet’s part, but there were reasons for that. Not the least being the general reluctance to use heavy weapons too near the alien station that hung inert in the vast non-space between the rings. They weren’t ready for that to awaken again. Not yet.

A light knock came at the door. Sauveterre straightened his tunic. “Come.” Lieutenant Babbage opened the door, bracing with a handhold on its frame. She looked anxious as she saluted. Sauveterre let her hold the

position for a moment before answering her salute and allowing her to enter.

“I have been en route for ten months!” the captain of the *Toreador* shouted. “If the colony doesn’t get this shipment, they’re fucked.”

“Have you been listening to this?” Sauveterre asked, nodding toward the speakers.

“No, sir,” Babbage said. Her skin was ashen under the brown. Her lips pressed thin.

“Üzgün, *Toreador*,” Medina Station said. “You need to dock for medical, wir koennen—”

“I don’t need to dock for medical! I need my fucking supplies! I have a tracking number that puts them on your station, and I will not—”

Sauveterre cut them off and took another sip of tea. “They’ve been going more or less like that for the better part of an hour. It’s embarrassing on their behalf.”

“Yes, sir.”

“Do you know why I wanted *you* to hear it?”

She swallowed her fear, which was good, and her voice didn’t tremble when she spoke, which was better. “To demonstrate what happens when there is a breakdown in discipline, sir.”

“The end point of it, anyway. Yes. I’ve heard you violated dress code. Is that true?”

“It was a bracelet, sir. It belonged to my mother, and I thought...” Her voice trailed off. “Yes, sir. That report is true, sir.”

“Thank you, Lieutenant. I appreciate your candor.”

“Permission to speak freely, sir?”

Sauveterre smiled. “Granted.”

“With respect, sir, the dress code was MCRN regulation. If we are going to enumerate transgressions against code, there are some larger ones that might also be worthy of examination. Sir.”

“You mean like being here at all.”

Her expression was hard. She’d overplayed her hand, and she knew it. It happened. Embarrassment and the childish need to stamp her feet and say it wasn’t fair. He wouldn’t have gone there in her place. But since it was on the table, it was on the table. No way but forward.

“We are in a time of flux, that’s true. With the elected government

failing its obligations, Admiral Duarte has taken authority and responsibility for the fleet on himself. I, following the chain of command, am carrying out his orders. You, also following the chain of command, are expected to follow mine. This is an independent initiative of the fleet. It's not a free-for-all."

"Sir," she said. She meant *Yes, sir*, but she hadn't said the *yes* part.

"Do you know what happens if I write you up for your failure to follow fleet discipline?"

"I could be demoted, sir."

"You could. If things continued, you could be drummed out. Removed from duty. Dishonorably discharged. Not over this, of course. This is small, but if it became large. You understand?"

"I do, sir."

"If you were discharged, what do you think would happen?"

She looked at him, confused. He gestured with his free hand, a sweep that gave her permission to speak.

"I... don't..." she stammered.

"I don't know either," he said. "Back at Mars, you'd have been released to civilian life. But where we're going, there is no civilian life. No human life at all. Do I turn you out to fend for yourself in the local food chain? Do I spend the time and resources it would take to send you back, and then back where? The forces that have taken control on Mars would see you as a traitor just the same as they would me. They'd throw you in the brig for life unless you cooperated with them. And if you were going to cooperate with them, then it wouldn't make sense for me to send you back in the first place. Would it?"

"No, sir." He could see understanding beginning to dawn in her eyes. Only beginning to, though. Humanity was so flawed. Not just her, but everyone. Half the population was below average intelligence. Half below average dedication. Average adherence to duty. The cruel law of statistics. It was astounding that as a race they'd managed as much as they had.

"Now that we are taking initiative," he said, "it is more important than ever that we maintain strict discipline. We're like the first long-haul missions back before anyone had an Epstein drive. Months, maybe years, as a community of warriors and explorers. There's not room for outsiders when there is no outside. I know you're upset that—"

“No, sir, I’m not—”

“I know you’re upset that I’m coming down on you for something as minor as a bracelet. It seems trivial, and it is. But if I wait until it’s not trivial, we come to matters of life and death very, very quickly. I don’t have the latitude to take a cavalier position.”

“I understand, sir.”

“I’m glad to hear you say that.”

He held out his hand, palm up. Babbage wiped away a tear with the back of her hand, and then dug in her pocket for a moment. When she put the bracelet in his hand, she paused, holding it for just a second longer. Whatever it meant to her, giving it over was a sacrifice. He closed his hand on the thin silver chain with its tiny sparrow-shaped pendant. He tried to make his smile gentle as he spoke.

“Dismissed.”

When she had closed the door behind her, he turned back to his system. A new message had come in from Cortázar. His flesh crawled a little. Duarte’s pet scientist had been sending more and more messages since the Belters had pulled the trigger. The man’s enthusiasm unnerved Sauveterre. The man’s personality was firmly in the uncanny valley, and his pleasure in the project they were undertaking at the new Laconia Station had a feeling of anticipation that was almost sexual.

Duty, however, was duty. He put Babbage’s jewelry in the recycler and opened the message. Cortázar was too close to the camera or else had chosen for reasons of his own to be slightly out of focus. His wide chin and thin, black hair should have been unremarkable. Sauveterre rubbed his hands like he was trying half-consciously to wash them.

“Captain Sauveterre,” the strange little man said. “I’m pleased to report that the sample arrived intact. Thank you very much for taking custody of it after its liberation. I am, however, distressed to hear that the fleet is running behind schedule.”

“It’s a few days over the course of months,” Sauveterre said to himself and the screen. “We’ll make it up.”

“I know you are aware that both supplies and time are in short supply until the artifact has been brought to heel. In order to help make up for this shortfall, the research group has put together some plans and specifications for some of the modifications the *Barkeith* will need in order to dock with

the artifact. Several of them can be started by your engineering teams en route. And of course, if you have any questions, I am at your disposal. Cortázar out.”

The screen flipped to a series of technical drawings. There was more than enough about those to disturb him as well. They called all the alien technology by the name protomolecule, but of course, that far-traveled set of life-hijacking microparticles was only one object in a much grander toolbox. And if Cortázar had interpreted the top-clearance data from the MCRN probes correctly, what they had found would be much easier for humanity to tame and make use of.

Still, the changes Cortázar wanted for the *Barkeith* were unpleasantly organic. Less like they were fitting a new model of airlock on the ship, and more like they were carving it into some kind of colossal prosthesis.

It's the beginning of something very new and very powerful, and if good people don't step in to accept the power, bad ones will. It was what Admiral Duarte had told him the night he'd brought Sauveterre into the fold. It had been true then, and it was true now. He switched on the camera, adjusted his hair, and began recording.

“Message received. I will take the plans to my engineers at once. If they have any concerns, we will be in touch.” Short, to the point, minimalist without being rude. Efficient. He hoped it would come across as efficient. He rewatched it to be sure and considered rerecording it and changing *concerns* to *questions*, but decided he was overanalyzing it. As he sent it off, his system chimed.

“Captain, we have clearance from Medina.”

“Do we now, Mister Kogoma? Kind of them. What was the resolution of their tracking number situation?”

“The freighter is moving in to dock with the station, sir.”

Well, there was another ship for the skinnies to commandeer. If the *Toreador* had known which way the wind was blowing, they'd have hightailed it back to whatever hardscrabble planet they'd come from and tried to make do without whatever they had lost anyway. As it was, the Free Navy would just keep gobbling up the ships that came through, starving out the colonies. Weakening them. By the time the Belters figured out they were fighting a rearguard action against history, Duarte would be in position.

War, Sauveterre thought as he pulled himself to the command deck, had long since ceased to be about controlling territory. The job of a military was to disrupt its enemies. Generations of low-scale war in the Belt hadn't been an attempt to hold Vesta Station or Ceres or any of the dozens of little floating supply hubs in the vast emptiness. It had always and only been about keeping the OPA or any other Belt force from coalescing into an organized force. Until the rules changed, and that organized force became useful. The Free Navy would have made itself decades before if men like Duarte had let it. Now that the Belt finally had it, they would find just how useless it was.

As long as it kept Earth and what was left of Mars busy for a few years. After that... The reward of audacity was the chance to steer history.

The command deck was in trim. Everyone in their couches, the displays freshly cleaned, the controls polished. The *Barkeith* would arrive at Laconia Station as smart and sharp as she had left Mars. And they wouldn't be wearing bracelets. He drew himself down to his command station and strapped himself in.

"Mister Taylor, sound the acceleration alert. Mister Kogoma, inform the fleet and Medina Station that we are proceeding."

"Sir," the tactical officer said, "permission to open weapon ports."

"Are we expecting action, Mister Kuhn?"

"Not expecting, sir. An abundance of caution."

Kuhn didn't trust the skinnies either. That was fair. They were a bunch of thugs and cowboys who thought that because they had guns, they had power. Sauveterre thought it was early for the Free Navy to start double-crossing Duarte, but they were stupid and impulsive. It didn't do to assume an amateur force would make the same decisions as a professional. "Permission granted. And warm up the PDCs while you're at it. Mister Kogoma, please advise the fleet to do likewise."

"Yes, sir," Kogoma said.

The Klaxon sounded and Sauveterre settled into his couch, the sensation of weight returning over the course of seconds. The transit to the Laconia ring was short. The space between the rings was almost claustrophobic compared with the vastness of real, open vacuum. And dark. Starless. The physics wonks said that there wasn't any space on the other side of the rings. That whatever bubble they all existed in ended not in a barrier, but in

some more profound manner that he couldn't picture. He didn't need to.

The Laconia gate drew closer, a handful of stars burning solid and clear on the other side of it, and growing as they came near. The exhaust plumes of the fleet vanguard glowed brighter as they passed through. There would be new constellations there. A different angle on the galaxy, like a whole new sky.

"Approaching the ring, sir," Keller said from the navigation controls. "Passing through in three. Two..."

Keller fell apart. No, that wasn't right. Keller was where she had been, sitting as she had been sitting. But she was a cloud now. All of them were clouds. Sauveterre held up his hands. He could see them so perfectly: the ridges of his fingertips, the spaces between the molecules, the swirl and flow of his blood beneath them. He could see the molecules in the air—nitrogen, oxygen, carbon dioxide all bouncing madly against each other, obscuring some more profound space between them. A vacuum that penetrated them all.

I'm having a stroke, he thought. And then, *No. Something else is wrong.*

"Kill the drive!" he shouted. "Turn about!" And the waves of his words passed through the visible but invisible air in an expanding sphere, bouncing against the walls, shuddering where they intersected with the cries of fear and a blaring Klaxon. It was beautiful. The cloud that was Mister Keller moved her hands and miraculously didn't slip through the vast emptiness of her control deck.

He saw the sound coming in the rush of molecules before it reached him and he heard the words. "What's going on? What's happening?"

He couldn't see the image on the screens to know if the stars were there. All he could sense were atoms and photons of the thing itself, not the pattern they made. Someone was screaming. Then someone else.

He turned and saw something move. Something *else*, not another cloud like himself, like the others, like matter. Something solid but obscured by the emptiness of material like a shape in the fog. Many shapes, neither light nor dark, but some other thing, some third side of that coin, passing through the spaces between the spaces. Rushing toward them. Toward him.

Sauveterre did not notice his death.

Acknowledgments

While the creation of any book is less a solitary act than it seems, the past couple of years have seen a huge increase in the people involved with The Expanse in all its incarnations, including this one. This book would not exist without the hard work and dedication of Danny and Heather Baror, Will Hinton, Tim Holman, Anne Clarke, Ellen Wright, Alex Lencicki, and the whole brilliant crew at Orbit. Special thanks are also due to DongWon Song and Carrie Vaughn for their services as beta readers, Ben Jones and Jordin Kare for their help figuring out what happens when a thruster misfires, and also to the gang from Sakeriver: Tom, Sake Mike, Non-Sake Mike, Porter, Scott, Raja, Jeff, Mark, Dan, Joe, and Erik Slaine, who got the ball rolling.

The support team for The Expanse has also grown to include Sharon Hall and Ben Roberts, Bill McGoldrick, Mark Fergus, Hawk Ostby, and Naren Shankar among many, many others at Alcon Television, the Sean Daniel Company, and Syfy. Especially Alan for the Boom Coffee and Kenneth for essentially everything else.

And, as always, none of this would have happened without the support and company of Jayné, Kat, and Scarlet.

**JAMES S. A.
COREY**

**THE
VITAL
ABYSS**

AN **EXPANSE** NOVELLA

Somewhere in the vast expanse of space, a group of prisoners lives in permanent captivity. The only company they have is each other and the Belters who guard them. The only stories they know are the triumphs and crimes that brought them there. The only future they see is an empty life in an enormous room. And then the man from Mars came along...

The Vital Abyss

THEY kept us in an enormous room. Ninety meters by sixty with a ceiling eight meters above us, a bit less than a football pitch, with observation windows along the top two meters all the way around from which our guards could look down on us if they chose to. Old crash couches salvaged from God knew where lay scattered around the floor. Eventually I came to recognize a certain subtle smell like alcohol and plastic when the air scrubbers were replaced, and the humidity and temperature would sometimes vary, leaving runnels of condensate coming down the walls. Those were the nearest things we had to weather. The gravity, somewhere in the neighborhood of one-quarter g, suggested we were on a spin station. Our guards never said as much, but I could think of no planetary bodies that matched that.

For most of us there was a sense that this shabby, empty room was the final destination for us, the former science team from Thoth Station. Some wept at the thought. The research group did not.

We had toilets and showers, but no privacy. When we washed ourselves, it was in front of anyone who cared to observe. We learned to shit with the casualness of animals. When, as was inevitable, we began to turn to each other to fulfill our sexual needs, it was without the veneer of privacy we had once enjoyed, though eventually several of the crash couches were sacrificed to create a small area visually cut off from the rest of the room and that we began calling “the hotel.” There was never anything sufficient

to absorb sound. Our enforced physical intimacy with one another was a source of shame for many of the prisoners who didn't come from the research groups. Those of us who had—myself included—held a different perspective. I think our shamelessness was part of what made it hard for the others, the ones who had worked security or maintenance or administration, to accept us. There were other reasons too, but I think the shamelessness was the most visible. I might be wrong about that. I have learned to question my assumptions about what other people feel.

The lights in the room went on at what became morning, turned off again at what we agreed to call night. Water, we took from a pair of spigots beside the showers, drinking directly from them using our own cupped hands. For want of razors or depilatories, the men among us grew beards. Guards and jailers would come through whenever they saw fit, armor-clad and carrying guns sufficient to slaughter us all. They brought Belter food, vat-grown and yeasty. Sometimes they joked with us, sometimes they pushed us away or beat us, but they always brought us sustenance and the thin paper jumpsuits that were our only clothes. All of our guards were Belters, with the elongated bodies and slightly enlarged heads that spoke of childhoods in low gravity and long exposure to the pharmaceutical cocktails that made such lives possible. They spoke in the polyglot cant of the Belt: a hundred different vocabularies all crushed together until understanding it was as much music appreciation as grammar.

During the first year, they occasionally took us out of the room for periods of interrogation. The times that I was taken, the sessions were held in small, dirty rooms, often without chairs. The techniques varied from threats and violence, to offers of privileges, to a thin-faced woman who just sat in silence and stared at me as if she could force me to speak through raw, unspoken will. As time went on, these occasions grew fewer and farther between. Sometime in the third year, they stopped entirely, and the room became the totality of our collective world. We were a community of thirty-seven people living under the eyes of cold and unsympathetic jailers.

Though we came to know each other quite well, the taxonomy of our previous employment remade itself into a kind of tribalism. Van Ark and Drexler might disagree about everything from the best use of our “daylight”

time to who had starred in the entertainment videos of our youth, but they had both been maintenance, and so when any conflict arose, they took each other's side against the rest of us. Fong had enjoyed the highest rank among the security team in our random organizational slice, and so she was not only the unspoken head of that group but through them the ersatz leader of our community. Research was kept separate, and even then divisions by work group made a web of subdivisions. Of the several dozen large signaling and communications work group, only Ern and Ma had come to the room. Imaging was the largest with five: Kanter, Jones, Mellin, Hardberger, and Coombs. Nanoinformatics had three: Quintana, Brown, and myself.

Of the system outside the room—Earth and Mars and the Belt—we knew essentially nothing. For us, history had ended on Thoth Station with our experiment on Eros only half-done. Even years after the fact, I would find myself ruminating on some peculiarity of the dataset. I no longer trusted my memory enough to say whether the issues that absorbed my hours were accurate or figments of my somewhat fragile and altered mind.

During my bitterest times, I would lie in a crash couch for days at a time, thinking of Isaac Newton and the way that, by having his mind and his peculiar history, he had refashioned all of human understanding. I had stood on a precipice as great as his and been pulled back against my will. But more often, I was able to ignore such thoughts for weeks, sometimes months, at a time. I took a lover. Alberto Correa. He worked in administration and spent his childhood taking odd jobs at the spaceport complex at Bogotá. He had an advanced degree in political literature, and he said both my names—Paolo and Cortázar—reminded him of authors he had studied. He would talk for hours sometimes about the effects of class systems on poetic forms or Butler-Marxist readings of the action videos of Pilár Eight and Mikki Suhanam. I listened, and I like to think I absorbed some of it. The sound of his voice and the presence of his body were comforting, and the moments we spent together in the hotel were pleasant and calming. He said that if he'd known he would end here, he'd have stayed on Earth and lived on basic. When I pointed out that then he and I

wouldn't have met, he would either agree that I made it worthwhile or else tell me about the beautiful men he had loved in Colombia.

Time, of course, became difficult to track, but I was fairly certain we were into the fourth year in the room when Kanter died. He'd been complaining of feeling ill, then grew agitated and delusional. The guards, seeing all as they did, brought medicine that I suspect was merely a sedative. He died a week later.

It was the first death, and reinforced to us the idea that we would likely never again be free. I watched as the others went through a period of mourning that was less for Kanter than for the lives we'd had and left behind. Not the research group, but the others. Alberto became a much more ardent lover for a time, and then lapsed into a funk in which he barely spoke to me and shied away from my touch. I was patient with him because I found patience easier when there was no alternative.

Day by day, we were ground down. Our experiential worlds narrowed to who was having sex with whom, whether someone's comment about a fellow inmate was innocuous or provocative, and fighting—sometimes violently—over who among us slept in which of the crash couches. We were petty and cruel, despairing and restless, occasionally humane and even capable of moments of actual if ephemeral beauty. Perhaps all periods of prosperity and calm go unnoticed when they occur. Certainly I didn't look on those days with any fondness until after the Martian came.

I didn't see him arrive myself. I was talking with Ernzt when it happened, so my introduction to the man was Quintana barking my name. When I turned, the Martian was simply there. He was pale-skinned with nut-brown hair and a bad complexion, and he wore the familiar uniform of the Martian Congressional Republic Navy. Our customary Belter guards flanked him, chins lifted a bit higher than usual. Quintana and Brown stood before them, waving me impatiently to them. I didn't hesitate. The pull of something new after so much sameness called forth an excitement that left my hands trembling. I plucked at my beard as I strode over, hoping against all reason that it would make me look more respectable. When we stood before the new man, the three of us together, Brown took a little half-step ahead. I stifled the urge to move forward as well, certain that it would end

in all of us crowding in on our visitor. I would swallow Brown's little physical dominance play in order to keep the Martian from leaving.

"This is all of them?" he said. He had a pleasant voice, barely accented with the drawl of the Mariner Valley.

"Bist," the Belter guard said with a nod. "Nanoinformatic, you wanted. This them."

The Martian looked at us each in turn, studying us like we were fresh recruits. It felt as if the floor was shuddering, but it was only my body. There was always an electricity in the unknown, a sense of impending revelation like the last moments before orgasm. Seeing this man and being seen by him, I felt more naked than I had since my first sexual experiences; though the longing and desire sprang from my heart and throat now, they were as commanding. All the things that the room had taken from me—my curiosity, my hope, my sense that a life outside of my nameless prison was possible—were distilled into his cool brown eyes. One of the occupational hazards of my career path is a kind of solipsism, but I truly felt at that moment that God had sent an angel to deliver me and whisper the secrets that had been hidden from me so long into my ear, which made the actions that followed so devastating.

"All right," the Martian said.

The filthy little half-step Brown had taken reaped its reward. The Martian took a dedicated hand terminal from his pocket and held it out. "Take a look at this. See what you make of it."

Brown snapped it up. "I will have a reaction prepared, sir," he said, as if he were team lead again and not a filthy, long-bearded captive in a paper suit.

"Can we have copies?" Quintana asked.

I was going to add my voice to his, but the guard cut me short. "One trade, one terminal. *Sus no neccesar.*"

The Martian turned to leave, but Quintana surged forward. "If you need someone to interpret data for you, Brown's not the right person. He was only team lead so he could spend more time talking to administration. If he'd been a better mind, they'd have kept him in the *labs*." The same sentiment was forming in my own throat, but my hesitation in finding the

words saved me. The nearest of the Belter guards shifted his weight, turned, and sank the butt of his rifle into Quintana's gut, folding him double. The Martian scowled, disapproving of the violence, but he did not speak as the guards led him to the doorway and out of the room. Brown, his beard jutting and his face flushed, half-ran and half-strutted to the hotel, the hand terminal clutched to his chest. Triumph and fear widened his eyes. Quintana retched, and I stood over him, considering. The others watched from all around the room, and when I looked up, there were more figures behind the glass staring down at us. At me.

Quintana had made a mistake, and one I would have made as well. He'd called the Martian's judgment—capricious as it was—into question. He'd tried to take a position of authority when we were all here specifically because we had no authority. Seeing that was like remembering something I'd forgotten.

One trade, one terminal. The words meant two things to me: first, that after all this time someone was trading for either our freedom or possession of us, and second, that only one of us would be required. Needless to say, I determined in that moment that the traded prisoner would be me.

"Come on," I said, helping him to his feet. "It's all right. Come on, and I'll help you get washed up." I let them see me assist him. With any luck it would get back to the Martian that one of the three was a team player, the kind of man who helped someone when they were down. Quintana, I felt sure, had lost his chance. Brown, by having the hand terminal and whatever was on it, was ahead. I didn't see yet how to arrange things so that I could gain the advantage, but simply having a real problem to solve again felt like waking up after a long and torpid sleep.

Brown didn't leave the hotel for the rest of the day, and while he did venture out when the guards brought our evening rations, he sat apart, the hand terminal stuck down the neck of his jumpsuit. Quintana glowered at him from under storm cloud brows and I kept my own counsel, but the effect of the day's actions went well beyond the three of us. Everyone in the room buzzed. There was no other subject of conversation. Mars knew we were here, and what was more, they wanted something of us. Or at least of

one of us. It changed everything from the taste of the food to the sound of our voices.

Keep a man in a coffin for years with just enough food and water to live, and then—just for a moment—crack the lid open and let him see daylight. We were all that man, stunned and confused and elated and afraid. The numbness of captivity fell away for a few hours, and we lived that time deeply and desperately.

After the meal, Brown retreated to a crash couch near the wall, curling into it so that no one could sneak up behind him. I, pretending nothing had changed, went through my customary nighttime rituals—voiding my bowels, showering, drinking enough water that I would not wake thirsty before the lights came back. By the time our sudden toggle-switch nighttime came, I was curled in my couch with Alberto. His body was warm against my own. Brown, whose movements I had become profoundly aware of, remained in his crash couch by the wall. The glow of the terminal was dim as an insult. I pretended to sleep and thought I had fooled Alberto until he spoke.

“And so they’ve thrown us the apple, eh?”

“The fruit of knowledge,” I said, but I had misunderstood which apple he meant.

“Worse than that, the golden one,” he said. “Private property. Status. Now it’s all going to be about fighting over who’s the prettiest one, and war will come out of it.”

“Don’t be grandiose.”

“It isn’t me, it’s history. Differences in status and wealth are always what drives war.”

“Have we been a Marxist paradise this whole time and I didn’t notice?” I said, more acidly than I’d meant to.

Alberto kissed my temple and brushed his lips along my hairline to the cup of my ear. “Don’t kill him. They’ll catch you.”

I shifted. In the darkness, I couldn’t see more than a limn of his face, floating over me. My heart beat faster and the coppery taste of fear flooded my mouth. “How did you know what I was thinking?”

When he answered, his tone was soft and melancholy. “You’re from *research*.”

I wasn’t always the thing I became. Before I was *research*, I was a scientist who had educated himself into too fine a specialty. Before that, a student at Tel Aviv Autonomous University, caught between investing in a future I couldn’t imagine and losing myself in a grief I couldn’t fully encompass. Before that, I was a boy watching his mother die. I was all of those men before I was a researcher for Protogen corporation based on Thoth Station. But it is also true that I remember many of those former selves with a distance that is more than time. I tell myself that remove allows me to trace the path from one to another, but I’m not sure that this is true.

My mother—a heart-shaped face above a pear-shaped body who rained love on me as if I were the only one in the world who mattered—lived on basic most of her life, sharing a room in a UN housing complex at Londrina. She wasn’t educated, though I understand she was a good enough musician when she was younger to play in some local underground bands. If there were recordings of her on the network, I never found them. She was a woman of few ambitions and tepid passions until she reached thirty-two. Then, to hear her tell it, God had come to her in her sleep and told her to have a baby.

She woke up, marched to the training center, and applied for any program that would earn her enough money to legally go off contraception. It took her three years of fourteen-hour days, but she managed it. Enough money for both a licensed child and the donation of germ plasm that would help begin my life. She said that it was her choice to purchase sperm from a trading house that gave me my intelligence and drive, that the only fertile men in the housing complex were criminals and thugs too far outside of civilization to be on the basic rolls, and that I couldn’t have gotten it from her because she was lazy and stupid.

As a child, growing up, I used to fight back on the last point: She was smart and she was beautiful and anything good about me surely had its

roots in her. I believe now she used to denigrate herself in front of me in order to hear praise from someone, even if it was only a beloved child. I don't resent the manipulation. If intellect and focus were indeed the legacies of my invisible father, emotional manipulation was my mother's true gift, and it was as valuable. As important.

Because I was an adolescent when it began, I did not notice her symptoms until they were fairly advanced. My time was largely spent out of the house by then, playing football at a dirt-and-weed pitch south of the housing complex, running badly designed experiments with some garage-level makers and artists, exploring my own sexuality and the limits of the young men of my cohort. My days were filled with the smell of the city, the heat of the sun, and the promise that something joyous—a football win, a good project, a transporting affair—might come at any moment. I was a street rat living on basic, but the discovery of life was so rich and dramatic and profound that I wasn't concerned with my status in the larger culture. My social microenvironment seemed to stretch to the horizon, and the conflicts within it—whether Tomás or Carla would be goalie, whether Sabina could tweak off-the-shelf bacterial cultures to produce her own party drugs, whether Didi was homosexual and how to find out without courting humiliation and rejection—were profound dramas that would resonate through the ages. When, later, my project lead said *There is a period of developmental sociopathy in every life*, this is the time I thought of.

And then my mother dropped a glass. It was a good one, with thick, beveled sides and a lip like a jelly jar, and when it shattered, it sounded like a gunshot. Or that's how I remember it. Moments of significance can make maintaining objectivity difficult, but that is my memory of it: a thick, sturdy drinking glass catching the light as it fell from her hands, twirling in the air, and detonating on our kitchen floor. She cursed mildly and went to fetch the broom to sweep up the shards. She walked awkwardly and fumbled with the dustpan. I sat at the table, an espresso growing cold in my hands while I watched her try to clean up after herself for five minutes. I felt horror at the time, an overwhelming sense of something wrong. The metaphor that came to me in the moment was my mother was being run remotely by someone who didn't understand the controls very well. The worst of it was her

confusion when I asked her what was wrong. She had no idea what I was talking about.

After that, I began paying attention, checking in on her through the day. How long it had been going on, I couldn't say. The trouble she had finding words, especially early in the morning or late at night. The loss of coordination. The moments of confusion. They were little things, I told myself. The products of too little sleep or too much. She spent whole days watching the entertainment feeds out of Beijing, and then stayed up all night rearranging the pantry or washing her clothes in the sink for hours on end, her hands growing red and chapped from the soap as her mind was trapped, it seemed, by minor details. Her skin took on an ashen tone and a slackness came to her cheeks. The slow way her eyes moved reminded me of fish, and I began having the recurring nightmare that the sea had come to take her, and she was drowning there at the breakfast table with me sitting beside her powerless to help.

But whenever I talked about it, I only confused her. Nothing was wrong with her. She was just the same as she had ever been. She didn't have any trouble doing her chores. She wasn't uncoordinated. She didn't know what I was talking about. Even as her words choked her on their way out, she didn't know what I meant. Even as she listed like a drunk from her bed to the toilet, she experienced nothing out of the ordinary. And worse, she believed it. She genuinely thought I was saying these things to hurt her, and she didn't understand why I would. The sense that I was betraying her through my fear, that I was the cause of her distress rather than only a witness to something deeply wrong, left me weeping on the couch. She wasn't interested in going to the clinic; the lines there were always so long and there was no reason.

I got her to go the day before Ash Wednesday. We arrived early, and I had packed a lunch of roast chicken and barley bread. We made it to the intake nurse even before we ate, and then sat in the waiting area with its fake bamboo chairs and worn green carpet. A man just older than my mother sat across from us, his hands in fists on his knees as he struggled not to cough. The woman beside me, my age or younger, stared straight ahead, her hand on her belly like she was trying to hold in her guts. A child wailed

behind us. I remember wondering why anyone who could afford to have a child would bring it to a basic clinic. My mother held my hand, then. For hours we sat together, her fingers woven with mine. For a time I told her everything would be all right.

The doctor was a thin-faced woman with earrings made of shell. I remember that her first name was the same as my mother's, that she smelled of rose water, and that her eyes had the shallow deadness of someone in shock. She didn't wait for me to finish telling her why we'd come in. The expert system had already pulled the records, told her what to expect. Type C Huntington's. The same, she told me (though my mother never had), that had killed my grandfather. Basic would cover palliative care, including psychoactives. She'd make the notation in the profile. The prescriptions would be delivered starting next week and would continue as long as they were needed. The doctor took my mother's hands, urged her in a rote and practiced tone to be brave, and left. Off to the next exam room, hopefully to someone whose life she might be able to save. My mother wobbled at me, her eyes finding me only slowly.

"What happened?" she asked, and I didn't know what to tell her.

It took my mother three more years to die. I have heard it said that how you spend your day is how you spend your life, and my days changed then. The football games, the late night parties, the flirtation with the other young men in my circle: all of it ended. I divided myself into three different young men: one a nurse to his failing mother, one a fierce student on a quest to understand the disease that was defining his life, and the last a victim of depression so profound it made bathing or eating food a challenge. My own room was a cell just wide enough for my cot, with a frosted glass window that opened on an airshaft. My mother slept in a chair in front of the entertainment screen. Above us, a family of immigrants from the Balkan Shared Interest Zone clomped and shouted and fought, each footfall a reminder of the overwhelming density of humanity around us. I gave her ramen soup and a collection of government pills that were the most brightly colored things in the apartment. She grew impulsive, irritable, and slowly lost her ability to use language, though I think she understood me almost to the end.

I didn't see it at the time, but my options were to weave myself a lifeline from what I had at hand, abandon my mother in her final decline, or else die. I would not leave her, and I did not die. Instead I took her illness and made it my salvation. I read everything there was on type C Huntington's, the mechanism as it was understood, the research that was being done with it, the treatments that might someday manage it. When I didn't understand something, I found tutorials. I sent letters to the outreach programs of medical care centers and hospitals as far as Mars and Ganymede. I tracked down the biomakers I had known and drilled them with question—What was cytoplasmic regulation delay? How did mRNA inhibitor proteins address phenotypic expressions of primary DNA sequences? What did the Lynch-Noyon synthesis mean in respect to regrown neural tissues?—until it was clear they didn't understand what I was saying. I dove into a world of complexity so deep even the research watsons couldn't encompass it all.

What astounded me was that the cutting edge of human knowledge was so close. Before I educated myself, I assumed that there was a great depth of science, that every question of importance had been cataloged, studied, that all the answers were there, if only someone could query the datasets the right way. And for some things, that was true.

But for others—for things that I would have thought so important and simple that everyone would have known—the data simply wasn't there. How does the body flush plaque precursors out of cerebrospinal fluid? There were two papers: one seventy years out of date that relied on assumptions about spinal circulation that had since been disproved, and one that drew all its data from seven Polynesian infants who had suffered brain injuries from anoxia or drug exposure or trauma.

There were explanations, of course, for this dearth of information: Human studies required human subjects, and ethical guidelines made rigorous studies next to impossible. One didn't give healthy babies a series of monthly spinal taps just because it would have been a good experimental design. I understood that, but to come to science expecting the great source of intellectual light and step so quickly into darkness was sobering. I began to keep a book of ignorance: questions that existing information could not

answer and my amateurish, half-educated thoughts about how answers might be found.

Officially, my mother died of pneumonia. I had learned enough to understand what each of her drugs did, to read her fate from the pills that arrived. I knew by their shapes and colors and the cryptic letters pressed into their sides when the vast bureaucracy that administered basic health care had moved her from palliative care to full hospice. In the end, she was on little more than sedatives and antivirulence drugs. I gave them to her because it was what I had to give her. The night she died, I sat at her feet, my head resting on the red wool blanket that covered her wasted lap. Heartbreak and relief were my soul's twin bodyguards. She moved beyond pain or distress, and I told myself the worst was over.

The notification from basic came the next day. With my change in status, the rooms we had been in were no longer appropriate. I would be reassigned to a shared dormitory, but should be prepared to relocate to São Paulo or Bogotá, depending on availability. I thought—mistakenly, as it turned out—that I wasn't ready to leave Londrina. I moved in with a friend and former lover. He treated me gently, making coffee in the mornings and playing cards through the empty afternoons. He suggested that it might be less that I needed to stay in the city of my birth, the city of my mother, and more that I needed some control over the terms of my departure.

I applied to apprentice programs at London, Gdansk, and Luna and was rejected by all of them. I was competing against people who had years of formal schooling, political connections, and wealth. I lowered my expectations, searching for uplift programs that aimed specifically for autodidacts who had been living on basic, and six months later, I arrived in Tel Aviv and met Aaron, a former Talmudic scholar who had researched his way to atheism and was now my dorm mate.

The third night, we sat together on our little balcony looking out over the city. It was sunset, and we were both a little high on marijuana and wine. He asked me what my ambitions were.

"I want to understand," I told him.

He shrugged only his left shoulder. "Understand what, Paolo? The mind of God? The reason for suffering?"

“Just how things work,” I said.

• • ● • •

It became clear immediately that Brown had become the most important person not only among the nanoinformatics group or even research in general, but in the entire room. Over the following days, Fong, who had never treated anyone in research as better than suspicious, deferred to him when the guards brought food. Drexler sat near him before lights-out, laughing at anything he said that might pass for a joke. When Sujai and Ma fell into one of their singing mock competitions, they invited Brown in, though he demurred.

Speculation ran in all directions: We would be extradited and tried for the dead Martians on Phoebe; the company had found diplomatic channels to negotiate for our release; the Outer Planets Alliance and the Martian Republic were at war and our fates were going to be part of the settlement. My own theory—the only one that really made sense to me—was that the experiment had been running all this time and something new had happened. Grave or miraculous, it carried a weight of importance and inscrutability that brought us back from our forgotten place in a Belter prison and into the light. The Martian had come because he needed the things that only we knew, and possibly needed it badly enough to overlook our previous sins. In the observation windows above us, guards appeared more often now, usually with their attention fixed on Brown. It was not only the prisoners who found his new status of interest.

Brown himself changed, but not in the way others might have. While I believe he made use of the opportunities his new status afforded him, he did so rationally. He didn’t hold himself more grandly, did not deepen the timbre of his voice. He did not hold court or bask in the new attention given to him. Humanity is social, and the self-image of humans is built from the versions of ourselves we see and hear reflected in others; that this is not true of the research group—of Coombs or Brown or Quintana or me—was, after all, precisely the point. Instead, Brown balanced his new power with the new risks it carried. He made an unofficial alliance with Fong, staying near

her and her people so that, should Quintana or I try to take the hand terminal by force, there were others who could interfere in an attempt to curry favor with him.

Van Ark responded by eating and sleeping closer to Quintana and Alberto and myself. He'd had no love of Brown, and treated his elevation as an insult. The room was pulling itself apart like a cell preparing to divide. Brown and the Martian's hand terminal formed one locus. Quintana and I, the other.

We planned our theft quietly. When Brown sat bent over the terminal, he could not watch us talk, but Quintana and I were discreet all the same. I squatted at the side of a crash couch while he lay in it, facing away from me. The metal and ceramic made too hard a backrest, my spine aching where it pressed. I tried not to move my lips while we spoke. Fong, I felt sure, noticed us, but did nothing. Or perhaps she didn't see us. Fear kept me from looking around to find out.

"He has to sleep," Quintana said.

"He also has to wake up," I said, recalling Alberto's advice.

Quintana shifted on the couch, the gimbals hissing as the cup of the couch readjusted. Across the room, Brown sat near the hotel. The hand terminal flickered, throwing subtle shadows onto his cheeks and the hollows around his eyes. With the right equipment, I could have modeled his face, its reflectivity, and rebuilt the image he was looking at. I realized that Quintana had been speaking, and I didn't know that he'd said. When I asked him to repeat himself, he sighed with a sound very much like the gimbals.

"Once I get it, you hide it," he said. "They'll question me. Search where I went. Then they'll have to give him another copy. Once that happens, we'll be safe. They won't care anymore. You can get it back out and give it to me. You won't even have to get in trouble."

"Won't they punish us?"

"He'll have the copy. Why would anyone care about the original?"

I suspected that analysis had some holes in it, but I didn't object, out of concern that Quintana would grow impatient and scrap the plan. I resolved instead to ask Alberto if he thought the stolen hand terminal would be

trivial once a copy was delivered, but as things fell out, I didn't have the chance. Navarro, one of Fong's leadership from security, walked toward us. I coughed, alerting Quintana, and he changed to talking about the nutritional value of Belter food compared to the fare we'd had before the room, and the probable health effects that we could expect from our systematic malnutrition. Navarro sat at the next couch over, watching the guards at the window watch us. She didn't say anything. She didn't need to. The message—you're being watched—was clear.

That afternoon, the guards came early and took Brown away. They offered no explanation, simply found him there among us, nodded to the doors they'd entered through, and escorted him away. I watched him leave. My heart was in my throat, and I was certain it was already too late. If they were taking him to the Martian, he might never come back. When Brown returned to the room just before nightfall, confusion and worry pressed on his brow, but he carried the hand terminal with him.

That night as we curled up to sleep, I told Alberto of my fear that Brown and the hand terminal might vanish before I could see what was on it.

"Better if it did," Alberto said, holding my hand. I didn't know if he meant that with the irritant of hope gone, the room could return to something like its resting state, or something more personal between the two of us. I intended then to sound him out about Quintana's plan, but he had other intentions that were more urgent and immediate, and when we were spent, I curled in his arms, warm and content in the way that being a masculine animal allows.

Either Brown's temporary absence spurred Quintana to action sooner than planned, or he had told me his timetable when my attention was elsewhere. The first I knew that action had been taken was the screaming, then pelting footfalls going one way and the next. I tried to stand, but Alberto impeded me, and then, from the darkness, a dim glow. The plate of a hand terminal, moving toward me. Quintana loomed up out of the darkness, pressing hard ceramic into my hand. He didn't speak, but ran on past me. I curled back with Alberto and waited. Brown was shrieking now, his voice bansheeing up until it threatened to rise above the wavelengths of

human perception. And then Fong. And then Quintana proudly announcing that Brown didn't deserve the data, couldn't understand the data, and was going to doom us all to living and dying in the room out of his own misplaced pride.

I lay with my head against my lover's shoulder, the hand terminal tucked beneath our bodies, while the other prisoners screamed and fought in the darkness, the first open combat in the war Alberto had foreseen. The Belter guards did not come. I felt sure their absence meant something, but I couldn't say what.

I didn't want to leave the relative safety and warmth of the crash couch, but I knew that the battle raging in the darkness was also my best cover. Quintana's belief that I wouldn't be questioned because he had taken the credit for stealing the terminal seemed optimistic to me. Worse, it seemed like the kind of asserted reality—the willful decision to believe that people would act the way you preferred that they would—that posed a constant threat to those of us in research. I slid the terminal down the front of my already open jumpsuit and moved to rise from the couch, hoping the sound of the gimbals would be lost under the shouting.

Alberto took my hand for the space of a breath, and then released it. “Be careful,” he whispered.

As I moved through that darkness, the room felt even bigger than it was. I had the most precious thing in my life pressed against the skin of my belly while men and women whose voices I knew intimately, the compatriots of my years-long captivity, threatened and defied and wheedled and cried out in sudden pain. Like a stage magician's arcing gesture, they commanded the attention and gave me the cover to do what needed to be done. I slid the hand terminal under one of the crash couches that defined the hotel, stepped back to see that no light was escaping from its dim display, and then trotted back to Alberto through the darkness, afraid to be caught away from my customary place.

The sudden harsh light of morning found Quintana sitting with his back against a wall, eyes blackened and swollen closed, nose and lips bloodied, and Fong organizing a search. I was among her first targets, and Alberto shortly after me. Brown opened a new round of shouts and accusations, and

Fong had to set two of her people to prevent him from assaulting Quintana further. It occurred to me that Brown was making Quintana's argument more effectively than Quintana had.

The sense of Brown's status as our savior and best hope of freedom tarnished quickly in the next hours. I felt the confidence the others had in him faltering like the pressure of a coming storm. If they turned on him, unleashed the years of frustration and anxiety and despair upon his fragile human body, I didn't think the guards would be able to reach him in time. It was an interesting possibility, but also a warning should I manage to put myself in his place.

As soon as it seemed plausible, I took Alberto by the hand and drew him toward the hotel. Hardberger and Navarro were going through the crash couches near it, and I was anxious that they would find our golden apple before I had a chance to taste it. I thought Navarro scowled at me as I made my way toward privacy and the hiding place, but it might only have been my imagination. Once we were in the hotel and visually cut off, I retrieved the hand terminal.

Now, with light and proximity, I could actually see it: blue-gray casing with an extended keyboard for full scientific notations; a scratch along the right side of the screen that caught and refracted the light of the display, rainbows out of the yellow default image; a logo of the Mars Congressional Republic Navy stamped into the casing and echoed on the screen. I stroked it with my fingertips, feeling serene and untouchable. If church had felt half as good as this, I would have been a religious man.

With a sense of nearly superhuman calm, I opened the data files. Charts and reading appeared before me.

It was the experiment. *My* experiment. Only it also was not. The basic structures were there: the peculiar way the individual molecular engines unfolded; the instantaneous networking that suggested entanglement communication; the beautifully complicated tertiary beta sheeting studded with proteins dense with information and vulnerable to oxidation. I had the sudden, powerful memory of being in the lab on Phoebe seeing the nanoparticles express those sheets for the first time. Krantz had described it as *snowflake castles looking for the nearest blowtorch*.

They were still beautiful, still fragile, but they had defied the blowtorch. They had found ways to express themselves, creating what appeared to be massive constructions implied first in their microscopic structure, like an infinite cascade of fractal design. There were maps of control points that were clearly cellular machinery that had been hijacked and modified, complex layers of pattern-matching mechanisms that stank of human neocortical structures, and something... else.

I was looking at the oak and recognizing the acorn.

I spooled through the information as quickly as I could, taking in the first and last paragraphs of the reports, glancing at the diagrams and data just long enough to take a general sense of them and then moving on. The navigation keys of the hand terminal clicked as I pressed them, like I was crushing tiny beetles. There was clearly a deeper structure that the development of the beta sheets was protecting and promoting. I didn't begin to understand the energetic dynamics of it, but there was, I thought, a privileged group. Something about the logic of the individual particles reminded me of a paper I'd read in Tel Aviv that reexamined sperm. The thesis was that rather than a homogeneous collection of equally competing cells, there were classes of sperm; subspecies that acted as a team to present a chosen cell or class of cells to the ovum.

Alberto said my name, and I was aware of it the way I might have been aware of a candle flame in the noonday sun. It was there, but it had very little impact.

The privileged group could probably be identified by its place within the logical structure of the network, but something about that felt wrong. I paged back through the diagrams. I had the sense there was an asymmetry in the network someplace that I could almost—not quite, but almost—place. It was analogous to something I already knew about, but I didn't know what. I growled and went back to the start. Alberto said my name again, and I looked up too late.

Fong stood over us both, her expression carved from hardwood. I felt a flash of resentment at her interruption and swallowed it quickly. I held out the hand terminal.

"Look what I found," I said.

She took it from me and paused. I could see the desire to punish me in her mouth and the angle of her shoulders. Alberto squirmed beside me and Navarro appeared at Fong's side. I heard Brown yawp with delight. He'd caught sight of his lost treasure. I anticipated Quintana's anger and disappointment, but it didn't matter to me. My goal had never been to help him.

"Quintana's an asshole, but he isn't wrong. He won't solve it," I said, and Fong shook her head as if to say *I don't know what you're talking about*. I smiled tightly. "Brown won't solve it. He won't give them what they're looking for. We may not get another chance."

"That's not how this works," she said.

"I can help," I said. "Tell him to let me help." For a moment, it seemed as if she might reply, but instead she turned away without pressing the issue.

It felt like a victory.

• • • • •

My advisor at Tel Aviv—David Artemis Kuhn—had a beautiful name, a way of wearing a formal jacket just messily enough to say he was in on the joke, and a voice that sounded like the first sip of rum feels: sharp and warm and relaxing. His office smelled of coffee and freshly turned soil. I admired him, I crushed on him, I aspired to be him. If he had told me to quit the university and write poetry, I probably would have.

"Nanoinformatics is perfect for you," he said. "It's deeply interdisciplinary. You can apply it to a career in medical research or computer architecture or microecology. Of all the degree programs we have, this is the one that will keep the most doors open for you. If you're not sure what direction you want your studies to take you..." He paused and tapped his desk three times with the tip of his index finger. "This is the one."

There is nothing so destructive and also so easy to overlook as a bad idea.

A thought experiment from my first course in the program: Take a bar of metal and put a single notch in it. The two lengths thus defined have a

relationship that can be expressed as the ratio between them. In theory, therefore, any rational number can be expressed with a single mark on a bar of metal. Using a simple alphabetic code, a mark that calculated to a ratio of .1215225 could be read as 12-15-22-5, or “l-o-v-e.” The complete plays of Shakespeare could be written in a single mark, if it were possible to measure accurately enough. Or the machine language expression of the most advanced expert systems, though by then the notch might be small enough that Planck’s constant got in the way. How massive amounts of information could be expressed in and retrieved from infinitesimal objects was the driving concern of my college years. I swam in an intellectual sea of qubits and data implication, coding structures and Rényi entropy.

I spent days in the computation labs with their leather couches and ancient ceramic lockers, talking with people from all across the world and beyond. The first Belter I met was a woman from the L5 station who had come down to study crystallography, though since she lived in the consistent spin gravity of that station, she looked more like a Martian than the elongated soldiers who would eventually become my guards. My nights I divided between my dorm room and the bright bars and sober coffeehouses along the edge of the campus.

Slowly, I began to take the sad, traumatized boy who had fled Londrina and a life on basic and build from him a deeper, more serious, more focused man. I styled myself a scientist and wore the thin black vests and sand-colored silk shirts that the biology students had adopted as their fashion. I even joined the student union for scientific outreach, sitting through the long, angry, clove-cigarette-hazed meetings and arguing when people from the more traditional programs complained that my work was closer to philosophy than engineering.

I drank a bit of wine, I smoked a little marijuana, but the drugs that fueled the university were not recreational. Tel Aviv Autonomous University ran on nootropics: nicotine, caffeine, amphetamine, dextroamphetamine, methylphenidate, 2-oxo-pyrrolidine acetamide. Aaron, my roommate, provided both a route for these to reach me and the worldview that justified them.

“We’re the bottom,” he said, leaning on the arm of our cheap foam-sculpt couch. “You and me and everyone else in this place. If we weren’t, we’d have gone to a real school.”

“We’re at a real school. We’re doing good work here,” I said. We were eating noodles and black sauce that they sold from a cart that passed down the halls of the dorm house, and the smell of something like olives rose from every mouthful.

“Exactly,” Aaron said, stabbing a fork in my direction. “We are keeping up with the most advanced, best-funded schools anywhere. Us, a bunch of basic jump-ups. Our mommies aren’t giving multimillion-dollar grants to the school. We aren’t skating on discoveries made by some department chair seventy years ago. Do you think they have a nanoinformatics program at the École?”

“Yes,” I said, feeling contrary.

“They don’t. We do. Because we *have* to be on the cutting edge to survive. We don’t have status, we don’t have money, we don’t have any of the things you need to get a foot in the door with recruiters or unions or grant specialists. So we make our own.” With this he took a thin case from his pocket and rattled it. “What the others can’t, or won’t, or don’t feel like they need to do is just necessary for us.”

Deep in my chest, a sluggish sense of fairness twitched in its sleep, but I could find no argument against, especially since it seemed as though everyone else in the program agreed. What would make it unfair, I told myself, was if the drugs tilted the playing field. If everyone was using them, then it stayed even.

As my career at the university went on and I came nearer to the knife-edge horizon of graduating, I found myself caring less and less about the fairness of the situation and more and more about my own well-being. Since nanoinformatics was a new program it didn’t have its own permanent faculty. Half of the classes on its requirements list were borrowed from other programs, and the professors often hadn’t tailored the content to include me. In my culmination-level seminar, all of the other half-dozen students were strict biologists working from a shared curriculum that I had

only brushed against. Taking focus drugs in that context seemed like the obvious thing.

In my last year, both Aaron and David Artemis Kuhn left. Aaron graduated early with a job offer for a cutting-edge R&D group so deep, even its name was under nondisclosure. Kuhn left to take a tenure-track position at Nankai University on Luna, heading up their nascent nanoinformatics program. I acquired other friends and professors in my time at Tel Aviv, but I found the absence of those two particularly unmooring, and my use of drugs ramped slowly up. I came to include sedatives in my study rituals, telling myself that they helped me rest and recharge. That I enjoyed the sense of release and mindlessness they brought, I chose to interpret as the measure of the stress I was under.

My graduation ceremony took place in a synagogue with white pillars and arches, beautiful sculpture in gold along the walls, and Hebrew script inlaid around the ceiling. The notes of “Auld Lang Syne” reverberated in the space, the melody taking on a depth and gravity I had never ascribed to it. My body, struggling from the massive nootropic abuse surrounding final examinations compounded by several whisky-and-sodas, punished me with nausea and dizziness. I spent my glorious hour, the pinnacle of my new life, trying not to vomit. I didn’t know whether to imagine my mother’s spirit viewing me from the afterlife with pride or despair. Afterward, diploma in hand, robes draped from my shoulders, I walked to a public park, sat on a stone bench, and wept, calling my mother’s name with an oceanic grief I had avoided for years.

It would be difficult to say which sign of trouble deserved the title “first.” When I visited my placement advisor after graduation, I spent an hour explaining to her what my degree entailed and applied to. It left her only slightly better prepared to help me find work. Letters began to arrive—actual physical letters on thin, yellow paper—from the benefits administration office asking whether I would be returning to the basic rolls. My applications to Stravos Group, Beyaz/Siyah, and Unfinished History all brought acknowledgments of receipt, and then nothing.

I laughed it all off for three months. I told myself and my friends that the cutting edge always confused the people who weren’t part of it. My

advisor's job wasn't to understand me, just to make connections. If she couldn't, other paths existed. I played it as more an inconvenience than a problem, and the prospect of going back on basic as laughable. I had a degree from a recognized university. I had letters of recommendation. The cheap housing, gray-tasting food, recycled clothing, and minimalist medical care of basic marked where I came from, not where I was going. The applications took longer than I'd expected, but I could be patient. I still had six months of supported postgraduate housing, until I had three, and then seven weeks, and then twelve days.

When I could no longer ignore that I would be out of housing allowance before I found employment, my friends had for the most part scattered to new positions of their own. The sense of isolation pressed at the back of my head all through the days and nights. I began growing angry at the slightest provocation.

In practice, the course of study meant to give me the most options had instead left me as the fourth-rank pick for everything behind people who had specialized. And even that was not the worst of my problems. I assumed that after my last exams, my use of nootropics and sedatives would end more or less of its own accord. The need, after all, evaporated. If now and then I used a tab to help me navigate the surprising complexities of my postgraduation world, others did as much with no stigma or ill effect. Without the drugs, my merely normal cognition felt sluggish and unfocused. And the sedatives were only to make my sleep deeper, more restful, more productive.

The penny dropped for me at a café on Yigal Alon Street where I sat under a copper awning with my hand terminal cradled in my palms. Over a cup of tea and a bit of scone, I reviewed my expenses with an eye toward how I could extend my job search without going on basic. The first-pass numbers felt like a kick in the gut. When I redid the math, I found the same thing. In the months since completing my program, my drug use had gone *up*.

I don't know how long I sat there, the waiter coming by now and again to touch my shoulder and ask if I was well. I remember very clearly that there were two young women at the table beside me planning a wedding

while I came to grips with the truths I had denied. I'd exchanged Londrina and life on basic for a degree I couldn't use and a rainbow of addictions. I was, if anything, worse off now than when I had spent my days watching my mother fade into death.

I can't say why at that point I didn't fall into despair. Despair was certainly open to me. In practice, I did not. Instead, I made what I called my rescue plan: a list of fifty work positions that, while they fit poorly with my education and ambitions, would suffice to keep me off basic; a consolidated account with what little actual money remained to me; a month's supply of fruit and whole grain foods; a hotel room where I could sleep and pace and weep while I withdrew. I put in my fifty applications all at once, checked in to my exclusive and unlicensed treatment center overlooking an alleyway, and prepared myself for hell.

I did not sleep for the first week. My body ached like I'd been beaten. My eyes dried until my vision grew blurry. I watched my emotions cycle up and down and up again, the wavelength of my illness growing shorter and shorter until I could no longer tell where in the cycle I was. The cravings were like hunger or thirst or overwhelming lust, and I only postponed acting on them by promising myself that if I still wanted so badly when I was done, I would indulge myself to death. I anticipated my eventual overdose like a zealot looking forward to Armageddon.

I have no clear memory of the second week. When I came to myself again in the middle of the third week—ten days still remaining on my rented room—I felt weak and hungry and clear headed in a way I had not realized until then how much I missed. My mind was my own. I could not help but think of my mother and the way her disease blinded her to its own symptoms. I understood her better then. My own addiction functioned in a similar way. In the exhaustion of my recovery, I dreamed of finding doors that had been plastered over that opened to rooms I'd had once and forgotten about, filled with books and scientific instruments that I needed and had been unable to locate. The metaphor wasn't subtle. I swore that I would never compromise my mind that way again, though like all such resolutions, I have since broken it profoundly.

With seven days remaining, I bathed, shaved, and took myself out for a meal of eggs and coffee I could barely afford. My time in the underworld nearly over—so I thought—I had to prepare for my return to the world of the living. If there was nothing waiting for me, that meant turning myself over to benefits administration. I cannot express how terrible that option seemed to me, but I was willing to face it, should it prove necessary. I thought I had moved beyond illusions about myself and what I was capable of enduring. That might even have been true. Remembering what I felt then and feeling it again now are very different things, and one is easier than the other.

I had five messages waiting. Four were from the applications I had sent out, two asking for more information about my qualifications, two scheduling interviews. The last, to my surprise, was Aaron returning to my life. His research-and-development gig had come across something that justified bumping up the budget. There were new positions opening up, including a full nanoinformatics team. Later, I would wonder if I saw the changes in him even then. A recording on a terminal can't carry the same weight of nuance as an actual conversation and sociopathy often approaches undetectability, even under the best of circumstances. I hope that I genuinely missed it. If I saw it and chose to edit it out of my perceptions, if the leaping hope in my breast was more important to me than the new-won integrity of my mind, it speaks poorly of me. I would rather be damned as naïve than willfully ignorant.

I responded at once: I would be delighted to talk about work. I told him that, just between the two of us, I'd been in a dry spell, and was even beginning to think that David Artemis Kuhn had led me astray with his professorial charisma and beautiful name. I made a joke of my season in hell, telling him but also not telling him, afraid of what he would think of me. At the time I gave more weight to the opinions of others.

Aaron's response came quickly. He'd spoken to the powers that be, and the project lead wanted to speak with me. He would be reaching out in the next few days. His name, so I could expect it, was Antony Dresden.

The others, even Alberto, didn't really understand what it meant to be research. I do believe that's true. On Thoth Station, we were treated as different—as dangerous—which we were. But their sense of our monstrosity was misplaced. The changes that we went through to become what we became didn't blind us to humanity. Our emotional lives didn't stop. All of us in research suffered the same loves and hopes and jealousies that administration and maintenance and security did. If someone felt flattered or excluded or tired, we saw it just as anyone else might. The difference, and I think it was the only difference, came from not caring anymore.

The confusion rose from metaphors of mental illness. The others thought of research as a collection of borderline autistics, and while there were several who did participate on that spectrum—Owsley in chemical signaling, Arbrecht in modeling—they were not created. They brought their diagnoses to the table with them. The other pigeonhole, sociopathy, was nearer the truth, though I believe there were still some differences.

I remembered caring about people. My mother. Samuel, a boy two years my senior, who was my first lover. Aaron. I remembered caring deeply about whether they were well, whether they suffered, what they thought of me. I remember defining myself by the opinions of people around me. My worth had been determined from without, by how I imagined that I appeared to others. That is what being a social animal is, after all. Emotional and definitional interdependence. I remembered it like remembering that I once knew a song, but not the melody itself.

Quintana broke my nose.

It was midmorning, as we reckoned such things in the room, and Brown, his precious hand terminal clutched to his breast, had been taken away by the guards again. Alberto and I walked, making a slow circuit of the room for the simple pleasure of feeling my body in motion. I had just reached the corner farthest from the hotel when Quintana walked up to us. The benignity of his expression surprised me at first. I expected rage or

sorrow or confusion. Alberto recognized something threatening in Quintana's demeanor before I did. He shouted and tried to push me out of the way, but Quintana stepped in close, twisting his body from the waist. His elbow hit the bridge of my nose with a sound like a wine glass being stepped on: sharp and deep at the same time.

I rolled to my side, uncertain how I'd fallen down. My hands guarded my abused face but didn't touch it. Contact made the pain worse. Blood ran down my cheeks and dampened the collar of my jumpsuit. Shouting voices came at me from a great distance that turned out to be about four meters. Alberto and two of Fong's men wrestled Quintana, pushing him back and away from me. Half a dozen other prisoners ran toward us, to help keep the peace or to watch it being broken. Quintana's voice buzzed with rage so badly I couldn't understand what he was calling me or threatening me with. I rose to my knees and looked up. The Belter guards leaning on the windows above us seemed slightly less bored than usual. One, a woman with short red hair and a tattoo across her chin, smiled at me sympathetically and shrugged. I stood, but the throbbing pain brought me to my knees again.

Quintana turned away, followed by Fong herself to make certain he wouldn't circle back. The others watched them go, then Alberto came to my side.

"I told you war would come out of it."

"You're so very smart," I said, the sound of my voice like something from a child's cartoon.

He took my guarding hands and gently guided them away. "Let's survey the damage," he said. And then, "Oh, darling. You poor thing."

They stuffed my nose with two tampons donated by women in security before we reset it. Our Belter guards never made an appearance. The politics of the enormous room were our own to work through, and the Belters took no side. Still, when Brown and his escort did come, no one in the room talked about anything but the violence he'd missed.

The guards didn't allow us mirrors. The expressions of the others gave me the nearest thing to a reflection, and from that I assumed I looked pretty rough. Albert ripped the sleeve from his jumpsuit and dampened it at the

showers. My drying blood grew sticky, adhering my suit and beard to my skin and tugging at me when I moved. I sat with my back to the wall, accepting Alberto's ministrations with as much grace as I could muster. I saw Brown approach Fong, watched them speak. Brown kept shifting his weight from one foot to the other and glancing behind him, as if expecting to be Quintana's next target. I waited, still and patient, afraid that any movement on my part would scare him off. Quintana paced at the far end of the room, muttering to himself with several of Fong's security people and Mellin from imaging. Around me, the narrative of the room changed. With Quintana as the villain, I shifted to being the victim. And as the victim, approachable.

"Fong told me what happened. You look like shit," Brown said, establishing dominance before he had to admit weakness.

"I blame myself," I replied, then paused, making it a joke. "No, actually, I blame Quintana."

Alberto, approaching with a freshly dampened rag, caught sight of us, paused, and angled off to sit by himself. Brown lowered himself to sit beside me. "He's always been an asshole."

I grunted my agreement and waited. Brown shifted, fidgeted. A tightness filled my gut, and the certainty that he would offer me his sympathy and walk away filled my throat. I took hold of his arm as if I could keep him there by force, but spoke calmly. "He's been talking to you a lot?"

"They have," he said. "The Martian officer hasn't been there. It's just the Belter guards."

"What do they say?"

"They ask me what it is."

"And what do you tell them?" I asked. When he didn't respond, I tried again. "What is it?"

"It's an elaboration of the original protomolecule sample. You saw that much, didn't you? Before you gave back the terminal?"

"I did," I said. Candor about that cost me nothing.

"The thing is, they know. I'm sure of it. This isn't a problem they need to solve. It's a test. They want to see if we can solve a puzzle they've

already cracked. They don't say it, but I can hear them laughing at me."

That piqued me, but this wasn't the moment to sit with it. Brown's open shell gave me my opportunity, and I drove my knife in to keep him from closing again. "Tell them they need two. Tell them to take both of us, and I'll help."

I saw the spark of greed in his eyes, his moment of bovine cunning. Once I helped him, I would have no way to enforce any agreement, and so his betrayal of me carried no price. I fought to keep my expression innocent. My wounds and my beard helped with that, I think.

"Thank you, Cortázar," he said, and drew the hand terminal from his jumpsuit.

I took it from him gently, forcing myself not to grab at it. Under my fingertips, the files bloomed like roses, measurements and images and analytic summaries opening one after the next like diving into an ocean of data. The surface I had skimmed before lay over an abyss, and I fell joyfully into it. Some of the large-scale structures boasted an organic origin: lipid bilayers, proton pumps, something that might once have been a ribosome now altered almost past recognition. That, I believed, had led Brown astray.

He assumed that a cell membrane would be acting as a cell membrane, rather than considering what cell membranes did and how they might be used to some purpose other than simply creating a boundary between things. They could just as easily provide highways for molecules vulnerable to the partial charge of water molecules. Or any polar solvent. Like the optical illusion of faces and vases, the bilayers could define either the volumes separating them or the web of pathways they created. And these were only massive, macro-scale expressions of the information in the initial particles.

I paged through, going deeper, my mind sailing across seas of inference and assumption. Time did not stop so much as become irrelevant. I forgot that Brown was beside me until he touched my shoulder.

"It's... interesting. Let me see what I can find."

"Just understand," he said. "I'm lead."

"Of course," I said. As if I could have forgotten.

It took me longer than I would have liked, sitting with the data and dredging up what I could remember of the experiments before. Time had eaten some of my memory and likely falsified some as well. The core of it remained, though. And the sense of wonder so deep it sucked my lungs empty from time to time. But slowly, I found a pattern. The thing at the center. What I thought of as the Queen Bee. While a great many of the structures I was looking at were beyond my understanding—beyond, I thought, any human understanding—there were others that did make some sense. Lattices that mimicked the beta sheets and expanded on them. Complex control and pattern-matching systems that were still just recognizable as brain tissues, two-stage pumps adapted from hearts. And at the center, a particle that nothing led to. A particle that both required and provided a massive amount of energy.

When I realized that the physical dimensions of the structure-particle were macroscopic, the knowledge rushed through me like a flood. I was seeing a stabilizing network that could bring subquantum effects up to a classical scale. A signaling device that ignored the speed of light by shrugging off locality, or possibly a stable wormhole. If I wept, I wept quietly. No one could know what I'd found. Especially not Brown.

Not until I had time to make my alternate.

"There's no doubt we're seeing the ruins of Eros," I said.

"Obviously," he said, impatient and rightly so.

"But look at these tertiary structures," I said, pulling up the graphic I'd prepared. "The connection between networks follows the same graph as embryonic profusion."

"It's making..."

"An *egg*," I said.

Brown snatched the hand terminal from me, his eyes jerking back and forth as he compared my graphs. It was a plausible lie, backed by fascinating and evocative correlations that didn't share a shred of cause. It built on his prejudices of biological structures being used for biological uses. I watched his face as he followed along the arguments I'd constructed to mislead him. He had been desperate for a narrative, and now that I'd given him one, it seemed unlikely that he would see anything else. I don't

know whether relief or awe set his hands to trembling, only that they trembled.

“This is it,” he said. “This is what gets us out of here.”

I appreciated his use of the plural, and I didn’t for a moment consider it sincere. I clapped him on the shoulder, levered myself up, and left him to convince himself of what he already wanted to believe. The others stood scattered about the room in groups of two and three and four. Whatever they pretended, all attention focused on Brown, and because of him, on me. I reached an open space and considered the observation windows. The Belters looked down on us. On me. Their weirdly large heads, their thin, elongated bodies. Chromosomally, they were as human as I was. What separated each of us—them and me—from the rest of humanity happened at much later stages than the genetic. I caught the eye of a greasy-haired man I recognized as one who had taken Brown to and from his sessions. I lifted my arms in a kind of boast. *I know your secret. I solved your puzzle.*

Brown bonded with the wrong answer. Quintana hadn’t so much as been allowed a glimpse of the dataset. All I needed was for the Martian to ask me as well as Brown, and I would be the one they took. The prisoner they exchanged.

If something still nagged at my hindbrain—the guards hadn’t come when Quintana stole the terminal, the Martian hadn’t been there during Brown’s questioning—it had no form, and so I pushed it away. But there was a moment, that hypnagogic shift where the thoughts of the day faded into dream and the guards of rationality fell.

The poisoned thought crept in upon me then, and I went from my half doze to a cold terror in less than a heartbeat.

“It’s okay,” Alberto said. “It’s a nightmare. They’re watching him.” I looked down at him, my heart beating so violently I thought it might fail. In the shadows, Alberto rolled his eyes and turned his back to me, his head pillowed by his arm. It took me a moment to understand his assumption. He thought I feared Quintana. He was mistaken.

The filthy thought that had slipped into me was this: If the Belters were negotiating a trade of prisoners with Mars then they might well still be enemies. If they were enemies, the Belters would want to give over

whatever they had with the least intrinsic value. The Belter guards had questioned Brown twice now, without the Martian present. They might very well be probing not to see whether he had divined the secrets the data held, but to determine that he couldn't.

By trotting out my idiotic egg hypothesis, Brown might prove to our guards that he would be of the least use to their enemies. Or Quintana, by his violence and ham-handed duplicity, might convince them that Mars wouldn't be able to work with such a fragile and volatile ego.

I'd plotted my course assuming that being competent, insightful, and easy to work with would bring reward.

I astonished myself. To have come so far, through so much, and still be so naïve...

• • ● • •

"Say I'm developing a veterinary protocol for... I don't know. For horses. Should I start by trying it in pigeons?" Antony Dresden asked. He was a handsome man, and radiated charisma like a fire shedding heat. Protogen's intake facility looked more like a high-end medical clinic than an administrative office. Small, individual rooms with medical bays, autodocs, and a glass wall facing a nurses' station outside able to look in on them all, panopticon style. The company logo and motto—*First. Fastest. Furthest.*—were in green inlay on the walls.

The language in my contract mentioned a properly supervised medical performance regimen, and I assumed this had to do with that, but it still felt odd.

"I'd probably recommend trying it in horses," I said.

"Why?"

"Because that's the animal you're trying to develop a protocol for," I said, my voice turning up at the end of the sentence as if it were a question.

Dresden's smile encouraged me. "The pigeon data wouldn't tell me just as much?"

"No, sir. Pigeons and horses are very different animals. They don't work the same ways."

“I agree. So do you think animal testing is ethical?”

“Of course it is,” I said.

“Why?” The sharpness of the word unnerved me. My belly tightened and I found myself plucking at my hands.

“We need to know that drugs and treatments are safe before we start human testing,” I said. “The amount of human suffering that animal testing prevents is massive.”

“So the ends justify the means?”

“That seems a provocative way to phrase it, but yes.”

“Why not for horses?”

I shifted. The wax paper on the examination table crinkled under me. I had the sense that this was a trick, that I was in some kind of danger, but I couldn’t imagine any other answer. “I don’t understand,” I said.

“That’s okay,” Dresden said. “This is an intake conversation. Purely routine. Do you think a rat is the same as a human being?”

“I think it’s often close enough for preliminary data,” I said.

“Do you think rats are capable of suffering?”

“I think there is absolutely an ethical obligation to avoid any unnecessary suffering—”

“Not the question. Are they capable of suffering?”

I crossed my arms. “I suppose they are.”

“But their suffering doesn’t matter as much as ours,” Dresden said. “You seem uncomfortable. Did I say something to make you uncomfortable?”

At the nurses’ station, a man glanced up, catching my gaze, and then looked away. The autodoc in the wall chimed in a calm tritone. “I don’t see the point of the question, sir.”

“You will,” he said. “Don’t worry about it. We’re just getting a baseline for some things. Pupil dilation, eye movement, respiration. You’re not in any danger. Let me make a suggestion. Just see how you respond to it?”

“All right.”

“The idea that animal suffering is less important than human suffering is a religious one. It assumes a special creation, and that we—you and I—are different *in kind* than other animals. We are *morally* separate from rats or

horses or chimps, not based on any particular physical difference between us, but just because we claim that we're sacred by our nature and have dominion over them. It's a story we tell that lets us do what we do. Consider the question without that filter, and it looks very different.

"You said there's an ethical obligation to avoid unnecessary suffering. I agree. That's why getting good data is our primary responsibility. Good experimental design, deep datasets, parallel studies whenever they don't interfere. Bad data is just another way of saying needless suffering. And torturing rats to see how humans would respond? It's *terrible* data because rats aren't humans any more than pigeons are horses."

"Wait, so you're... are you saying that skipping animal testing entirely and going straight to human trials is... is *more ethical*?"

"We are the animal we're trying to build a protocol for. It's where we'd get the best data. And better data means less suffering in the long run. More *human* suffering, maybe, but less suffering *overall*. And we wouldn't have to labor under the hypocrisy of understanding evolution and also pretending there's some kind of firewall between us and other mammals. That sounds restful, don't you think?" The autodoc chimed again. Dresden looked at it and smiled. "Great. So tell me only the good things you remember about your mother." At my horrified look, he smiled and waved the comment away. "No, I'm joking. I don't need to know that."

Dresden turned to the glass wall and gestured. A young woman in a lab coat with a stethoscope around her neck like a torc came in and guided me gently back to prone. As she did Dresden leaned against the wall, casual and at ease.

"This is part of our proprietary research regimen," he said. "Performance enhancement strategies. The thing that gives us our edge."

Looking back now, I believe I felt something like fear in that moment. A sense that important decisions were being made that I was only dimly aware of. Dresden's smile and the doctor's nonchalance seemed to belie that feeling, but for a moment I almost demanded that they stop, that they let me leave.

I'm not sure if that memory is true, but fear tends to be the thing I feel and remember most acutely now, so that leads me to believe it is.

Before I could act on my fear, the doctor leaned in close to me. She smelled of lilacs. “You might feel a little odd,” she said. “Can you please count backward from twenty?”

I did, the autodoc clicking and shifting on the wall as the numbers grew smaller and smaller. At twelve I stuttered, lost myself. The doctor said something, but I couldn’t make sense of her words or find any of my own. Dresden answered her, and the ticking stopped. The doctor smiled at me. She had very kind eyes. Sometime later—a minute, an hour—language came back to me. Dresden was still there.

“The preliminary we’re doing here is magnetic. It suppresses some very specific, targeted areas of your brain. Reduces fixity. Some of our staff finds that it helps them see things they wouldn’t have otherwise.”

“It feels...”

“I know,” he said, tapping his temple. “I did it too.”

I sat up. A feeling of almost superhuman clarity washed through me. A calm like the sea after a storm smoothed my muscles. It was better than all the drugs I’d taken at the university—the focus of the nootropics, the euphoria of the sedatives. I remember thinking at the time *Ooh, this could get addictive*. Whatever fear I might have felt no longer seemed important.

“It’s nice,” I said.

“So tell me,” he said. “Is animal testing ethical? Or does it make more sense to skip to human trials?”

I blinked at him, and then I laughed. I remembered the distress I’d felt when he’d asked the same thing just minutes before, but I no longer experienced it. A clarity and calm took that space for its own, and the relief felt joyful, like I’d just heard the punch line to the best joke ever. I couldn’t stop giggling. That was the moment I became *research*. I have never regretted it.

Necessity, they say, is the mother of invention, but it is the mother of any number of other things as well: sacrifice and monstrosity and metamorphosis. Necessity is the mother of all necessary things, to coin a tautology. I gave my permission to make the change permanent that afternoon without ever dipping back into my previous cognitive states. I didn’t miss or want them. Excitement fizzed in my belly; freedom as I’d

never known it sang in my blood. A burden I hadn't known I was carrying vanished, and my mind became sharper, able to reach into places that shame or guilt or neurosis would have kept me from before. I didn't want to be what I had previously been any more than a depressive would long for despair.

And anyway, as Dresden said, we at Protogen weren't concerned with remaking the destiny of rats and pigeons.

I left Earth for the first time when I shipped to Phoebe. All I knew of the planets and dwarf planets and moons that made the habitable human system—Mars, Ceres, Pallas, Ganymede—I learned from watching the feeds. The politics of the alliance between Earth and Mars, the dangers posed by the Outer Planets Alliance and other Belter resistance groups. The story of mankind's torturous reach out into the vast emptiness of the system formed a complex story that felt as removed from my experience as the crime dramas and musical comedies that appeared on the same feeds as the news. Phoebe Station wasn't even among that number.

An obscure moon of Saturn, it began as a cometary object that found itself trapped by the gas giant's gravity as it passed by, presumably from the Kuiper Belt. It stood out from the other moons, four times as far from the planet as the next nearest. Its retrograde orbit and the lampblack darkness of its surface gave it a sense of menace. Phoebe, the ill-omened moon.

The alien weapon.

Tucked within the planetesimal's icy layers, the joint research group—Protogen and the Martian Naval Scientific Service—had found tiny reactive particles the size, roughly, of a midrange virus, but with a design structure and informational depth unlike anything Earth's biosphere had ever imagined. The protomolecule, we called it, branding it immediately in a territorial move that irritated the Martian scientists. We ignored their protests as irrelevant.

Our best guess was that it had been sent from some distance we couldn't guess at a time when a defined cell membrane stood as the heights of terrestrial life. The protomolecule appeared to be a message in a bottle, but one that included its own grammar books and instruction tutorials, ready to teach whatever aboriginal cells it found how to become the things it

required. We argued whether something as inert as a spore might be intelligent, at least implicitly, but without coming to a conclusion. The first evidence of a tree of life apart from our own enchanted and confounded us. Me.

The base itself showed its military origins in its bones. The corridors, hardened to shield us all from the void's vicious background radiation, were in the colors of the Martian navy. Each hallway bore the identification marks that told installation order, structural specifications, location within the base, and the date on which it needed replacement. The walls sported the same anti-spalling coatings as the ships. The food in the mess tasted of Mars: hot chile peppers, hydroponic fruit, ramen noodles in vacuum-sealed pouches, daily low-g pharmaceuticals. We had no extra space. The rooms I'd had on basic were larger than the cells I lived in there: a rack of bunks four high with a shared head so small that I braced my knees against the opposite wall every time I used the toilet. Of my eighty-five kilograms, I felt a little over three. Exercise took almost a third of the day, the lab a third, eating and sleeping and showering in the tight steel-and-ceramic shower a third.

The Protogen nanoinformatics team there claimed only four seats: Trinh, Quintana, Le, and myself. Mars had a matching number who joined us. The others would join in later, when we shifted to Thoth Station, though by then the Martian contingent would no longer be in play. The rest of the research team wasn't more than fifty, all told. With our counterparts from Mars and the naval support staff, Phoebe Base was a few hundred people on a black snowball so far from Earth that the sun would have been no more than the brightest star if we had ever looked for it.

If I chose a time in my life to return to, a high-water mark, those months on Phoebe would be it. The protomolecule astounded me every day. The depth of information in it, the elegance of its utterly minimal quasi-flagella, the eerie way it self-organized. One day I would convince myself that we were looking at something like a hive of termites, the next a colony of mold spores, the next neurons in a weird distributed brain. I struggled to find analogies, to make what I saw in the scanners fit into what I already knew. Every night, I slipped into my bunk, strapping myself down with wide

padded straps to keep from throwing myself out with an unintentional twitch, and thought of what I'd seen and heard, what tricks the protomolecule had performed that day. We were all of us in research quivering with the sense of being just a moment from revelation.

When the news came from Dresden's office of the second- and third-phase plans, I felt like the universe had leaned down and kissed my cheek. The opportunity to see what the protomolecule chose to do with large-scale structures was the best thing I could have imagined. The prospect filled me to the point of spilling over, and then filled me some more.

We killed the Martians in the middle of my work shift. It had all been plotted out, of course. Planned in back channels where our partners wouldn't hear us. When the moment came, I left my desk, moving toward the head, but paused to key in the override sequence. The Martians didn't notice anything. Not right away. And by the time they did, it was too late. We infected them and trapped them in a sealed level 4 containment lab. Watching the initial infection stages work on humans set the course for everything that would come later, but we couldn't afford to let the transformation fully run its course in a location we didn't control. So once we had our early-stage data, we gassed them and then burned the bodies.

When the *Anubis* arrived to retrieve the team and our precious samples, I walked to the dock with an odd wistfulness but also with a sense of anticipation. On the one hand, I'd loved my time there, and I would never again walk through these corridors. On the other, the experiment rising on my personal horizon promised to crack open everything we understood about the universe. I anticipated seeing the fascinating little particles arrange themselves, expressing layers of implicit information like a lotus eternally blooming.

When the ship left, the plume of our fusion drive finished sterilizing the base. The dataset we took from the infected Martians, while interesting and evocative, suffered from a relatively small absolute biomass. Phoebe base was smaller than a city elementary school, and our analyses strongly suggested that the protomolecule went through behavioral phase changes with increased mass as profound as a switch between states of matter.

In the ship burning toward Thoth Station, the team sat in the galley, putting up models to show how the men and women we'd recently shared meals and sometimes bunks with had been infected, disassembled, and repurposed into larger-scale tools to express the protomolecule's same underlying information structure. Trinh maintained that her data scheme outperformed Quintana's and she did so with a ferocity that ended with her stabbing a fork into his thigh and being confined to quarters. There were also rumors of assaults among the other research groups, the natural expression, I thought, of the excitement and stress we had all been under. I was almost certainly projecting, but I couldn't help comparing us to our subject. All of us in research had become exotics, and with time and changing environments, we—like it—would reassemble and reconfigure and become something unpredictable and possibly glorious.

We had almost reached the flip-and-burn at the middle of our transit when it occurred to me that the vast sorrow I had carried with me since the day my mother dropped the glass was gone. I could think of her now without weeping, without wanting to bury myself in activity or anesthetize myself with drugs. I didn't know if it was because I had finished the natural progression of grief, or if the process of becoming *research* had burned the ability to feel that guilt and horror out of me.

Either way, it was a good sign.

• • ● • •

I didn't sleep again that night, though occasional slips of dream assaulted me when I slipped into a light doze. In these I searched an empty room for something precious I knew belonged there. In the periods when full wakefulness pinched me, I wrestled with strategies and second guesses. The prohibition against changing a first answer served me well in university, as it had generations of students before. Now and here, the certainty that change offered me my only hope seemed obvious and suspect and obvious again, switching valence sometimes with every breath. The urge to run to Brown and destroy the arguments I'd made before, show him the real truth behind the data on his hand terminal, warred with the fear that doing so

condemned me to life and death in the room. I remembered old comedy routines about intellectuals overthinking problems: I know, but he knows I know, but I know he knows I know, and on and on until subtlety iterated itself into the absurd.

Brown suffered none of it. All that morning he walked through the room, smiling and nodding to our fellow prisoners. Quintana sulked in a far corner of the room, sitting by himself and glowering across the emptiness at us. He stayed too far away for me to make out his features, but I imagined him in a permanent scowl. Alberto tried to engage me in conversation, concerned, I think, by my sullenness.

When the doors opened and the guards appeared carrying our morning meals of textured yeast protein in the spun-starch boxes that we ate as dessert, a spike of cold horror split me, and I came to my decision. Brown trotted toward them, beaming. I ran across to him, waving my arms to catch his attention, and coincidentally the guards' and Fong's as well. That my action aided Quintana's plan only became clear later. It wasn't my intention.

"I was wrong," I said plucking Brown's sleeve like a child imploring his father. "It came to me last night. I was wrong."

"No, you weren't," Brown said, his tone impatient. "I went over all of it."

"Not all. There's more. I know more. I can *show* you."

A tall woman with hundreds of tiny black moles dotting her face led the guards. I knew her as I knew all the Belter guards: as a force of nature imposed on us. Still, I'd seen her enough for the familiarity of her face to let me read the curiosity in her. I plucked Brown's sleeve more anxiously, trying to draw him away, out of her earshot. The conviction that the Belters would give the Martian the worst, not the best, of research seemed self-evident now. I feared letting her hear me say something that might suggest I knew the truth. Brown didn't move, so I leaned in closer to him.

"It's not an egg," I hissed. "It's the support frame for a stable nonlocality. Something to pass information. Maybe even mass. It only looks biological because it co-opted biological material."

For the first time, I saw doubt flicker in Brown's eyes. I hoped that truth would be enough to sway his certainty. "Bullshit," he said. I'd done my

work too well.

“Do an implicit structure analysis,” I said. “Look at the membranes as pathways, not walls. See how the resonances reinforce. The protomolecule *opened* something. It’s not an alien, it’s a way for the aliens to talk to us. Or to *get* here. Don’t trust me. Look at the *data*.”

Brown looked deeply into my eyes, as if he could measure my sincerity from my pupils. A voice behind us rose in a weirdly strangled cry, and I turned toward it.

That is the last clear memory I have for a time.

I had never been stabbed before. It wasn’t at all what I would have guessed. My recollection is of a sudden impact driving me up and off my feet. Very loud shouting, very far away as multiple voices barked conflicted orders, though to whom I couldn’t say. The unmistakable and assaulting noise of gunfire. Lying on the deck, looking up at the empty row of observation windows, convinced that I’d been hit or kicked hard enough to break one of my ribs, then putting my hand to my side and finding it bloody and reaching the conclusion that, no, I’d been shot. Quintana, four meters away, his head and chest mutilated by bullets. I have a vivid image of Fong standing over his body with a pistol in her hand, but I’m almost certain of that memory’s falsehood. I can’t imagine the Belter guards suffering us to be armed, even if we shared a common enemy.

Other shards of my memory of the attack, though more plausible, have nothing I can attach them to. Alberto with his hands in bloody fists. The Belter guards pressing their bodies over mine, to protect me or subdue me or stanch the bleeding. The smell of gun smoke. The gritty feel of the floor against my cheek and hands. Perhaps normal people take these things and weave them into a coherent narrative, like making sense of a particularly surreal dream. For me, they simply exist. The prospect of a discontinuous cognitive life holds no terror for me, or, I suspect, for anyone in research.

Afterward, I heard the story told: Quintana’s battle cry, his rush toward us. According to Navarro, he pushed Brown out of the way in order to reach me. The Belter guards shot Quintana to death, and afterward the mole-speckled woman stood over his body cursing in the incomprehensible argot of her people and shouting into her radio. Brown, they rushed away, out the

door and into whatever rooms they used to protect and isolate him from us. The medical team that treated me arrived quickly, but didn't evacuate me. I lay first on the floor and then one of the crash couches. Quintana's improvised knife, a length of steel pried from the base of a couch, inserted just below my ribs on the right, angling up toward my liver. A few more centimeters and my chances of survival would have fallen drastically, but they didn't. I found it difficult to focus on things that might have happened, knowing as I did that they hadn't. But that came later.

At first I slept in a narcotic cloud like a physical memory of university. When I woke, Alberto lay curled beside me, his body feeling oddly cold, though in fact it was my fever that made it seem that way. For two more days, I rested and slept, Belter medics coming both with and between meals to switch out supply packs on the autodoc they had strapped to my arm. When I asked them where Brown was, what was happening with him, they answered with evasions or pretended I hadn't spoken. The only information I gleaned in those terrible days was once, when I demanded to know, weeping, if he'd gone, and one of the medics twitched her head in an almost subliminal *no*. I told myself she'd meant that he was still on the station rather than the equally plausible negatives that she didn't know or she wouldn't answer or I shouldn't ask. Hope survives even stretched to a single molecule's thickness.

The room spoke of nothing but the attack during all the time Brown remained absent, even—perhaps especially—when they spoke of something else. Just before lights-out, Ma and Coombs fought, shouting at each other for the better part of an hour over whether Ma had taken too long a shower. Bhalki, who usually kept to herself, approached Enz, talking tearfully for hours on end, and wound up in the hotel with loud and unpleasant-sounding intercourse. Navarro and Fong put together patrols that, in a population now under three dozen, felt both ridiculous and threatening. All of it was about the attack, though I didn't understand the complexity of it until Alberto held forth on the subject.

"Grief makes people crazy," he said. We were sharing a container of white kibble that looked like malformed rice and tasted like the unholy offspring of a chicken and a mushroom.

“*Grief?*” I must have sounded outraged at the thought, and in fairness, I was a little. Alberto rolled his eyes and waved the heat of my reply away.

“Not for Quintana. Not for the man, anyway. It’s the *idea* of him. We were thirty-five people. Now we’re thirty-four. Sure, the one we lost was an asshole. That’s not the point. It was the same for Kanter. Every time one of us dies, it will be the same. We are all less in ourselves because we’re less together. They aren’t mourning him. They’re mourning themselves and all the lives they could have had if we weren’t stuck in here. Quintana’s just a reminder of that.”

“For whom the bell tolls? Well, that’s a thought. Thirty-six,” I said, and Alberto frowned at me. “You said we were thirty-five down to thirty-four, but there were thirty-six of us.”

“No one counts Brown anymore,” Alberto said. He took a mouthful of kibble using his index and middle fingers as a spoon, then sucked the food between his cheek and his teeth, pulling out the broth before swallowing the greasy remnant. It was the best way to eat Belter kibble. “They would be mourning you, if you’d gone,” he said, and turned to me. There were tears in his eyes. “I would be.”

I didn’t know if he meant gone the way they assumed Brown to be already apart from the group, or dead like Quintana, but I didn’t ask for clarification. Perhaps leaving the room by dying out of it or being traded to the Martian were interchangeable for the people left behind. I guessed that was Alberto’s point.

We put the rest of the kibble aside and lay together, his weight on my left to keep the wound in my side from hurting. Between my own discomfort, the uncertainty over Brown’s status, and—unaccountably to me—Van Ark and Fong weeping loudly through the night, I slept poorly. And in the morning, Brown came back.

When the lights came on and the doors opened, he walked in with the guards. The time he’d spent sequestered had changed him. The others crowded around him, but he extricated himself from them and came to me. The brightness in his eyes reminded me of our best days on Phoebe and Thoth Station. I stood as he approached, and he grabbed my shoulder, pulling me away where the guards and the others couldn’t hear us.

“You’re *right*,” he said. “It took me three days to find the fucker, but you’re *right*.”

“Did you tell them?”

“I did,” he said. “They confirmed. When I get out, I swear to God, I will —”

The shout of the Belter guard interrupted us. The large, gray-haired man led the group today, and he strode toward us with his assault rifle drawn. “Genug la tué! No talking, sabé?”

Brown turned toward the guard. “This is the other nanoinformatics. I need to—” The guard pushed him aside with a gentleness more dismissive than violence.

“You come you,” the guard said to me, gesturing with the barrel of his gun. My heart bloomed; my blood turned to light and poured out through the capillaries in my eyes and mouth. I became a thing of fire and brightness. Or that was how it felt.

“Me?” I said, but the guards didn’t speak again, only formed a square around me and ushered me away. I looked over my shoulder as the doors closed behind me to see Brown and Alberto standing together watching me in slack-jawed astonishment. Mourning, I supposed, the lives they could have had. The doors closed on them. Or else on me.

The guards didn’t talk to me and I didn’t engage with them as they led me through the station corridors. The chamber they delivered me to boasted a laminate bamboo table, four cushioned chairs, and a carafe of what appeared to be iced tea. At the gray man’s nod, I took a seat. A few minutes later a woman came in. From the darkness of her hair and the shape of her eyes, I knew her family had been East Asian once. From her body and the slightly enlarged head, I knew they were Belters now.

“Dr. Cortázar,” she said. Unlike the others, her accent was as soft as a broadcast feed’s talking head. “I’m sorry we haven’t spoken before. My name is Michio Pa.”

“Pa,” I said, assuming from her military bearing that she was not a first-name sort. Her slight smile suggested I’d guessed correctly. The gray man said something in Belter polyglot too fast for me to follow and Pa nodded.

“Am I correct that you’ve had an opportunity to review the same data as Dr. Brown?”

I folded my hands in my lap, squeezing my knuckles until they hurt. “He let me look at it, yes.”

“Were you able to draw any conclusions?”

“I was,” I said.

Pa poured out glasses of tea for the both of us and then pulled up a virtual display. I recognized the data structures as I would have a lover’s face. “What do you make of it?”

I felt the trembling as if it rose up from the station itself, and not my own body. I drew in a shuddering breath. “Based on the profusion rate data and the internal structures, I believe the latent information within the protomolecule is expressing something similar in function to an egg.”

Her smile pitied me. “Walk me through that.”

I did, recounting for her all that I’d already said to Brown, back when I’d meant to make him out the fool. I wore my invisible jester’s cap well; I capered and grew excited. By the end, I managed to half-convince myself that everything I said was possible. That the gate—I never called it that—might *also* be an egg. The most effective lies, after all, convince the liar.

When I finished, she nodded. “Thank you.”

“You can’t give them Brown,” I said. “He did liaison duty. The real work belonged to us. Send me instead.”

“We’re considering how to go forward.” She rose, and I moved to her, taking her hand.

“If you put me in the room again, he’ll kill me.”

She paused. “Why do you say that?”

“He’s from the research group.”

“So are you.”

It took me long seconds to put words to something so obvious. “It’s what I would do.”

After the squalor and close quarters of Phoebe, the spacious, well-lit corridors of Thoth Station felt like distilled luxury. Wide, white halls that curved with a near-organic grace. Team workspaces and individual carrels both. I slept in a private room no larger than a medieval monk's cell, but I shared it with no one. I ate cultured steak as tender and rich as the best that Earth had to offer and drank wine indistinguishable from the real thing. The local climate, free from the temperature inertia carried by Phoebe's eight quadrillion tons of ice, remained balmy and pleasant.

Thoth boasted a research staff larger and better qualified than the universities on Earth or Luna, and the equal of even the best on Mars. The nanoinformatics team grew larger than before, even counting the loss of our Martian naval colleagues. Instead of only Trinh and Le and Quintana, I could now talk through my ideas about the protomolecule with a professional musician turned information engineer named Bouthers and an ancient-looking woman named Althea Ecco, who I didn't realize for almost a week authored half of my textbooks from Tel Aviv. And Lodge, and Kenzi, and Yacobsen, and Al-Farmi, and Brown. We sat up nights in the common rooms, mixing now and then with the other groups: biochemistry, signaling theory, morphology, physical engineering, chemical engineering, logical engineering, and on and on until it seemed like Thoth represented every specialty that cutting-edge research could invent. Like the coffeehouses of Muslim Spain, we created civilization among ourselves. Or at least it felt that way. It might only have been the romance of the times.

Everyone in research had undergone the treatment, which admittedly posed some problems. Singh in computational biology held forth on her theory of the protomolecule as a Guzman-style quantum computer one night over dinner, and when Kibushi used the information without citing her, she snuck into the showers at the gymnasium and beat him to death with a ceramic workbench cap. After that, security kept a closer eye on us all, but they also switched to nonlethal weapons. Singh, while formally reprimanded by Dresden, kept her status on her team. It only tended to confirm what we all already knew: Morality as we had known it no longer applied to us. We had become too important for consequences.

We prepared then and we waited, the tension of every day growing more refined and exquisite. Rumors swirled of the sample going awry and being recovered, of information ops plans put in place to distract any possible regulatory bodies from our work until they also understood the transcendent importance of what we would have accomplished, of our sister research stations on Io and Osiris Station and the smaller projects they were engaged with. None of it mattered. Even the greatest war in human history would have been paltry compared with our work. To bend the protomolecule to our own will, to direct the flow of information now as whatever alien brilliance had done before, opened the concept of humanity beyond anything that even we were capable of imagining. If we managed what we hoped, the sacrifice of Eros Station would unlock literally anything we could imagine.

The prospect of the protomolecule's designers arriving to find humans unprepared for their invasion gave us—or me at any rate—that extra chill of fear. I had no compunctions, no sense of regret. I'd had it burned out of me. But I believe that even if I'd refused the procedure, I would have done precisely as I did. I'm smart enough to know that this is almost certainly not true, but I believe it.

The word came nearly at the end of shift one day: Eros would be online in seventeen hours.

No one slept that night. No one even tried. I ate dinner—chicken fesejan and jeweled rice—with Trinh and Lodge, the three of us leaning over the tall, slightly wobbly table and talking fast, as if we could will time to pass more quickly. On other nights we would have gone back to our rooms, let ourselves be locked in by security, watched whatever entertainments the heavily censored company feeds provided. That night we went back to the labs and worked a full second shift. We checked all our connection arrays, ran sample sets, prepared. When the data came in, it would be as a broadcast, available everywhere. We only had to listen, and so tracking us through that signal became impossible. The price of this anonymity was high. There would be no rerunning a missed sample, no second chances. The equipment on Eros—both the most important and the most vulnerable—lay beyond our control, so we obsessed over what we could reach.

My station, and the center of my being, had a wall-size screen, a multiple-valence interface, and the most comfortable chair I have ever had. The water tasted of cucumber, citrus, and oxiracetam. The stations for Le, Lodge, and Quintana shared my space, the four of us facing away from each other in a floor plan like the petals of a very simple flower. Eros had a million and a half people in an enclosed environment, seven thousand weather-station-style data collection centers in the public corridors, and Protogen-coded software updates on all the asteroid station's environmental controls, including the air and water recycling systems. Each of us waited for the data to come, hungry for the cells in our databases to begin filling, the patterns we felt certain would be there to emerge.

Every minute lasted two. My sleep-deprived body seemed to vibrate in my chair, as if my blood had found the perfect resonance frequency for the room and would slowly tear it apart. Le sighed and coughed and sighed again until the only things that kept me from attacking her out of raw annoyance were the security guard outside our door and the certainty it would mean missing the beginning of our data stream.

Quintana cheered first, and then Le, and then all of us together, howling with joy that felt sweeter for being so long delayed. The data poured in, filling the cells of our analytic spreadsheets and databases. For those first beautiful hours, I traced the changes on a physical map of Eros Station. The protomolecule activity began at the shelters that we'd converted to incubators, feeding the smart particles with the radiation that seemed to best drive activity. It spread along the transit tunnels, out to the casino levels, the maintenance tunnels, the docks. It eddied through the caves of Eros like a vast breath, the greatest act of transformation in the history of the human race and the tree of life from which it sprang, and I—along with a handful of others—watched it unfold in an awe that approached religious ecstasy.

I want to say that I honored the sacrificed population, that I took a moment in my heart to thank them for the contribution they were all unwittingly making for the future that they left behind. The sort of thing you're trained to say about any lab animals advanced enough to be cute. And maybe I did, but my fascination with the protomolecule and its magic

—that isn't too strong a word—overwhelmed any sentimentality I had about our methods.

How long did it take before we understood how badly we'd underestimated the task? In my memory, it is almost instantaneous, but I know that isn't true. Certainly for the first day, two days, three, we must have withheld judgment. So little time afforded us—meaning me—only a very narrow slice of the overall dataset. But too soon, the complexity on Eros outstripped us. The models based on examinations in the lab and the human exposure on Phoebe returned values that seesawed between incomprehensible and trivial. The protomolecule's ability to make use of high-level structures—organs, hands, brains—caught me off guard. The outward aspect of the infection skipped from being explicable in terms of simple cause-and-effect, through the intentional stance, and into a kind of beautiful madness. *What is it doing to what does it want to what is it doing* again. I kept diving through the dataset, trying one analytical strategy and then another, hoping that somewhere in the numbers and projections I would find it looking back out at me. I didn't sleep. I ate rarely. The others followed suit. Trinh suffered a psychotic break, which proved something of a blessing as it marked the end of her coughing and sighs.

Listening to the voices of Eros—human voices of the subjects preserved even as the flesh had been remade, reconfigured—I came to grips with the truth. Too many simplifying assumptions, too little imagination on our part, and the utter alienness of the protomolecule conspired to overthrow all our best intentions. The behavior of the particles had changed not only in scale but in kind and continued to do so again at increasingly narrow intervals. The sense of watching a countdown grew into a certainty, though to what, I couldn't say.

I should probably have been afraid.

With every new insight in the long, unbroken stretch of consciousness that predates even humanity, a first moment comes. For an hour or a day or a lifetime, something new has come into the world. Recognized or not, it exists in only one mind, secret and special. It is the bone-shaking joy of finding a novel species or a new theory that explains previously troubling data. The sensation can range from something deeper than orgasm to a

small, quiet, rapturous voice whispering that everything you'd thought before was wrong.

Someone would have to be brilliant and driven and above all lucky to have even a handful of moments like that in the span of a stellar and celebrated career. I had five or six of them every shift. Each one felt better than love, better than sex, better than drugs. The few times I slept, I slept through dreams of pattern matching and data analysis and woke to the quivering promise that this time, today, the insight might come that made it all make sense. The line that connected the dots. All the dots. Forever. I lived on the edge of revelation like I could dance in flames and not burn. When the end came, it surprised me.

It found me in my cell, silent in the dark, not awake and not asleep, the bed cradling me in its palm like an acorn. The sharp scent of the air recycler's fresh filters reminded me of rain. The voices I heard—clipped, angry syllables—I ascribed to the combination of listening to Eros for hours on end and the hypnagogic twilight of my mind. When the door opened and the three men from security hauled me out, I could almost have believed it was part of my dream. Seconds later, the alarms shrieked.

I still don't know how the Belters discovered Thoth Station. Some technical failure, some oversight that left the trail that came to us, the inevitable information leakage that comes from working with people. Station security pushed us like cattle, hurrying us down the corridors. I assumed our path ended in evacuation craft. It didn't.

In the labs, they lined us up at our workstations. Fong commanded the group in my room. It was the first time I'd recognized her as anything but another anonymous extension of the lump of biomass and demands that was security. She gestured to our workstations with her nonlethal riot gun. All their weapons were designed for controlling research, not defending the station.

"Purge it," Fong said. "Purge everything."

She might as well have told us to chew our fingers off. Lodge crossed her arms. Quintana spat on the floor. Fear glinted in Fong's eyes, but we defied her. It felt like nobility at the time. Ten minutes later, the Belters broke through. They wore no standard uniform, carried no unified weapons.

They shouted and screamed in shattered bits of half a dozen languages. A young man with tattoos on his face led the charge. I watched Fong's eyes as she reached her conclusion and lifted her hands over her head. We did as she did, and the Belters surrounded us, peppering us with questions I couldn't follow and whooping in a violence-drunk delight.

They threw me to the deck and tied my hands behind my back. Two of them carried Le away as she threatened them with extravagant violence. I don't know what happened to her after that. I never saw her again. I lay with my cheek pressed to the floor harder than I thought the low gravity would allow. I watched their boots and listened to the chatter of their voices. At my workstation, an analysis run ended with a chime and waited for attention that would never come.

Less than two meters from me, the new interpretation that might have been the one, that might have cracked open the mystery, waited for my eyes, and I couldn't get to it. In that moment, I understood fully the depth of the abyss before me. I begged to look at the results. I whined, I wept, I cursed. The Belters ignored me.

Hours later, they hauled me to the docks and into a hastily rigged holding cell. A man with a hand terminal and an accent almost too thick to parse demanded my name and identification. When I told him I didn't have a union representative to contact, he asked if I had family. I said no to that too. We burned at something like a third of a g, but without a hand terminal or access to a control panel, I lost track of time quickly. Twice a pair of young men came and beat me, shouting threats to do worse. They stopped only when the larger of the two started weeping and couldn't be consoled.

I recognized the docking maneuvers only by the shifting vectors of the ship. We had arrived at wherever we were going, for however long we were meant to stay there. Guards came, hauled me out, shoved me in a line with others from Thoth. They marched us as prisoners. Or animals. I felt the loss of the experiment like mourning a death, only worse. Because out there, like hell being the absence of God, the experiment was still going on but it had left me behind.

They kept us in an enormous room.

“How could she not know?” Michio Pa asked me. “If she was dropping glasses and things, she had to notice.”

“One of the features of the illness is that she wasn’t able to be aware of the deficits. It’s part of the diagnosis. Awareness is a function of the brain just like vision or motor control or language. It isn’t exempt from being broken.”

The conference room had a table; soft, indirect lighting; eight chairs built for longer frames than my own; a nonluminous screen displaying Leonardo da Vinci’s sketch of a fetus in the womb; two armed guards on either side of the double doors leading to the hall; Michio Pa wearing sharply tailored clothes that mimicked a military uniform without being one; and me. A carafe of fresh water sat in the center of the table, sweating, four squat glasses beside it. Anxiety played little arpeggios on my nerves.

“So the illness made it so she couldn’t see what the illness was doing to her?”

“It was harder for me than her, I think,” I said. “From outside, I could see what had happened to her. What she’d lost. She caught glimpses now and then, I think, but even those didn’t seem to stay with her.”

Pa tilted her head. I recognized that she was an attractive woman, though I felt no attraction to her and saw none in her toward me. Something focused her on me, though. If not attraction, fascination maybe. I couldn’t imagine why.

“Do you worry about that?”

“No,” I said. “They screened me when I was still on basic. I don’t have that allele. I won’t develop her illness.”

“But something else, something that acts the same way...”

“I went through something like it in college. I won’t be doing that again,” I said and laughed.

Her eyelids fluttered, her mind—I supposed—dancing through a rapid succession of thoughts, each quickly abandoned. She chuffed out a single laugh, then shook her head. I smiled without knowing what I was smiling

about. Her hand terminal chimed, and she glanced at it. Her expression cooled.

“I have to see to this,” she said. “I’ll be right back.”

“I’ll be right here.”

After the guards closed the door behind her, I got up, pacing the room with my hands clasped behind my back. At the Leonardo screen, I stopped and stared. Not at the sketch, but at the reflection of the man looking at it. It had been three days since I’d left the room, and I still struggled to recognize my reflection as my own. I wondered how many people, roughly, went through years without a mirror. Very few, I thought, though I personally knew almost three dozen.

Even with my hair barbered, my scrub-brush beard shaved away, I looked feral. Somewhere during my years in the room, I’d developed jowls. Little sacks of skin puffed under my eyes, a shade darker and bluer than the brown of my cheeks. I had gray hair now, which I’d known intellectually, but seeing it now felt shocking. Quintana’s attacks on me had left no marks. Even the knife wound, cared for by the station’s medical expert system, would leave no scar. Time had done me immeasurably more damage, as it did with everyone. If I squinted, I could still make out traces of the man I thought of when I pictured myself. But only traces. I wondered how Alberto had been able to bring himself to fuck the tired old man in my reflection. But, I supposed, beggars and choosers.

That I would not return to the room seemed a given now. They had not sent me back there, had given me new clothes, new quarters. Even Brown, during his long interrogations, hadn’t been allowed to shave. My naked, white-stubbed chin bore witness to the fact that I’d surpassed him. For the first day, I’d proudly marched out my egg hypothesis for one person, then another, then another, then the first again. Then they gave me a read-only access file that covered the years I had been gone. Two thousand pages, and I read it with the kind of longing and jealousy I imagined of someone following the career of an estranged child. From the uncanny transit of Eros to the surface of Venus to the creation of the ring gate to the discovery and activation of more than a thousand other gates that opened to a thousand

empty solar systems, it filled me with wonder and joy and the bone-deep regret that I hadn't been there to see it happen.

I dropped the egg theory and took up my more natural hypothesis of the gate. They thought they'd given me a cheat sheet, a way to pass myself off as better than I was for the Martian. I wasn't concerned with what they thought. If they considered me a fool, it still wouldn't be less than I thought of them. I could only hope that the negotiation between the Belters and Mars went well. My fate was in their hands, as it had been for years now.

The door opened and Michio Pa returned. The Martian was at her side. The same unfortunate skin, the same nut-brown hair. My heart beat with a violence that left me short of breath, and for a long moment I feared that something dire and medical was happening.

"Dr. Cortázar?" the Martian said.

"Yes," I said, rushing toward him too quickly, pushing my hand out before me like the unfounded presumption of intimacy. "Yes, I am. That's me."

The Martian smiled coolly, but he shook my hand. No physical contact had ever been more electric.

"I understand you've made some sense of our ring gates?"

Michio Pa, at his side, nodded as if unconsciously prompting me.

"Not in exhaustive depth," I said. "But I have the broad strokes."

When he replied, it was like a punch in the gut. "Why did you lie to us at first?"

"About?" I asked, trying to buy time.

He smiled, though the expression had no humor. "You had to know that every sound in that holding cell is monitored and recorded."

No. I hadn't known that. Though in hindsight it seemed obvious.

He continued. "You deliberately fed Dr. Brown a false story about your analysis, then at the last minute gave him the correct version. I'd like to understand why."

"I rethought my..." I began, then trailed off when I saw the knowing look in his eye.

"You were gaming him," the Martian said. "Manipulating him to try to secure your position. Incorrectly believing that we would be traded the least

valuable prisoner.”

The way he said it was not a question, but I found myself nodding anyway.

“The fact that he didn’t spot your falsified conclusions in the data,” the Martian continued, “is the reason you’re here. So, I suppose, your plan failed its way to success.”

“Thank you,” I replied inanely.

“Be aware that we know exactly what you are, what tactics you favor, and will not tolerate this behavior in the future. The consequences of failing to understand this fact of your future existence would be extreme.”

“I understand,” I said, and it was the truth. Something in my expression seemed to please him, and he relaxed a little.

“I am developing something of a private task force to examine the data that’s coming in from the initial probes that have gone through to the other side of the ring gate. Your experience with the initial discovery puts you in a rare position. I’d like you to join us. It won’t be freedom. That was never in cards. But it won’t be here, and it will be work.”

“I don’t need freedom,” I said.

His smile held an echo of sorrow I couldn’t parse. I wondered if Alberto would have known what it meant. The Martian clapped my shoulder and a wave of relief lifted me up.

“Come with me, Doctor,” he said. “I have some things to show you.”

I offered silent thanks to whatever imaginary God was listening and let the Martian lead me to this wide new universe, opening before me.

I did let myself wonder how the room would be without me. Whether Brown would ever understand how I’d outplayed him. Whether Alberto would take another lover. How many years would stretch out before Fong and Navarro gave up hope that I would somehow come back for them all. Questions I did not expect ever to answer, because in the end I didn’t actually care.

James S. A. Corey is the pen name of fantasy author Daniel Abraham and Ty Franck, George R.R. Martin's assistants. They both live in Albuquerque, New Mexico. The first and last name are taken from Abraham's and Franck's middle names, respectively, and S. A. are the initials of Abraham's daughter.

Under that name they wrote *The Expanse*, a series of science fiction novels, novellas, and stories, that has also been adapted for television under the same name.

Prologue: Namono

The rocks had fallen three months ago, and Namono could see some blue in the sky again. The impact at Laghouat—first of the three strikes that had broken the world—had thrown so much of the Sahara into the air that she hadn't seen the moon or stars for weeks. Even the ruddy disk of the sun struggled to penetrate the filthy clouds. Ash and grit rained down on Greater Abuja until it piled up in drifts, changing her city to the same yellow-gray as the sky. Even as she'd helped the volunteer teams to clear the rubble and care for the injured, she'd understood that her wracking cough and the black phlegm she spat out came from breathing in the dead.

Three and a half thousand kilometers stretched between the crater where Laghouat had been and Abuja. The shock wave still had blown out windows and collapsed buildings. Two hundred dead in the city, the newsfeeds said, four thousand wounded. The medical clinics were swamped. If you were not in immediate distress, please stay home.

The power grid degraded quickly. There was no sun to drive the solar panels, and the gritty air fouled the wind farms faster than the teams could clean them. By the time a fusion reactor was trucked north from the yards at Kinshasa, half of the city had spent fifteen days in the dark. With the hydroponic houses and hospitals and government buildings taking precedence, there were still brownouts more days than not. Network access through their hand terminals was spotty and unreliable. Sometimes they were cut off from the world for days at a time. It was to be expected, she told herself, as if any of this could have been foreseen.

And still, three months in, there came a break in the vast, blindfolded sky. As the reddened sun slid toward the west, the city lights of the moon appeared in the east, gems on a field of blue. Yes, it was tainted, dirty, incomplete, but it was blue. Nono took comfort in it as she walked.

The international district was recent, historically speaking. Few of the

buildings were over a hundred years old. A previous generation's fondness for wide thoroughfares between thin, mazy streets and curved, quasi-organic architectural forms marked the neighborhoods. Zuma Rock stood above it all, a permanent landmark. The ash and dust might streak the stone, but they could not change it. This was Nono's hometown. The place she'd grown up, and the place she'd brought her little family back to at the end of her adventures. The home of her gentle retirement.

She coughed out a bitter laugh, and then she just coughed.

The relief center was a van parked at the edge of a public park. It had a leafy trefoil icon on its side, the logo of the hydroponic farm. Not the UN, not even basic administration. The layers of bureaucracy had been pressed thin by the urgency of the situation. She knew she should have been grateful. Some places, vans didn't come at all.

The pack of dust and ash had made a crust over the gently sloping hills where the grass had been. Here and there, jagged cracks and furrows like vast snake tracks showed where children had tried to play anyway, but no one was sliding down it now. There was only the forming queue. She took her place in it. The others that waited with her had the same empty stare. Shock and exhaustion and hunger. And thirst. The international district had large Norwegian and Vietnamese enclaves, but no matter the shade of their skin or the texture of their hair, ash and misery had made a single tribe of them all.

The side of the van slid open, and the queue shifted in anticipation. Another week's rations, however thin they might be. Nono felt a little stab of shame as her turn came near. She'd lived her whole life without ever needing basic. She was one of those who provided for others, not one who needed support. Except that she needed support now.

She reached the front. She'd seen the man handing out the packs before. He had a wide face, brown speckled with black freckles. He asked her address, and she gave it. A moment's fumbling later, he held out a white plastic pack to her with the practiced efficiency of an automaton, and she took it. It felt terribly light. He only made eye contact with her when she failed to move away.

"I have a wife," Namono said. "A daughter."

A flash of raw anger rose in his eyes, hard as a slap. "If they can make the oats grow faster or conjure rice out of thin air, then do send them to us."

Else, you're holding us up."

She felt tears welling up in her eyes, stinging them.

"One to a household," the man snapped. "Move on."

"But—"

"Go on!" he shouted, snapping his fingers at her. "There's people behind you."

She stepped away and heard him mutter something obscene at her as she left. Her tears weren't thick. Hardly enough to wipe away. It was only that they stung so much.

She tucked her relief pack under her arm and, as soon as her eyes had recovered enough to see, put down her head and started home again. She couldn't linger. There were others more desperate or less principled than herself who were waiting at the corners and in the doorways for the chance to steal water filters and food from the unwary. If she didn't walk with purpose, they might mistake her for a victim. For a few blocks, her starved and exhausted mind entertained itself with fantasies of fighting off thieves. As if the catharsis of violence might somehow bring her to peace.

When she'd left their rooms, she'd promised Anna that she'd stop by Old Gino's on the way home and make sure the elderly man was getting to the relief van. But when she reached the turn, she kept going straight. Weariness was already sucking at her marrow, and the prospect of propping the old man up and going back through the queue with him was more than she could face. She'd say she forgot. It would almost be true.

At the curve that led from the wide avenue into the residential cul-de-sac that was home, she found the violent fantasies in her mind had shifted. The men she imagined herself beating until they apologized and begged her forgiveness weren't thieves, but the freckled relief man. *If they can make the oats grow faster.* What was that supposed to mean, anyway? Had he been joking about using their bodies as fertilizer? Had he dared to make a threat against her family? Who in hell did he think he was?

No, a voice said in her mind, as clearly as if Anna had been there to speak the words. No, he was angry because he wanted to help more, and he couldn't. Knowing that all you can give isn't enough is its own burden. That was all. Forgive him.

Namono knew that she should, but she didn't.

Their house was small. A half dozen rooms pressed together like a child

squeezing a handful of damp sand. Nothing quite lined up; no corner was perfectly square. It gave the space the feel of something natural—a cave or a grotto—more than something built. She paused before she opened the door, trying to clear her mind. The setting sun had fallen behind Zuma Rock, and the grit and smoke in the air showed where the wide beams of light streamed past it. It looked like the stone had a halo. And in the darkening sky, a pinpoint of light. Venus. Tonight, there might be stars. She latched onto the thought like a lifeboat in the sea. There might be stars.

Inside, the house was clean. The rugs had been shaken out, the brick floors swept. The air smelled of lilac thanks to the little sachet-and-candle that one of Anna's parishioners had brought them. Namono wiped away the last of her tears. She could pretend the redness in her eyes was only the outside air. Even if they didn't believe her, they could pretend to.

"Hello?" she called. "Is anyone home?"

Nami squeaked from the back bedroom, her bare feet slapping on the brick as she barreled toward the door. Her little girl wasn't so little anymore. She came up to Nono's armpit now. Or Anna's shoulder. The gentle pudge of childhood was gone, and the awkward coltish beauty of adolescence was clearing its throat. Her skin was barely lighter than Nono's and her hair was as rich and kinky, but the girl had a Russian smile.

"You're back!"

"Of course I am," Nono said.

"What did we get?"

Namono took the white relief package and pressed it into her daughter's hands. With a smile that was like complicity, she leaned close. "Why don't you go find out, and then come tell me?"

Nami grinned back and loped off to the kitchen as if the water recyclers and fast-grown oats were a brilliant present. The girl's enthusiasm was vast and partly sincere. The other part was to show her mothers that she was all right, that they didn't need to worry for her. So much of their strength—all their strengths—grew from trying to protect each other. She didn't know if that made it better or worse.

In the bedroom, Anna lay on her cushions. A thick volume of Tolstoy rested beside her, its spine bent by being reread. *War and Peace*. Her complexion was grayish and drawn. Nono sat beside her carefully, putting her hand on the exposed skin of her wife's right thigh just above where her

knee had been crushed. The skin didn't feel hot anymore, and it wasn't stretched drum-tight. Those had to be good signs.

"The sky was blue today," Nono said. "There may be stars out tonight."

Anna smiled her Russian smile, the one her wife's genes had also given Nami. "That's good, then. Improvement."

"God knows there's room for it," Namono said, regretting the discouragement in her voice even as she spoke. She tried to soften it by taking Anna's hand. "You're looking better too."

"No fever today," Anna said.

"None?"

"Well, only a little."

"Many guests?" she asked, trying to keep her tone light. After Anna's injury, her parishioners had made such a fuss, bringing by tokens and offers of support until it was impossible for Anna to rest. Namono had put her foot down and sent them away. Anna had allowed it mostly, she thought, because it also kept her flock from giving away the supplies they couldn't afford to do without.

"Amiri came by," Anna said.

"Did he? And what did my cousin want?"

"We're having a prayer circle tomorrow. Only about a dozen people. Nami helped clean the front room for it. I know I should have asked you first, but ..."

Anna nodded at her distended, swollen leg as if her inability to stand at the pulpit was the worst thing that had happened to her. And maybe it was.

"If you're strong enough," Namono said.

"I'm sorry."

"I forgive you. Again. Always."

"You're good to me, Nono." Then, softly so that Nami couldn't hear them, "There was an alert while you were out."

Namono's heart went cold. "Where's it going to hit?"

"It won't. They got it. But ..."

The silence carried it. But there had been another one. Another rock thrown down the gravity well toward the fragile remnants of the Earth.

"I didn't tell Nami," Anna said, as if protecting their child from the fear was another sin that required forgiveness.

"It's all right," Namono said. "I will if we need to."

“How is Gino?”

I forgot floated at the back of Namono’s throat, but she couldn’t speak the lie. To herself, maybe, but Anna’s clear eyes forbade it. “I’m going there next.”

“It’s important,” Anna said.

“I know. It’s just that I’m so tired—”

“That’s why it’s important,” Anna said. “When the crisis comes, we all pull together naturally. It’s easy then. It’s when things drag on too long that we have to make the effort. We need to make sure everyone sees we’re all in this together.”

Unless another rock came and the Navy didn’t catch it in time. Unless the hydroponics collapsed under the strain and they all went hungry. Unless the water recyclers failed. Unless a thousand different things happened, any one of which meant death.

But even that wouldn’t be failure for Anna. Not as long as they were all good and kind to each other. If they helped carry each other gently into the grave, Anna would feel she was following her calling. Perhaps she was right.

“Of course,” Namono said. “I just wanted to bring the supplies back to you first.”

Nami rushed in a moment later, a water recycler in either hand. “Look! Another glorious week of drinking cleaned-up piss and filthy rainwater!” she said with a grin, and it struck Namono for the millionth time what a perfect distillation of her mothers their daughter could be.

The rest of the package was oatmeal pucks ready to be cooked, packets of something that claimed in Chinese and Hindi to be chicken stroganoff, and a handful of pills. Vitamins for all of them. Painkillers for Anna. So that was something.

Namono sat with her wife, holding her hand until Anna’s eyelids began to droop and her cheeks took on the softness that spoke of coming sleep. Through the window, the last of the twilight glowed red, fading to gray. Anna’s body relaxed a degree. The tightness in her shoulders released. The furrows in her brow smoothed. Anna didn’t complain, but the pain of her injury and the stress of being suddenly crippled had mixed with the fear they all shared. It was a pleasure to watch it all fall away, if only for a moment. Anna was always a handsome woman, but when she slept, she was

beautiful.

Nono waited until her wife's breath was deep and regular before she rose from the bedside. She was almost to the door when Anna spoke, her voice rusty with sleep.

"Don't forget Gino."

"Going there now," Nono said softly, and Anna's breath went back to its deep sleep-slow tide.

"Can I come too?" Nami asked as Nono went back to their street door. "The terminals are down again, and there's nothing to do here."

Nono considered *It's too dangerous out there* and *Your mother might need you*, but her daughter's eyes were so hopeful. "Yes, but put your shoes on."

The walk back to Gino's was a dance in shadows. Enough sunlight had struck the emergency lights' solar panels that half the houses they passed were glowing a little from within. Not much more than a candle's brightness, but more than there had been. The city itself was still black. No streetlights, no glow in the skyscrapers, and only a few bright points along the sinuous length of the arcology to the south.

Namono had the sudden, powerful memory of being younger than her own daughter was now and going up to Luna for the first time. The utter brilliance of the stars and the starkly beautiful Milky Way. Even with the dust grit still in the high air above them, there were more stars out now than when the light pollution of the city had drowned them. The moon shone: a crescent of silver cupping a webwork of gold. She took her daughter's hand.

The girl's fingers seemed so thick, so solid compared to what they had once been. She was growing up. Not their little baby anymore. There had been so many plans for her university and traveling together. All of them gone now. The world they'd thought they were raising her in had vanished. She felt a twinge of guilt about that, as if there were something that she could have done to stop all this from happening. As if it were somehow her fault.

In the deepening darkness, there were voices, though not so many as there had been. Before, there had been some nightlife in the quarter. Pubs and street performers and the hard, rattling music recently come into fashion that clattered out into the street like someone spilling bricks. Now people slept when the darkness came and rose with the light. She caught the

smell of something cooking. Strange how even boiled oats could come to mean comfort. She hoped that Old Gino had gone to the van, or that one of Anna's parishioners had gone for him. Otherwise Anna would insist that he take part of their supplies, and Namono would let her.

But it hadn't happened yet. No need to call for trouble before it came. There was enough on the road already. When they reached the turn to Old Gino's street, the last of the sunlight was gone. The only sign that Zuma Rock was even there was a deeper darkness rising up thousands of meters above the city. The land itself raising a defiant fist to the sky.

"Oh," Nami said. Not even a word so much as the intake of breath. "Did you see it?"

"See what?" Namono asked.

"Shooting star. There's another one. Look!"

And yes, there among the fixed if flickering stars, a brief streak of light. And then another. While they stood there, hand in hand, a half dozen more. It was all she could do not to turn back, not to push her daughter into the shelter of a doorway and try to cover her. There had been an alert, but the remnants of the UN Navy had caught this one. These smears of fire across the upper atmosphere might not even be the debris from it. Or they might.

Either way, shooting stars had been something beautiful once. Something innocent. They would not be again. Not for her. Not for anyone on Earth. Every bright smear was a whisper of death. The hiss of a bullet. A reminder as clear as a voice. *All of this can end, and you cannot stop it.*

Another streak, bright as a torch, that bloomed out into a silent fireball as wide as her thumbnail.

"That was a big one," Nami said.

No, Namono thought. *No it wasn't.*

Chapter One: Pa

You have no fucking right to this!” the owner of the *Hornblower* shouted, not for the first time. “We worked for what we have. It’s *ours*.”

“We’ve been over this, sir,” Michio Pa, captain of the *Connaught*, said. “Your ship and its cargo are under conscript order of the Free Navy.”

“Your relief effort bullshit? Belters need supplies, let them buy some. Mine is mine.”

“It’s needed. If you’d cooperated with the order—”

“You shot us! You broke our drive cone!”

“You tried to evade us. Your passengers and crew—”

“Free Navy, my fucking ass! You’re thieves. You’re *pirates*.”

At her left, Evans—her XO and the most recent addition to her family—grunted like he’d been hit. Michio glanced at him, and his blue eyes were there to meet her. He grinned: white teeth and a too-handsome face. He was pretty, and he knew it. Michio muted her microphone, letting the stream of invective pour from the *Hornblower* without her, and nodded him on. *What is it?*

Evans pointed a thumb toward the console. “So angry,” he said. “Like to hurt a poor coyo’s feelings, he goes on like that.”

“Be serious,” Michio said, but through a smile.

“Am serious. Fragé bist.”

“Fragile. You?”

“In my heart,” Evans said, pressing a palm to his sculpted chest. “Little boy, me.”

On the speaker, the owner of the *Hornblower* had worked himself into a deeper froth. To hear him tell it, Pa was a thief and a whore and the kind of person who didn’t care whose babies died so long as she got her payday. If he was her father, he’d kill her instead of letting her dishonor her family. Evans snickered.

Despite herself, Michio laughed too. “Did you know your accent gets thicker when you flirt?”

“Yeah,” Evans said. “I’m just a complex tissue of affectation and vice. Took your mind off him, though. You were starting to lose your temper.”

“Not done losing it yet,” she said, and turned the mic back to live. “Sir. *Sir!* Can we at least agree that I’m the pirate who’s offering to lock you in your cabin for the trip to Callisto instead of throwing you into space? Would that be all right?”

There was a moment of stunned silence on the radio, then a roar of incoherent rage that resolved into phrases like *drink your fucking Belter blood* and *kill you if you try*. Michio lifted three fingers. Across the command deck, Oksana Busch waved her own hand in acknowledgment and tapped the weapons controls.

The *Connaught* wasn’t a Belter ship. Not originally. She’d been built by the Martian Congressional Republic Navy, and she’d come equipped with a wide variety of military and technical expert systems. They’d been on it for the better part of a year now, training in secret at first. And then when the day came, leading her into the fray. Now Michio watched her own monitor as the *Connaught* identified and targeted six places on the floating cargo ship where a stream of PDC fire or a well-placed missile would peel open the hull. The targeting lasers came on, painting the *Hornblower*. Michio waited. Evans’ smile was a little less certain than it had been. Slaughtering civilians wasn’t his first choice. In fairness, it wasn’t what Michio would have picked either, but the *Hornblower* wasn’t going to make its journey through the gates and out to whatever alien planet they’d thought to colonize. The negotiation now was only what the terms of that failure would be.

“Want to fire, bossmang?” Busch asked.

“Not yet,” Michio said. “Watch that drive. If they try to burn out of here? Then.”

“They try to burn on that busted cone, we can save the ammunition,” Busch said, derision in her voice.

“There’s people counting on that cargo.”

“Savvy me,” Busch said. Then, a moment later, “They’re still cold.”

The radio clicked, spat. On the other ship, someone was shouting, but not at her. Then there was another voice, then several, each trying to cut

above the others. The report of a gun rang out, the sound of the attack pressed thin and nonthreatening by the radio.

A new voice came.

“*Connaught*? You there?”

“Still here,” Michio said. “To whom am I speaking, please?”

“Name’s Sergio Plant,” the voice said. “Acting captain of the *Hornblower*. I’m offering up our surrender. Just no one gets hurt, okay?”

Evans grinned their triumph and relief.

“Besse to hear from you, Captain Plant,” Michio said. “I accept your terms. Please prepare for boarding.”

She killed the connection.

History, Michio believed, was a long series of surprises that seemed inevitable in retrospect. And what was true of nations and planets and vast corporate-state complexes also applied to the smaller fates of men and women. As above, so below. As the OPA and Earth and the Martian Congressional Republic, so with Oksana Busch and Evans Garner-Choi and Michio Pa. For that matter, so with all the other souls who lived and worked on the *Connaught* and her sister ships. It was only because she sat where she did, commanded as she did, and carried the weight of keeping the men and women of her crew safe and well and on the right side of history that the smaller personal histories of the *Connaught*’s crew seemed to have more significance.

For her, the first surprise in the many that had brought her here was becoming part of the military arm of the Belt at all. As a young woman, she’d expected to be a systems engineer or an administrator on one of the big stations. If she’d loved mathematics more than she did, it might have happened. She’d put herself through upper university because she thought she was supposed to, and failed because it had been a horrible fit. When the counselors sent her the message that she was being disenrolled, it had been a shock. Looking back, it was obvious. The clarifying lens of history.

She’d fit better with the OPA, or at least the arm of it she’d joined. Within the first month, it became clear that the Outer Planets Alliance was

less the unified bureaucracy of the revolution than a kind of franchise title adopted by the people of the Belt who thought that something like it should exist. The Voltaire Collective considered itself OPA, but so did Fred Johnson's group based on Tycho Station. Anderson Dawes acted as governor of Ceres under the split circle, and Zig Ochoa opposed him under the same symbol.

For years, Michio had styled herself as a woman with a military career, but with an awareness in the back of her mind that her chain of command was a fragile thing. There was a time it had made her reflexively protective of authority—her authority over her subordinates and the authority of her superiors over her. It was what put her in the XO's chair of the *Behemoth*. What put her in the slow zone when humanity first passed through the gate and into the hub of the thirteen-hundred-world empire to which they were heir. It was what had gotten her lover, Sam Rosenberg, killed. After that, her faith in command structures had become a little less absolute.

Once again obvious in retrospect.

As to the second surprise, she couldn't have said exactly what it was. Falling into a collective marriage or her recruitment by Marco Inaros or taking possession of her new ship and its revolutionary mission with the Free Navy. Lives had more turning points than seams of ore, and not every change was obvious, even looking back.

"Boarding team's ready," Carmondy said, his voice flattened by the suit mic. "You want us to breach?"

As the leader of the assault team, Carmondy was technically in a different branch of command than Michio, but he'd deferred to her as soon as he and his soldiers had come aboard. He'd lived on Mars for a few years, wasn't part of the plural marriage that formed the core of the *Connaught's* crew, and was professional enough to accept his status as an outsider. She liked him for that, if little else.

"Let's let them be nice," Michio said. "If they start shooting at us, do what needs doing."

"Savvy," Carmondy said, and then switched channels.

Both ships were on the float now, so she couldn't lean back in her crash couch. If she'd been able to, she would have.

When the news had come out that the Free Navy was taking control of the system and that the ring gate was closed to through traffic, the fleet of colony ships on the burn for the new worlds beyond faced a choice. Stand down and give their supplies over for redistribution to the stations and ships most in need, and they would be allowed to keep their ships. Run, and they wouldn't.

The *Hornblower*—like who knew how many others—had done the calculation and decided the risk was worth the reward. They'd killed their transponders, spun their ship, and burned like hell, but briefly. Then spun again, burned again, spun again, burned. Hotaru, they called it. The strategy of going bright only for a moment, and then going dark in hopes that the vastness of space would conceal them until the political situation changed. The ships had enough food and supplies to last the would-be colonists for years. The volume of the system was so massive that if they avoided detection at the front, finding them later could be the work of lifetimes.

The *Hornblower's* drive plume had been detected by Free Navy arrays on Ganymede and Titan both. The thing she hated most was that the chase had led them up out of the plane of the ecliptic. The vast majority of the sun's heliosphere extended above and below the thin disk where the planets and the asteroid belt spun in their orbits. Michio had a superstitious dislike of those reaches, the huge emptiness that, in her mind, loomed above and below human civilization.

The ring gate and the unreal space beyond it might be stranger—were stranger—but her unease about traveling outside the ecliptic had been with her since childhood. It was part of her personal mythology, and a herald of bad luck.

She set her monitor to show the boarding team's suit cameras and play soft music. The *Hornblower*, as seen through twenty different perspectives while harps and finger drums tried to soothe her. A dark-skinned Earther was in the airlock, his arms spread wide. Half a dozen of the cameras were locked on him, barrels of their weapons visible. The others shifted, watching for movement on the periphery or coming from outside the ship. The man reached up and used a handhold to flip himself around, putting his arms behind him for the zip-tie restraint. It had a sense of practice that left

Michio thinking that Captain Plant—if that's who this was—had been forcibly detained before.

The boarding team moved into the ship, its eyes and attention shifting down the corridors in teams. Movement on one screen mapped to a figure seen in another. When they reached the galley, the crew of the *Hornblower* floated in ranks, arms out, ready to accept whatever fate the *Connaught* had in store for them. Even at the very small size the individual panes had taken to fit her monitor, she could see the clinging sheen of tears creeping over the captives' faces. Grief masks formed of saline and surface tension.

"They're going to be fine," Evans said. "Esá? It's our job, yeah?"

"I know," Michio said, her gaze fixed on the screen.

The boarding team moved through the decks, locking down control. Their coordination made them feel like a single organism with twenty eyes. The group consciousness of professionalism and drills. The command deck looked ill kept. A hand terminal and a drinking bulb on the float had been sucked against an air intake. Without thrust gravity to coordinate them, the crash couches lay at a variety of angles. It reminded her of old videos she'd seen of shipwrecks back on Earth. The colony ship was drowning in the endless vacuum.

She knew that Carmondy would be calling her before he did it, and drew the music gently down. The request came through with a polite chime.

"We've taken control of the ship, Captain," he said. Two of his men were watching him say it, so she saw his lips and his jaw making the words from two angles even as she heard them. "No resistance. No trouble."

"Officer Busch?" Michio said.

"Their firewalls are already down," Oksana said. "Toda y alles."

Michio nodded, more to herself than to Carmondy. "The *Connaught* has control of the enemy ship's systems."

"We're setting a perimeter and securing the prisoners. Automatic check-in set."

"Understood," Michio said. Then, to Evans, "Let's pull back far enough to be outside the blast range if it turns out they're hiding nukes in the grain silo."

"On it," Evans said.

The maneuvering thrusters shifted her against her restraints, not even a tenth of a g, for the burn's scant handful of seconds. Taking the things that

other people thought they deserved to keep was dangerous work. The *Connaught* would watch over the boarding team of course, the ship's gentle fingers on all their pulses. And in addition, Carmondy would ping every half hour using a onetime pad protocol. If he failed to check in, Michio would turn the *Hornblower* into a diffuse cloud of hot gas as a warning to the next ship. And a few thousand people on Callisto, Io, and Europa would have to hope the other Free Navy conscription missions came through.

The Belt had finally shrugged off the yoke of the inner planets. They had Medina Station at the heart of the ring gates, they had the only functioning navy in the solar system, and they had the gratitude of millions of Belters. In the long term, it was the greatest statement of independence and freedom the human race had ever made. In the short term, it was her job to see the victory didn't starve them all to death.

For the next two days, Carmondy and his men would see that the would-be colonists were sealed on secured decks, where they could ride out the transit to a stable orbit around Jupiter. Then make a complete inventory of what had been gained by the taking of the *Hornblower*. Once they were done, it would still be a week before the salvage drives were in place. In that time, the *Connaught* would stand as guard and captor, and little enough for Michio to do but scan the darkness for other refugees.

She wasn't looking forward to it, and she was sure the others in her marriage group weren't either. Still, there was more than that in Oksana's voice when she spoke.

"Bossman. We got confirmation from Ceres."

"Good," Michio said, but with an uptick in her inflection that meant she'd heard whatever Oksana wasn't saying. Oksana Busch had been her wife almost as long as the group had been together. They knew each other's moods well.

"Got something else too. Message from himself."

"What does Dawes want?" Michio asked.

"Not Dawes. *Big* himself."

"Inaros?" Michio said. "Play it."

"Under captain-only encrypt," Oksana said. "I can pipe it to your cabin or your terminal if—"

"Play it, Oksana."

Marco Inaros appeared on the monitor. From the drape of his hair, he

was either on Ceres or under burn. There wasn't enough visible background behind him to say if he was on a ship or in an office. His smile was charming and reached his warm, dark eyes. Michio felt her pulse step up a little, and told herself it was dread and not an attraction. For the most part, that was truth. He was a charismatic bastard, though.

"Captain Pa," Marco said. "I'm glad to hear you took the *Hornblower* cleanly. It's another testament to your ability. We were right to have you in command of the conscription. Things have gone well enough, we're ready to move on to the next stages of our plan."

Michio glanced over at Evans and Oksana. He was plucking at his beard, and she was trying not to look at Michio.

"We'll want to route the *Hornblower* directly to Ceres," Marco said. "And before that, I'm calling a meeting. Strictly inner-circle. You, me, Dawes, Rosenfeld, Sanjrani. At Ceres Station." His grin widened. "Now that we're running the system, there are some changes we should make, eh? The *Pella* says you can make it there in two weeks. It'll be good to see you in person."

He made a sharp Free Navy salute. The one he'd come up with. The screen went blank. The mix of confusion and distress and relief that flooded Michio's gut wasn't easy to make sense of. Having her mission change like that, so quickly and with so little explanation, left her on the wrong foot. And going into a meeting of the inner circle still had a little of the sense of danger that it had before the Free Navy had announced itself. Years of moving in shadows left habits of thought and feeling that were hard to step out of, even if they'd won. But at least they'd be back in the plane of the ecliptic, and not high up in the black, where ominous things happened. Bad things.

Things, a small, still voice in her head said, *like being called to an unexpected meeting*.

"Two weeks?" Michio asked.

"Possible," Busch answered almost before the question was out. She'd already run the plan. "But it'll mean burning hard. And no waiting for the *Hornblower*."

"Carmondy won't like that," Pa said.

"What's he going to say?" Oksana said. "It's himself giving the order."

"It is," Michio agreed.

Evans cleared his throat. "So we're going?"

Michio held up a fist. Yes. "It's Inaros," she said, ending the coming argument by invoking his name.

"Well. Bien," Evans said, but the tone of his voice said something different.

"Something?" Pa asked.

"Just isn't the first time plans changed," Evans said, his face wrinkled with worry. He wasn't as pretty that way, but he was her newest husband, so she didn't point it out. Pretty men could be so fragile.

"Continue," she said instead.

"Well, there was the money thing with Sanjrani. And the Martian prime minister wound up making it safe to Luna when half the Free Navy was trying to take him out. And I hear we tried to kill Fred Johnson and James Holden both, and both still breathing and walking free. Leaves me wondering."

"Like maybe Marco isn't as infallible as he plays?" Michio asked.

For a moment, he didn't answer. She thought he might not. "Something like," Evans finally said. "But even thinking like that feels like it might get sticky, no?"

"Something like," Michio agreed.

Chapter Two: Filip

There was no one he hated more than James Holden. Holden, the peacemaker who'd never made peace. Holden, the champion of justice who'd never sacrificed anything for justice. James Holden, who crewed up with Martians and Belters—with *one* Belter—and moved through the system as if it made him better than everyone else. Neutral and above the fray while the inner planets shoved humanity's resources out to the thirteen hundred-odd new planets and left the Belters to die. Who, against all odds, hadn't died with the *Chetzemoka*.

Fred Johnson, the Earther who'd gone native and started speaking for the Belt, was a close second. The Butcher of Anderson Station, who'd made his career by slaughtering innocent Belters and continued it by patronizing them all into an arc that led toward their cultural and individual deaths. For that he deserved hatred and disdain. But Filip's mother hadn't died directly because of Johnson, and so Holden—James *pinché* Holden—owned first prize.

It was months since Filip had beaten his hands against the inner door of the airlock while his mother, her mind twisted by too much time in Holden's cultlike presence, had spaced herself and Cyn along with her. Stupid deaths. Needless. That, he told himself, was why it hurt so much. That she hadn't needed to die, and she'd chosen it anyway. He'd broken his hand trying to get her to stop, but it hadn't helped anything. Naomi Nagata had picked a bad death in the void over a life with her true people. It was proof of how much power Holden had had over her. How deeply she'd been brainwashed, and how weak her mind had been from the start.

He didn't tell anyone on the *Pella* that he still dreamed about it every night: the closed door, the certainty that something precious—something *important*—was on the other side of it, and the sense of vicious loss that he couldn't make the door open. If they knew how much it haunted him, he'd

seem weak, and his father didn't have room for men who couldn't do their part. Not even his own son. Filip took his place as a Belter and a man of the Free Navy or he found a place on a station and stayed there as a boy. He was nearly seventeen now; he'd helped to destroy the oppressors on Earth. His childhood belonged in his past.

Pallas Station was one of the oldest in the Belt. The first mines had been there, and following them, the first refineries. The newer facilities had followed, because this was where the industrial base was. And because it was easier to use the older, unretired crushers and spin separators as overflow capacity. And from habit. Pallas had never been spun up. The gravity it had was the naturally occurring microgravity of its mass—two percent of Earth's full g. Hardly more than a persistent direction of drift. The station swooped above and below the plane of the ecliptic, like it was trying to elbow its way out of the solar system. Ceres and Vesta were larger and more populous, but the metal for ship plating and reactors, for station decks and shipping containers, for the guns that studded the Free Navy's liberated warships and the rounds that they fired all came from here. If Ganymede was the breadbasket of the Belt, Pallas was its forge.

It only made sense that the Free Navy should pass through there in its constant voyage through the liberated system, and that it should make sure to leave no resources behind.

"S'yahaminda, que?" the harbormaster said, floating in the meeting room's wider end. It was a Belter room. No tables, no chairs. Little reference to up or down in its architecture. After so long in a ship built with thrust gravity in mind, Filip thought it felt like home. Authentic in a way that the Martian-designed spaces never could.

The harbormaster himself was the same. His body was longer than someone who'd spent their childhood with even low, intermittent gravity. His head was larger compared to his body than Filip's or Marco's or Karal's. The harbormaster's left eye was milky and blind where even the pharmaceutical cocktail that made human life in freefall possible had been insufficient to keep the capillaries from dying. He was the kind of man who

would never be able to tolerate living on a planetary surface, even for a short period of time. The most extreme end of the Belter physiological spectrum. He was exactly who the Free Navy had risen up to protect and represent.

Which was likely why he seemed so confused and betrayed now.

“Is it a problem?” Marco said, shrugging with his hands. The way he said it made emptying the warehouses into the void seem like an everyday thing to ask. Filip hoisted his own eyebrows to echo his father’s disbelief. Karal only glowered and kept one fist on his sidearm.

“Per es esá mindan hoy,” he said.

“I know it’s everything,” Marco said. “That’s the point. So long as it’s all here, Pallas will be a target for the inners. Put what you have in containers, fire them off, and only we will know their vectors. We’ll track where they are and salvage what we need when we need it. It’s not just keeping it out of their hands, it’s showing that the station warehouses are empty before they even reach for them, yeah?”

“Per mindan ...” the harbormaster said, blinking in distress.

“You’ll be paid for it all,” Filip said. “Good Free Navy scrip.”

“Good, yeah,” the harbormaster said. “Aber ...”

His blinking redoubled and he looked away from Marco as if the admiral of the Belters’ first real armed force was floating half a meter left of where he was. He licked his lips.

“Aber?” Marco prompted, matching his accent.

“Spin classifiers v’reist neue ganga, yeah?”

“If you need new parts, then buy new parts,” Marco said, his voice taking on a dangerous buzz.

“Aber ...” The harbormaster swallowed.

“But you used to buy from Earth,” Marco said. “And our money doesn’t spend there.”

The harbormaster lifted a fist in acknowledgment.

Marco’s smile was gentle and open. Sympathetic. “No one’s money spends there. Not anymore. You buy from the Belt now. Just the Belt.”

“Belt don’t make good parts,” the harbormaster whined.

“We make the best parts there are,” Marco said. “History’s moved on, my friend. Try to keep up. And package everything there is for push-out, sa sa?”

The harbormaster met Marco's gaze and lifted his fist again in assent. It wasn't as if he had a choice. The advantage of being in command of all the guns was that no matter how nicely you asked for something, it was still an order. Marco pushed off, the thin gravity of Pallas bending the path of his body. He stopped his motion by grabbing handholds at the harbormaster's side, and then embraced him. The harbormaster didn't hug him back. He looked like a man holding his breath and hoping something dangerous wouldn't notice him as it passed by.

The corridors and passageways leading from the harbormaster's office to the docks were a patchwork of ancient ceramic plating and newer carbon-silicate lace. The lace plating—one of the first new materials put into manufacture after the protomolecule's appearance threw physical chemistry ahead by a few generations—had an eerie rainbow sheen as they floated past it. Like oil on the surface of water. It was supposed to be more resilient than ceramic and titanium, harder and more flexible. No one knew how it would age, though if reports from the other worlds were to be trusted, it would likely outlast the people who'd fashioned it by at least an order of magnitude. Assuming they were making it right. Hard to know.

The Pallas shuttle was waiting when they reached it, Bastien strapped into the pilot's couch.

"Bist bien?" he asked as Marco cycled the airlock closed behind them.

"As well as could be hoped," Marco said, glancing around the small craft. Six couches, not counting Bastien's pilot's station. Karal was strapping into one, Filip into another. But Marco drifted slowly to the shuttle's floor, his hair settling at his shoulders. He lifted his chin as a question.

"Rosenfeld went already," Bastien said. "Been on the *Pella* for three hours."

"Has he now," Marco said, and his voice had an edge that maybe only Filip could hear. He slid into his couch and cinched down the straps. "That's good. Let's join up."

Bastien cleared with the dock control system, more from habit than need. Marco was captain of the *Pella*, admiral of the Free Navy, and his shuttle would take precedence over any other traffic. But Bastien checked anyway, then went through the seals and environment controls again, for what was likely the tenth time. For anyone raised in the Belt, checking the

air and the water and the seals on ships and suits was like breathing. Not something you even thought about, just something that happened. People who didn't live that way tended to leave the gene pool early.

They grew a degree heavier as the shuttle launched, then the gimbals in the couches all hissed at once as Bastien fired the maneuvering thrusters. It wasn't even a quarter-g burn, and still they reached the *Pella* in minutes. They cycled through the lock—the same one Naomi had chosen to die in—then floated out into the familiar air of the *Pella*.

Rosenfeld Guoliang was waiting for them.

All through Filip's life, from his very first memories, the Belt had meant the Outer Planets Alliance, and the OPA had meant the people who mattered most. His people. It was only as he'd grown up and started being allowed to listen when his father spoke with other adults that his understanding of the OPA became deeper, more nuanced, and the word that redefined his people was *alliance*. Not *republic*, not *unity government*, not *nation*. Alliance. The OPA was a numberless wash of different groups that formed and fell apart and formed again, all of them tacitly agreeing that, whatever their disagreements might be, they were united against the oppression of the inner planets. There were a few large standard bearers under the OPA's flag—Tycho Station under Fred Johnson, and Ceres Station under Anderson Dawes, each with their militias; the ideological provocateurs of the Voltaire Collective; the openly criminal Golden Bough; the nonviolent near-collaborationist Maruttuva Kulu. For each of those, there were dozens—hundreds, maybe—of smaller organizations and associations, cabals and mutual interest societies. What brought them together was the constant economic and military oppression of Earth and Mars.

The Free Navy was not the OPA, and it was not meant to be. The Free Navy was the strongest of the old order, forged together into a force that didn't need an enemy to define it. It was a promise of a future in which the yoke of the past was not only shrugged off but broken.

That didn't mean it was *free* from the past.

Rosenfeld was a thin man who managed to slouch even on the float. His skin was dark and weirdly pebbled, his eyes sunk deep in their sockets. He had tattoos of the OPA's split circle and the knifelike V of the Voltaire Collective, a bright and ready smile, and a sense of barely contained

violence. And he was the reason Filip's father had come to Pallas.

"Marco Inaros," Rosenfeld said, spreading his arms. "Look what you've done, coyo mis!"

Marco launched himself forward into the man's embrace, spinning with him as they held close and slowing when they pulled back. Any distrust Marco held toward Rosenfeld was gone. Or no, not gone, but shifted away for Filip and Karal to feel so that his own pleasure at the reunion could be pure.

"You look good, old friend," Marco said.

"I don't," Rosenfeld said, "but I appreciate the lie."

"Do we need to transfer your men over?"

"Already done," Rosenfeld said, and Filip glanced to Karal, catching the little scowl at the corner of the older man's mouth. Rosenfeld was a friend, an ally, one of the inner circle of the Free Navy, but he shouldn't have been able to bring his private guard on the ship when Marco wasn't there. The *Pella* was the flagship of the Free Navy, after all, and temptation was temptation. Marco and Rosenfeld reached out together, slowed their two-body rotation with a handhold jutting off the lockers, and still arm in arm, pushed out to the corridor and into the ship. Filip and Karal followed after.

"Going to be a hard burn getting to Ceres in time for the meeting," Marco said.

"Your fault. I could have taken my own ship."

"You don't have a gunship."

"I've lived my whole life in rock hoppers—"

Even with only the back of his father's head to see, Filip could hear the smile in Marco's voice. "That was your whole life until now. We've changed the game. Can't have the high command moving unprotected. Even out here, not everyone's with us. Not yet."

They reached the lift that ran the length of the ship, shifted around it, and swam headfirst through the air, down toward the crew decks. Karal looked behind, toward the operations and flight decks, as if to be sure none of Rosenfeld's guard were at their six.

"Why I waited," Rosenfeld said. "The good little soldier, mé. Too bad about Johnson and Smith making it safe to Luna. Only took down one out of three?"

"Earth was the one that mattered," Marco said. Ahead of them, Sárta

appeared, floating up past them toward ops. She nodded her greeting as they passed. “Earth was always the prime target.”

“Well, Secretary-General Gao’s with her gods now, and I hope she died screaming”—Rosenfeld mimed spitting to the side after he said it—“but this Avasarala who’s taken her place—”

“A bureaucrat,” Marco said as they hauled themselves around the corner and into the mess. The tables and benches bolted to the floor, the smell of Martian military food, the colors that had until recently been the banner of the enemy. They all stood in contrast to the men and women in the space. Belters all, and still Filip could pick out the Free Navy he served with from Rosenfeld’s guard. Self from not-self. They could pretend the division wasn’t there, but they all knew better. A dozen people, all told, like it was the change of shift. One of the *Pella*’s crew for each of Rosenfeld’s, so Karal wasn’t the only one to think a little vigilance between friends was a good thing.

One of the guards tossed Rosenfeld a bulb. Coffee, tea, whiskey, or water, there was no way to know. Rosenfeld caught it without missing a beat in the conversation. “Seems like a bureaucrat with a hate on. You think you can handle her? Nothing personal, coyo, but you’ve got a blind spot underestimating women.”

Marco went still. Even as Filip saw it, his mouth flooded with a coppery taste. Karal grunted softly, and when Filip looked to him, his jaw had slid forward and his hands were fists at his sides.

Rosenfeld took a place against a wall, his expression a mask of empathy and apology. “But maybe this isn’t the place to say it. Sorry for the sore spot.”

“Nothing hurt,” Marco said. “We’ll chew it all through on Ceres.”

“Gathering of the tribes,” Rosenfeld said. “Looking forward to it. Next phase should be interesting.”

“Will be,” Marco said. “Karal can put you and yours in the right cabins. Should plan to keep there. It’s going to be a hard burn.”

“Will do, Admiral.”

Marco pulled himself out of the room, floating down toward the machine shop and engineering without so much as meeting Filip’s eye.

Filip waited for a moment, uncertain whether to follow or stay here, whether he’d been dismissed from duty or was still at his post. Rosenfeld

smiled and winked a bumpy eyelid at him before turning to his men. Something had happened there; he could feel it in the air and in the way Karal held himself. Something important. And from the way his father acted, he had to think it was something to do with him.

He put his hand on Karal's wrist. "What is it?"

"Nothing," Karal said, lying badly. "Nothing to worry over."

"Karal?"

The older man pressed his lips together, stretched his neck. He didn't look at Filip.

"Karal. Something I should ask *them*?"

Slowly, Karal shook his head. He shouldn't ask. Karal licked his lips nervously, shook his head again, sighed, and spoke low and calm. "Was a report back a while. Observation data from the ... ah ... from the *Chetzemoka*. About how the ships with Johnson and Smith didn't die?"

"And?"

"And," Karal said, the word as dense as lead.

Then he went on, which was how Filip Inaros, in front of Rosenfeld and his half dozen smirking guards, learned that his mother was still alive. And that everyone on the *Pella* knew it but him.

Under burn, he dreamed.

He was standing at the same door as before. Even though it would change what it looked like, it was always the same door. He was screaming, beating his hands against it, trying to get in. Before, there had been the sense of fear, the oceanic sorrow of impending loss, the dread. Now there was only humiliation. Rage lit him like a fire, and he pushed to get through the door, into whatever chamber lay beyond it, not to save something precious but to end it.

And shouting, he woke. The weight of a full g pressed him into the gel. The *Pella* murmured around him, the vibration of the drive and the hushing of the air recyclers like a voice whispering something just too softly to make out. It was an effort to wipe away the tears. They weren't tears of sorrow. For that he'd have to be sad. He was only certain.

There was someone he hated more than James Holden.

OceanofPDF.com

Chapter Three: Holden

There was something to be said for living a life that didn't involve lengthy interrogations. By that standard, at least, Holden had not lived his well. When he and the rest of the *Rocinante*'s crew had agreed to be debriefed, he'd guessed that it would be more than just the events surrounding the attack on Earth by the Free Navy. There was more than enough to talk about, after all. The chief engineer on Tycho Station who'd been exposed as a mole for Marco Inaros, the abduction and rescue of Monica Stuart, the loss of the protomolecule sample, the attack that had nearly killed Fred Johnson. And that was just for him. Naomi and Alex and even Amos would have whole volumes of their own to contribute.

He hadn't expected that the questioning would spread out from there like a gas to fill all available space. For weeks now, his days had been filled with twelve to sixteen hours of talking through anything and everything in his life. The names and histories of all eight of his parents. His school records. His abortive naval career. What he knew about Naomi, about Alex, about Fred Johnson. His relationship with the OPA, with Dmitri Havelock, with Detective Miller. Even after hours of review, he wasn't sure about that last one. Sitting in the small room across from the UN interrogators, Holden had done his best to take apart his life until that point and lay it open before them.

The process chafed him. The questions cycled back and jumped around, as if they were trying to catch him out in a lie. They went into strange little cul-de-sacs—What were the names of the people he'd served with in the Navy? What did he know about each of them?—and stayed there far longer than seemed justified. His two primary questioners were a tall, light-skinned woman with a long, serious face named Markov and a short, pudgy man called Glenndining with hair and skin the same color of brown. They took turns pushing him and building rapport, subtly cutting him down to see

if he'd get angry and what he'd say when he did, and then being almost uncomfortably affectionate with him.

They brought him limp, greasy sandwiches to eat or fresh pastries with some of the best coffee he'd ever had. They turned the lights down almost to darkness or brightened them until they were nearly blinding. They strolled in the hopping lunar shuffle down through the hallways from the docks or they stayed in a cramped steel box of a room. Holden felt as though his personal history was being scraped down to dry pulp like a lime at a really cheap bar. If there was a drop more of juice in him, they'd press it out somehow. It was easy to forget that these were his allies, that he'd agreed to this. More than once, he'd been curled up in his bunk after a long day, hovering on the edge of sleep, and found his mind half-dreaming plans to break the ship out of prison and escape.

It didn't help that, in the dark sky above them, Earth was dying by centimeters. The newsfeeds that remained had mostly relocated to the Lagrange stations and Luna, but a few were still functioning down on the planetary surface. Between the interrogation sessions and sleep, Holden didn't have much time to watch them, but the snippets he heard were enough. Overstrained infrastructure, ecosystem trauma, chemical changes in the ocean and atmosphere. There had been thirty billion people on the overcrowded Earth, dependent on a vast network of machinery to keep them fed and hydrated and not drowning in their own waste. A third of those, by the more pessimistic estimates, had already died. Holden had seen a few seconds of a report discussing how the death count in Western Europe was being done by assaying atmospheric changes. How much methane and cadaverine were in the air let them guess how many people were rotting in the ruined streets and cities. That was the scale of the disaster.

He'd felt guilty turning the feed off. The least he could do was watch. Be there as the ecosphere that bore him and his family and everyone else not very many generations back collapsed. Earth deserved witnesses. He was tired though, and frightened. Even after he'd killed the feed, he hadn't been able to sleep.

Not all the news was bad. Mother Elise got a message through to him that the farm in Montana, while badly damaged, had proven self-sufficient enough to keep his parents alive. There was even enough surplus that they'd been able to help with some of the relief efforts in Bozeman. And as the

muddy clouds of grit and ash settled down to poison the oceans, more and more relief flights had been able to dive down the gravity well and come back up filled with refugees.

The physical capabilities of Luna Base were beginning to be stressed, though. The air recyclers were being pushed to their limits so that every breath Holden took in the halls and corridors of the station felt like it had just come out of someone else's mouth. Cots and privacy tents filled the food courts and public spaces. The crew of the *Rocinante* had given up their quarters in the station and moved back onto the ship to make more space. And also to live in their own bubble of clean air and well-filtered water. It was a little disingenuous to pretend the move was altruistic. The ship was quiet and empty and familiar. The only things that kept Holden from feeling perfectly comfortable were the silence that came from the powered-down reactor and the ghostlike presence of Clarissa Mao.

"Why does she bother you so much?" Naomi asked. They were in their shared cabin, held to the bunk by the moon's fractional gravity and their own exhaustion.

"She killed a bunch of people," Holden said, his sleepiness robbing him of the ability to think clearly. "Is that not enough? It seems like it should be enough."

The cabin was at low light. The crash couch cradled their paired bodies. He felt Naomi's breath against his side, familiar and warm and grounding. Her voice had the same slushy softness as his. They were both almost too tired to sleep. "That was a different her."

"Everyone else seems certain of that. Not sure how we got there."

"Well, I think Alex is still not sure about her."

"But Amos is. And you are."

She made a thick sound in the back of her throat. Her eyes were closed. Even in the dimness, he could see the deeper darkness of her lids. He thought for a moment she'd managed to fall asleep, but then she spoke. "I have to believe she can change. That people can."

"You weren't like her," Holden said. "Even when ... even when people died, you weren't like her. You're not a cold-blooded killer."

"Amos is."

"True. But Amos is Amos. It's different in my head."

"Because?"

“Because he’s Amos. He’s like a pit bull. You know he could tear your throat out, but he’s loyal to a fault and you just want to hug him.” She smiled slowly. She could do that. A drawing up of a muscle in her face, and Holden filled with hope and warmth and even a kind of grim optimism that said the universe couldn’t all be shit if it had a woman like this in it. He rested his hand on her hip. “You didn’t fall in love with me for my ethical consistency, did you?”

“Despite it,” she chuckled. Then a moment later, “You had a cute butt.”

“Had? Past tense?”

“I need to get back on the system,” she said, changing the subject. “Don’t let me fall asleep until I’ve checked for updates.”

“The missing ships?” he asked, and she nodded.

As hard as his own inquisition had been, Naomi’s was worse. She’d always been quiet about her past, about how she’d become the woman she was. Now she had traded that privacy away for a blanket amnesty for the crew, and for herself. Her versions of Markov and Glenndining weren’t just asking about a failed naval career and contract work for Fred Johnson. She was their window straight into Marco Inaros. She’d been his lover. The mother of his child, a fact Holden was still trying to wrap his head around. She’d been held captive on his flagship before and after the hammer fell on Earth. He knew the toll the marathon debriefing was taking on him. It had to be a thousand times harder for her.

Which, he assumed, was why she threw herself into the mystery of the missing ships. She’d been the first among them to notice that the set of vessels that had vanished in their transits through the ring gates and the stolen Martian warships that became the Free Navy didn’t overlap. Some ships were stolen by Marco and his crew, and some just vanished without a trace. There were two things going on, and he couldn’t begrudge her wanting to spend her off time focused on the other one.

But she had to sleep. If for no other reason than his belief that if she finally slept, he would too.

“I promise nothing,” he said.

“Okay,” she said. “Then wake me up early so I’ll have time to check before the next session.”

“Promise.”

He lay beside her in the gloom until her breath stuttered, deepened,

became the regular, powerful pulse of sleep. When he was still awake after five minutes of listening to her, he knew his own rest wasn't coming. He stood, and for a moment, she went silent, moving up toward wakefulness before the deep breath returned. Holden let himself out.

The halls of the *Rocinante* were also dim, set for a night cycle. Holden made his way to the lift. Voices filtered to him from the galley: Amos' affable rumble and the thinner, reedy sound of Clarissa's voice. He paused, listened, then hauled himself up the ladder to the ops deck. The lunar gravity was light enough that using the lift seemed silly, so he just pulled himself up, hand over hand, until he got there. The cabin lights were out, so Alex was only lit by the backslash from the screen.

"Hey there," Alex drawled as Holden settled himself into a couch. "Can't sleep?"

"Apparently not," Holden sighed. "You?"

"I hate the gravity here. It feels like we're moving too slow. I keep wanting to gun the engines. But there aren't any engines and we aren't going anywhere. It should be a drive holdin' me down, but it's just a big hunk of rock." Alex gestured toward the newsfeed playing silently on his screen. A woman in a bright red hijab was speaking earnestly into the camera. Holden recognized her as a well-respected Martian journalist, but he couldn't remember her name. "It just keeps coming. They're calling it a mutiny. Keep talking about dereliction of duty and abandoning their post and black market sales of equipment."

"That doesn't sound good."

"Sounds better than what it was," Alex said. "It was a coup. It was a civil war, only instead of fighting, a fifth of the military just packed themselves off through the ring gates with all our stuff. Well, all our stuff they didn't trade to these Free Navy assholes."

"Any word where they were going?"

"Nope," Alex said. "At least none they're reporting."

The woman in the hijab—Fatim Wilson, *that* was the name—vanished, but the feed spooled on with images of empty docks on Mars and then a group of protesters milling around and shouting at the camera. Holden couldn't tell what they were for or against. The way things were now, he wasn't sure they'd have been able to tell him either.

"If they ever come back, they'll all be tried for treason," Alex said.

“Makes me think they weren’t planning to get back home anytime soon.”

“So,” Holden said. “Martian coup. Free Navy killing the shit out of Earth. Pirates stripping down all the colony ships that were heading out. Medina Station’s gone dark. And we-don’t-know-what eating some of the ships that go through the gates.”

Alex opened his mouth to reply, but his screen flicked and chimed. A high-priority connection request.

“One damned thing after another,” Alex said, accepting the connection, “when it ain’t a whole bunch of damned things at once.”

Chrisjen Avasarala appeared on the screen. Her hair was perfectly in place, her sari a gemlike shimmering green. Only her eyes and the set of her mouth showed the fatigue.

“Captain Holden,” she said. “I need to meet with you and your crew. At once.”

“Naomi’s asleep,” Holden said without pausing to think. Avasarala smiled. It wasn’t a pleasant expression. “So I’ll go wake her up. And we’ll be right over.”

“Thank you, Captain,” the acting ruler of Earth said and signed off.

Silence filled the deck. “You notice how she didn’t say anything obscene or offensive?” Holden said.

“Did notice that.”

Holden took a deep breath. “That can’t be good.”

The meeting room was near the moon’s surface, and it was built like a classroom or a church: a podium at the front and rows of chairs before it, but the podium was empty and a dozen of the chairs had been pushed into a rough circle. Avasarala sat with Fred Johnson—the head of Tycho Station and once a spokesman of the OPA—and Martian Prime Minister Smith to her left and Bobbie Draper to her right. Both Smith and Johnson were in their shirtsleeves, and all of them looked tired. Holden, Naomi, Alex, and Amos sat together in a group across from them, a couple of chairs marking the border on either side. Holden didn’t realize until they’d all sat down that Clarissa hadn’t come. He hadn’t even considered bringing her. This was a

meeting of the *Rocinante*'s crew, after all, and she was ...

Avasarala tapped her hand terminal. A schematic popped into place in the space in the center of the circle. Earth, Luna, the Lagrange stations were all glowing gold. The naval ships that formed the blockade that intercepted and destroyed the Free Navy's follow-up attacks were in green. A separate model showed the inner system—Sol, Mercury, Venus, Earth, Mars, and the major Belt stations like Ceres and Pallas—with a scattering of red dots like the lesions of a rash.

"The red's Free Navy," Avasarala said. In person, her voice sounded raspy, like she'd been coughing. Holden couldn't tell if she'd only been talking too much or if she'd been breathing in Lunar fines: dust too small to be stopped even by the best filters and that still made the station air stink of gunpowder. "We've been tracking their movements. There's an anomaly. This one."

She prodded her hand terminal, and the two displays merged, one expanding, the other shrinking, until they showed the same stretch of space. The red dot stood off apart from the stations and planets, floating in a vast emptiness where the orbital mechanics left it mostly alone. Naomi leaned forward, fighting to keep her eyes focused. She was too tired for this.

"What's that doing out there?" Naomi asked, and her voice was clear enough.

"Spotting," Fred said. "Its transponder's off, but it appears to be a prospecting ship. The *Azure Dragon* out of Ceres. It's crewed by radical OPA."

"Meaning now maybe with the Free Navy. The rocks they've been throwing?" Holden said.

"Coordinated by that little fucker there," Avasarala said. And then, with an exhausted shrug, "We think. What we know is this: As long as those pigfuckers can keep throwing rocks at us, we're pinned. Our ships don't dare move, and Marco Inaros can claim whatever the hell he wants in the outer planets."

Smith leaned forward, speaking with his calm, almost apologetic tone. "If Chrisjen's intelligence service is right and this ship is guiding the attacks, this is a critical target against the Free Navy. You know that Colonel Johnson, Secretary-General Avasarala, and I have been forming a joint task force? This will be their first field operation. Capture or destroy

the *Azure Dragon* and reduce the ability of the enemy to launch assaults against Earth. Give some damn breathing room to the combined fleet.” It was the first time Holden had heard the term *combined fleet*, and he liked the way it sounded.

He wasn’t the only one.

“Shit,” Amos said. “And here I was enjoying being so absolutely thumb-up-the-ass useless.”

“You want a little ass-play, that’s your business,” Avasarala said. “Only you can do it in a crash couch. The *Rocinante* isn’t part of the fleet, so losing it won’t leave a hole in our defenses. And I understand you’ve got a few after-market add-ons—”

“Keel-mounted rail gun,” Alex said with a grin.

“—that scream of overcompensating for tiny, tiny penises, but might prove useful. The mission commander has requested you and your ship, and honestly none of you are worth a wet slap at this point except Miss Nagata anyway, so—”

“Wait,” Holden said. “The *mission commander*? No.”

Avasarala met his gaze, and her expression was hard as granite. “No?”

Holden didn’t flinch. “The *Rocinante* doesn’t go under anyone’s command but ours. I understand that this is a big joint task force and we’re all in everything together. But the *Roci* isn’t just a ship, it’s our home. If you want to hire us, fine. We’ll take the job, and we’ll get it done. If you want to put a commander in place and expect us to follow their orders, then the answer’s no.”

“Captain Holden—” Avasarala began.

“This isn’t a negotiation. This is just how it’s going to be,” Holden said.

Three of the most powerful people in the solar system, the heads of the central factions that had struggled against each other for generations, looked at each other. Smith’s eyebrows rode high on his forehead and he looked anxiously around the room. Fred leaned forward, staring at Holden like he was disappointed in him. Only Avasarala had a glint of amusement in her eyes. Holden glanced at his crew. Naomi’s arms were crossed. Alex’s head was lifted, his chin pushed forward. Amos was smiling exactly the way he always did. A unified front.

Bobbie cleared her throat. “It’s me.”

“What now?” Holden said.

“It’s me,” Bobbie repeated. “I’m the mission commander. But if you really don’t—”

“Oh,” Holden said. “No. No, that’s different.”

Alex said, “Yeah,” and Naomi uncrossed her arms. Bobbie relaxed.

“Should have said so in the first place, Chrissy,” Amos said.

“Go fuck yourself, Burton. I was getting to it.”

“So, Bobbie,” Holden said. “How do you want to do this?”

Chapter Four: Salis

Wait wait wait!” Salis shouted into his suit radio. The base of the rail gun was ten meters across, built in a rough hexagon, and massing more than a small ship. At his words, a half dozen construction thrusters along the great beast’s side fired off, jetting ejection mass into the void. The calibration meter on Salis’ mech cycled down to zero; the hairbreadth movement of the great beast stopped. They floated together—inhumanly large weapon, softly glowing alien station, and Salis in his spiderlike safety-yellow construction mech.

“A que, coyo?” Jakulski, their tech supervisor, asked in his ear.

“Reading drift,” Salis said, playing his ranging lasers over the rail gun and the socket mount it was meant to lock into. It had been hard work, fitting the alien station with the three wide belts of ceramic, carbon-silicate lace, and steel. Now it looked like a vast blue ball with rubber bands around it, each at right angles to the other two. And where the lines crossed, rail gun turrets squatted. It had turned out it was impossible to drill into the alien station. Welding didn’t work, because the surface wouldn’t melt. Wrapping the whole damn thing up had been the only viable alternative for attaching things to it.

“Que mas que?” Jakulski asked.

“Shift one minute ten seconds relative z, minus eight seconds relative y.”

“Savvy,” Jakulski said. The construction thrusters along the length of the rail gun stuttered, impulse and counterimpulse. All around them, the gates dotted the sky with only a little over thirteen hundred bright spots, barren and empty and threateningly regular. Medina Station itself was the only other object, and it was far enough away that Salis could have covered the whole structure—drum, drive, and command—with his outstretched thumb. The slow zone, they still called it. Even though the weird limit on speed had been lifted, the name was the name, and it carried a sense of strangeness

and doom with it. Most of his work was inside Medina. Heading out into the vacuum was a rare thing, and now he was here he didn't like it much. He kept turning away from the job to look out into the black. It had been almost the end of his first week on the job before he realized he was looking for the Milky Way, and that he kept looking because it wasn't there.

"Bist bien?" Jakulski asked.

"Moment," Salis said, checking the ranging lasers again. He glanced up the length of the great barrel while the mech struggled again to get a fix on the thing's skin and the socket. The few rail guns he'd seen before had been made from titanium and ceramic. These new materials Duarte was sending through the Laconia gate were bleeding-edge, though. It wasn't only the iridescence of the carbon-silicate lace plating. The power cores that ran the guns and the frictionless ammunition feeds that supplied them were ... strange.

The designs were elegant, sure. But they were just magnetic rails powered by fusion cores same as any ship's. And they did what they needed to do, but there was something off about the way they came together, a sense of being not manufactured so much as tested for. A kind of awkwardness and beauty that made Salis think of plants more than machines. It wasn't only the new materials that went into them. Ever since the ring gate lifted itself off Venus, there had been bits of new one thing and another. It was the scale of it. And maybe something else.

The ranging lasers reported back.

"Bien," Salis said. "Bring the bastard home."

Jakulski didn't reply, but the thrusters fired. Salis kept painting socket and rail gun alike, making manual reading after manual reading. It was the sort of thing he usually left to the mech's system, but the new materials sometimes caused the laser to throw false errors. And it was better to be certain. The station had been still as stone in the years since the gates had opened. Didn't mean ramming a great damned machine into it wouldn't provoke a response.

It took the better part of a shift to bring the massive thing in, but eventually it locked into place. The turret settled, absorbed what little momentum was left in it. The socket closed around it, leaving Salis with the uncomfortable image of gigantic lips closing very slowly around a huge straw.

“Pulling back,” Salis said.

“Clar à test, you?”

“Moment,” Salis said, pushing off from the station. He floated out into the emptiness to where Roberts and Vandercaust waited, strapped into their own mechs. The mech’s attitude thruster brought him to a relative stop at their side and turned him back to look at their work. On the group channel, Roberts grunted.

“Vise ca bâcter,” she said. It was true enough. With the guns strapped at the top and bottom of all three axes, the station *did* look a little like something seen through a microscope. A macrovirus, maybe. Or a minimalist streptococcus.

“In place,” Salis said. “Clar à test.”

“Three,” Jakulski said, “two, *one*.”

The rail gun beneath them shifted in its socket like something waking from sleep. For a moment, it seemed to drift like a reed caught in a current of aether. Then it snapped into place, jittering from one position to the next too quickly for Salis’ eyes to see the motion between, faster than the twitch of an insect’s leg. It cycled through, taking aim on each of the gates in its field of vision. With the layout they had, at least two of the guns would be able to sight every gate, and most gates fell in the arc of three. Salis had seen pictures of old fortifications overlooking the sea back on Earth. They’d never made sense to him before—too flat to apply to his own experience—but this was the same thing. The high guns that would protect Medina Station from invading ships forever. He felt some emotion stirring in his chest, and it could have been pride or dread.

“Bien,” Jakulski said. He sounded almost surprised. Like he’d expected the gun to rip itself loose and spin out into the nothing sky. “Pull back for live fire.”

“Pulling back, us,” Vandercaust said. “Don’t put a round through us, sa sa?”

“I do, and you let me know, eh?” Jakulski laughed. Easy for him. Not like he was out here. And then, not like the guns couldn’t turn Medina to chaff too. Salis and the others pulled back fifty klicks, flipped, and decelerated for another fifty. The darkness was unnerving. Back on the other side of the gate, it was never this dark. There was always the sun and the stars.

“Stopped and stable,” Roberts said. “Hast du dui painted friendly?”

“Do. It shoots you, that’ll mean something’s wrong. Setting target,” Jakulski said, and Salis upped the magnification on his mech. There, in false-color readout, was the alien station. This far out, he could see three of the six guns. “Sensor arrays bist bien. Firing in three, two, one ...”

A puff of vapor spat out the tip of the gun—charged gas making a brief extension to the barrel and putting a little more speed into the round. Salis’ mech shuddered, the magnetic spill from the rails affecting his systems even this far out. He didn’t see the rounds the rail gun fired. In the time it took for the harsh feedback tick to go from his radio to his ear, the tungsten slug was already through the target gate. Or out into the weird non-space between them. In the false-color display, a ripple passed through the alien station like what he’d see in a sphere of floating water when one part of it got touched. The ripple died out before it even circled the station once.

“La que vist?” Jakulski asked.

“Nothing,” Salis said. “It looks fine. Tu?”

“Station glow only thing,” Jakulski said. In all of their tests, the only reaction the station ever had to being pushed by the rail gun shots was a shower of photons.

“Nothing else?”

“Nope.”

“Drift?”

“No drift.”

It was what they wanted to see. The rail guns were big enough, powerful enough, that even keel-mounted on a ship, firing them would have been difficult. Mounted on turrets like they were, they should have been as much thruster as weapon, driving themselves away from whatever they were shooting at fast enough that they’d be hard to catch.

Except the station.

Whatever the aliens did to shrug off equal and opposite reactions, it only generated enough energy to throw a little light, and it didn’t seem to bring any kind of countermeasures against them. Still, Salis wasn’t exactly looking forward to heading back and checking the sockets and bases.

“You hear Casil talk?” Vandercaust said. “About why it don’t move when we push it?”

“No,” said Roberts.

“Said it does, but the ring space moves with it, so we can’t see it happening.”

“Casil’s crazy.”

“Sí ai.”

“Sending us back in?” Salis asked into his radio.

“Moment,” Jakulski said, and then, “Bien. Cleared, you. Keep tus augen wide, anything not right.”

Not right meaning cracks in the housings, meaning leakage of the fluid tanks, meaning failures in the reactors or the ammunition feeds.

Meaning the eyes of an ancient god looking at them. Or something worse.

“Savvy,” Salis said, checking his thrusters. “Going in.”

The three mech drivers shifted and launched themselves back toward the station. Medina floated to his right: the still drive cone, the turning drum. Salis looked out past it like he was searching for a familiar face, but the stars still weren’t there.

The internal drum section of Medina Station had a straight-line sun that burned at the center of rotation from the command center all the way down to the engineering decks. The full-spectrum light from it came down on the curved farmland and the wide, bent lake that had once been meant to carry a city of Mormon faithful to the stars. Salis sat in an open-air bar with Vandercaust and Roberts, drinking beer and eating white kibble that tasted of cheese powder and mushroom. Behind and before him, the landscape curved up to lose itself in the sun’s bright line. To his left and right, the full length of the drum spinning at about the g of Luna. The gentle breeze that breathed against the back of his neck came from spinward, same as it ever did.

When he’d been a boy, Salis had seen the Big Room caverns on Iapetus. He’d walked under the false skies on Ceres. The drum at Medina was the nearest thing he could imagine to sitting on Earth as it had been before the rocks came down: unregulated atmosphere above him and the thin crust and mantle holding him above the core of molten stone. No matter how many

times he came here, it felt exotic.

“Flyers up again,” Roberts said, squinting up into the light. Salis looked up. There, almost silhouetted by the brightness, five bodies floated in the air, arms and legs outstretched. They seemed to be flying from behind Salis, curving up ahead like the fields of soybean and maize, but the truth was they were the bodies at rest. About five months before, some adolescent idiot had figured out how to lay down a temporary track that could accelerate people anti-spinward to match the drum’s rotation and let them launch themselves up, weightless in the air. So long as no one got too near the artificial sun or failed to match the drum’s acceleration before they came back down, it was supposed to be good fun.

Two streaks of vapor reached out from the engineering decks toward them, and Salis pointed toward them. “Security got them, yeah.”

Vandercaust shook his shaggy gray head. “Ton muertas.”

“Young and stupid. But it’s what the Roman said: *Fihi m’fihi*,” Roberts said. Her voice had more sympathy, but she was also nearer the age of the illegal flyers. “You born stone and sober, que?”

“Born with respect,” Vandercaust said. “*My shit only kills me.*”

Roberts’ shrug was a surrender. On ships—real ships—back on the right side of the gates, keeping the environment safe was always the first thing. Double-check what had already been double-checked, clean what was already cleaned. Playing fast and loose was a quick way to die, and your family and crew along with you. There was something about the big stations—Ceres, Hygeia, Ganymede, and now Medina—that gave kids license to be dumb. Reckless.

Stability, Salis thought. Having a room as massive as the drum did something to people’s heads. He felt it too; it seemed too big to break. Didn’t matter that nothing was really that big. Anything could get broken. *Earth* got broken. Acting like risks weren’t risks put all of them in danger.

Even so, there was part of him that was sorry to see the security crew lock down the flyers. Kids being kids. There should be a place for that somewhere. Martians had that. Earthers had that. It was only the Belters who’d spent too many generations dying for their first fuckup to let their kids play sometimes.

He squinted into the brightness. The security and the flyers were heading down to the surface now, foggy trails of their suit thrusters making

wide, slow spirals centered on the bright line of sun as they came down.

“Too bad,” he said. Vandercaust grunted.

“You hear about the gang showers in F-section?” Roberts said. “Blocked up *again*.”

“Alles designed con full g,” Vandercaust said. “Same thing with the farms. Fields aren’t draining like they should. Spin the drum up the way los Mormons meant, it’d work.”

Roberts laughed. “It would, we wouldn’t. All smashed flat, us.”

“Better to change it,” Vandercaust said around a bite of kibble.

“We do enough, it’ll work,” Salis said. “Ship with this much redundancy? If we can’t make it right, we don’t deserve it.”

He drank the last of his beer and stood, lifting a hand to ask if either of his crewmates wanted another. Vandercaust did. Roberts didn’t. Salis stepped across the dirt to the bar. That was part of it, he decided. The plants and the false sun and the breeze that smelled of leaves and rot and fresh growth. Medina’s drum was the only place he’d ever lived where he could walk on soil. Not just dirt and dust—those were everywhere—but *soil*. Salis didn’t know why that was different, but it was.

The man at the bar swapped out Salis’ bulb for a fresh, and a second besides for Vandercaust. When he got back to their table, the conversation had moved on from the flyers to the colonies. Wasn’t that big a shift. From people taking stupid risks to people taking stupid risks.

“Aldo says there was another bunch of threats coming out of the Jerusalem gate,” Roberts said. “We send their reactor core, or they come get it.”

“Surprise them if they do,” Vandercaust said, taking the fresh bulb from Salis. “Guns up, and it’s past time for alles la.”

“Maybe,” Roberts said, then coughed. “Maybe we should give it to them, yeah?”

Vandercaust scowled. “For for?”

“They need and we have is all,” Roberts said.

Vandercaust made a dismissive wave of his hand. *Who gives a shit what they need?* But something in Roberts’ voice caught Salis’ attention. Like she’d said more than she’d said. He met her dark eyes and lifted his chin as a question. The words she was trying to say pushed her head forward like a nod.

“Can help if we want. Might as well, sí no? No reason no, since we’re not what we were anymore, us,” she said. Vandercaust scowled, but Roberts went on. “We did it. Us. Today.”

“Que done que, us?” Vandercaust said. His voice was rough, but if Roberts heard it, she didn’t stop. Her eyes glittered like she was about to cry. When she spoke, it was like water coming out a snapped pipe. Her voice gushed and pulsed and gushed again.

“Always, it’s been when we find place. Ceres o Pallas o the big Lagranges never got built. Mi tía talked about making a station for all Belters alles. Capitol city à te void. It’s this. Belters built it. Belters live in it. Belters gave it power. Y because of guns we put in, it’s ours forever. We made this place home today. Not just our home, ours. *All* of ours. *Esá es homeland* now. Because of us three.”

Tears dripped down her cheeks, slow in the sixth g. Joy lit her from inside like a fire, and it left Salis embarrassed. Seeing Roberts like this was like walking in on someone pissing—intimate and wrong. But when he looked away, the drum spread out around them. The plants, the soil, the land above him squinting down at him like a sky.

He’d been on Medina for fifteen months. Longer than he’d ever been on a station in his life. He’d come because Marco Inaros and the Free Navy needed people here. He hadn’t thought about what it meant, except he’d known in his gut he was more OPA than the OPA, and that was what Free Navy meant. Now, maybe, he caught a glimpse of what it was behind that. Not a war forever. A place.

“Homeland,” he said, speaking carefully. Like the word was made from glass, and could cut him if he said it too hard. “Because the rail guns.”

“Because something’s ours,” Roberts said. “And because now they can’t take it away.”

Salis felt something in his chest, and he let his mind poke at it. Pride, he decided. It was pride. He tried a smile and turned it to Roberts, who was grinning back. She was right. This was the place. Their place. Whatever else happened, they’d have Medina.

Vandercaust shrugged, took a long pull from his bulb, and belched. “Besse for us,” he said. “But here’s for that? They ever do take it away, we sure as *shit* never get it back again.”

OceanofPDF.com

Chapter Five: Pa

I don't trust anything about this," Michio Pa said.

Josep yawned and propped himself up on one elbow, looking down at her. He was a beautiful man in a slightly ruined way. He wore his hair longer than a crew cut, shorter than his shoulders. The gray in it still only a highlight in the black. Decades had roughened his skin, and the ink there told the story of his life: the neck tattoo of the OPA's split circle that had been covered over later to make the upraised fist of a radical collective long since collapsed. The elaborate cross on his shoulder, inscribed in a moment of faith and kept after that faith had crumbled. Phrases written along his wrists and down his side—*No more water, the fire next time* and *To love someone is to see them as God intended them* and *Ölüm y chuma pas pas fóvos*—spoke of the various men he had been in his life. His incarnations. That was part of why Pa felt so close to him. She was younger than him by almost a decade, but she'd been through incarnations too.

"Which 'this'?" he asked. "There's so many things not to trust."

"Inaros calling in the clans," she said, rolling over and gathering a blanket with her as she did. It wasn't that she was uncomfortable naked, only now that their coupling was done, she was ready to go back to their more formal roles. Or something closer to them. Josep noted it and without comment went from being one of her husbands to her chief engineer. He crossed his arms and leaned against the wall.

"Is it the meeting or the man?" he asked.

"Any of it," she said. "Something's not right."

"You say it, and I believe."

"I know. This is the part where I always do this. The coyo in charge changes the plan and I start looking for them to be the next Ashford. The next Fred fucking Johnson. It's my pattern."

"Is. Doesn't mean your pattern doesn't match. What's in your head?"

Pa leaned forward, chewing her lip. She could feel the thoughts bumping around like blind fish, searching for the words that would give them form. Josep waited.

By the terms of their ketubah, the marriage group was seven people: her and Josep, Nadia, Bertold, Laura, Evans, and Oksana. They had all kept their own surnames, and they made the *Connaught's* permanent crew. The others who served under her came and went, respected that she was captain, that her orders were fair, and that she didn't show any overt favoritism to her spouses, but there was the understanding always that the core of the ship was her family, and no threat to it would be tolerated. The idea of separating family from crew was an inner-planets thing, one example of the unconscious prejudice that made Earthers and Martians treat life aboard ships as somehow different from real life.

For them, the rules changed when the airlock closed, even if they didn't know themselves well enough to see it. For Belters, there was no division. The Doctrine of the One Ship, she'd heard it called. That there was only one ship, and it had countless parts as a single body had countless cells. The *Connaught* was one part, as were all the ragtag ships under her command: *Panshin*, *Solano*, *Witch of Endor*, *Serrio Mal*, and a dozen more. And her fleet was only part of the Free Navy: a vast organism that passed information between its cells with tightbeam and radio, that consumed food and fuel, that worked its own slow destiny among the planets like a massive fish in the greater sea of the sky.

By some interpretations, even the Earther and Martian ships were part of the same one-ship, but for her, that always ran into conversations about cancers and autoimmune disorders, and the metaphor failed.

Still, there was a reason she was thinking of it now.

"We aren't coordinated," she said, trying out the words as she said them. "When you push off with a foot, you reach out with a hand. One movement. We aren't like that. Inaros and military. Sanjrani and the finances. Rosenfeld and his production and design. Us. We're not the same thing yet."

"We're new at this," Josep said. The words could have been a refutation, a way to explain away her unease. From him, it was an offering. Something to react to that would help her mind come clearer.

"Maybe," she said. "Hard to say. May be we're supposed to be puppets

and the strings all run to the *Pella*. Himself changes his mind, and we all jump.”

Josep shrugged, his warm eyes narrow. “He’s delivered. Ships, fuel, ammunition, drives. Freedom. He’s done what he said he’d do.” She could feel the gentle provocation in his words, and it was what she needed.

“He’s done what he says he said. His real record’s not so good. Johnson’s alive. Smith’s alive. Ganymede’s only gone neutral. We’re still throwing rocks at Earth and no surrender’s coming from them anytime soon. Go back and look at everything he promised, and it’s not what’s on the plate.”

“Politicians since immer and always, that. Still more than anyone else has done for the Belt. Inners are on their heels now. And with the *Hornblower* and ships like her, we’ll have stockpiles to last years. That’s our part. Keep everyone with food and air and supplies. Give us a chance to make the Belt without a boot on our necks.”

Pa sighed and scratched her knee—her nails against her skin with sound as soft and dry as sand. The air recycler clicked and hummed. The drive that pressed them both down toward the deck throbbed.

“Yeah,” she said.

“But?”

“But,” she said, and left it at that. Her unease didn’t find any further words that fit. Maybe they’d come in time or maybe she’d come to peace without having to speak them.

Josep shifted his weight and nodded toward the crash couch. “You want me to stay?”

Pa considered. It might have been a kindness to say yes, but the truth was whoever she shared her body with, she slept better alone. Josep’s smile meant he’d heard her answer anyway. It was part of what she loved about him. He stepped forward, kissed her on the forehead where her hairline met the skin, and started pulling on his jumpsuit. “Tea, maybe?”

“I don’t think so,” she said.

“You should,” Josep said. It was more than he usually did.

“All right.” She shrugged off the blanket, cleaned up, and put her own clothes on too. When they stepped out into the Martian gunship’s galley, she leaned against him. None of the other crew were there, after all. Just Oksana and Laura finishing bowls of mushroom and sauce. Just family.

Josep angled toward a different bench, and she let him set them a little apart from their wives. Oksana laughed at something. Laura said something acid and cutting, but she said it without any heat. Pa didn't catch the words.

Josep pulled bulbs of tea for them both and then sat in companionable silence. She sipped, and the astringent bite of the tea mixed with the aftermath of sex to settle her without her even knowing she'd been unsettled. When she sighed, Josep raised his eyebrows.

"Yes," Pa said. "You're very smart. This is what I wanted."

He sketched a bow, and then sobered. "Thinking about what you said? About coordinated?"

"Don't worry," she said, but he went on.

"You've been betrayed by men who were supposed to be your leaders. Johnson when we were OPA. Ashford on the *Behemoth*. Okulski with the union. We went independent *because*, yeah? Only now we're not independent. Now we're Free Navy, because Inaros convinced us to. Not just you. *Us*."

"You're right," Pa said. "I'm probably just pushing back on what already happened. I should let go of it."

"Shouldn't let go of being educated," he said. "Universe spent a lot of time telling you something. Now you're second-guessing it. Maybe all those other things were getting you ready for this."

Something in Pa's chest slipped a little tighter. "You don't trust him either."

"Me? You don't want to judge anything by me. I don't even trust God."

"You are absolutely the worst mystic ever," Pa said, but she said it laughing.

"I know," Josep said, shaking his head. "Sad failure of a prophet, me. But"—he lifted a finger—"I know you. And I know you're the kind that likes to pretend she doesn't know things she knows so that there won't be friction. So if you're thinking maybe you're wrong so things are okay, you better check again, make sure things are okay. The universe needs a knife, then it makes a knife. And no one sharper, you."

"And if it turns out the universe is just a bunch of chemicals and energy bashing against each other until the light runs out?"

"Then pattern-matching's still a good way to not get bashed," he said. "You tell me if Himself matches the pattern. You've seen more than I

have.”

“Doubt that,” she said, but she took his hand. He held hers. After a moment, Laura came over to sit with them, and then Oksana. The talk turned to less dangerous subjects—all the ways Martian design was worse than Belter, the latest news from *Witch of Endor*’s capture of yet another colony ship, Carmondy’s report from the overhaul of the *Hornblower*. The business of running the *Connaught*. But the little knot sat just under her ribs, reminding her that something was wrong.

When she went back to her cabin, she went alone. She fell into the crash couch, pulled the blanket over her head, and dreamed of a huge, fragile creature swimming through the currents of the deep ocean, only the sea was made of stars, and the animal was built from ships, and one of them was hers.

Nothing as big as a revolution can survive with only one account of it. The rise of Ceres Station—or its fall, according to the inners—was the precursor to Marco Inaros and the Free Navy. Looking back, the death of a water hauler seemed a pathetically small thing to have set Earth and Mars against each other, even for just a little time, but it had been enough. With the traditional oppressors of the Belt pointing guns at each other for a change, the OPA had stepped in, taken control of the port city of the asteroid belt.

No one back then had expected it to last. Sooner or later, Mars and Earth would get their feet back under them, and then Ceres would fall. Anderson Dawes, the de facto governor of the station, would lose the power he’d grabbed and either move on to some new scheme or live on in spirit, a martyr to the cause. Every autonomous space was temporary.

Only the fall never came.

The collapse of Ganymede and the exposure of the Mao-Kwikowski protomolecule program captured the attention of the powers that be. Then Venus hatched out the great and mysterious structures that made the first gate. By the time the *Behemoth* accompanied the combined forces of Earth and Mars to explore the gate and consider its vast and complex implications, Anderson Dawes had woven a web of relationships.

Corporations on Luna and Mars, the Lagrange stations, the Belt, the Jovian moons—none of them could allow trade to stop for the years it might take to reconquer the port. In the way of humankind since before the first contract was pressed into Sumerian clay, the temporary accommodations lasted long enough to become invisible.

And when the gates *beyond* the gate opened and the flood of humanity lurched out toward the new planets and suns, there were powers and money with interests in keeping Ceres as it was. And Anderson Dawes had known which palms to grease and when to compromise in order to keep the port's traffic flowing uninterrupted.

Through long, careful management the great negotiator had outlasted his status as a rebel and become instead a politician. Dawes became respectable, and Ceres Station became first city of the Belters just in time for it not to matter.

And then the Free Navy had come and kicked the whole carefully built sandcastle into the waves. And Dawes, like any politician, had considered the players and the powers, the chances and the certainties. The story of the rise of Ceres Station, instead of a triumph of opportunism and political deftness, became the precursor of the Free Navy. Dawes embraced this new version of himself and his station. He'd chosen his side, just the same as she'd done.

He stood in the dock now, waiting for her to cross over from the *Connaught*. The spin gravity of the station locked her ship in its clamps. Even if the power failed, momentum would keep the ships from dropping out into the black. Pa still didn't like leaving her ship behind. It felt like an unnecessary risk.

"Michio," Dawes said, taking her by the hand and beaming. "It's good to see you in the flesh."

"You too," she said. It wasn't true. Dawes had spent too many years allied too closely with Fred Johnson to ever have the stink entirely washed away. But he was a necessary evil, and on good days probably did more to help the Belt than to compromise it. He gestured toward an electric cart with two police guards in light armor.

"Am I under arrest?" Pa asked, keeping her voice light and amused.

Dawes chuckled as they walked. "Ever since the rocks fell, the security's been tighter," he said. His acne-scarred cheeks tightened and a darkness

came into his expression. “There are millions of people living on Ceres. Not all of them are comfortable with all that’s happened.”

“Have there been problems?” Pa asked as they reached the cart.

“There are always problems,” Dawes said, then after a brief hesitation, “but there have been more of them.”

The cart lurched, turned toward a wide ramp leading up into the station. The mildly adhesive wheels made a sound between a hiss and crackling as they rolled away from the docks. Pa looked back toward the *Connaught*’s berth. Maybe she should have brought guards of her own with her. Carmondy’s men were still all back on the *Hornblower*, but Bertold and Nadia were both combat trained. Too late now.

The administration levels were out nearest the skin of the station where the Coriolis was least pronounced. The old tunnels and corridors had been redone since the OPA claimed the station, but there was still a sense of age. Dawes made small, inane conversation intended to put her at ease, and his skill was such that it worked. If they were really talking about which restaurants made the best sausage and black sauce and what had happened when a religious convocation was booked in the same halls as a raï music festival, the situation couldn’t be that dangerous. She knew it was an illusion, but she appreciated it all the same. Neither of them mentioned the reason they were there. Inaros’ name didn’t come up.

The meeting itself was in a garden in the administrative level. A wide, arching ceiling glowed with full-spectrum light. Devil’s ivy draped columns and walls, and wide ferns spread massive fronds like herons about to take flight. The air smelled of hydroponic plant food and wine. She heard Sanjrani’s high, reedy voice before she turned the corner. *Without a solid inventory of the fertilizer base on every station, a nitrogen-based currency is going to be swamped by illegal inputs.* Another variation on his constant theme. It was almost good to hear it again. Dawes touched her elbow, gestured down a path between a small fountain and a spiral fern, and then they were there. The five leaders of the Free Navy. Nico Sanjrani, looking more like a middle-aged shopkeeper than the chief economist of a budding empire. Rosenfeld Guoliang, with his dark, pebbled skin and his too-ready smile, general of the second fleet and industrial czar. And sitting in a chair of woven cane, Marco Inaros, the man behind it all.

Victory suited him. His hair flowed down to his shoulders, and he held

his body with an animal ease. When he rose to greet her and Dawes, she felt an echo of his pleasure in her own heart. Whatever else the man was, he had a charm that could coax the venom out of snakes. It was, she presumed, the gift that had put him in position to trade with the Martians for their ships, their munitions, all the material that allowed them to stage their revolution. The only other person there was Inaros' skinny, crazy-eyed son, Filip. Pa made a point of not looking too closely at the boy. There was something about him that bothered her, and it was easier to stay aloof than to engage.

"The brilliant Michio Pa!" Marco said. "Excellent! We're all here now. The founders of our nation."

"Do you have stats on the new acquisitions?" Sanjrani asked, either unaware that he was stepping on Marco's moment or at least unconcerned. "I need to get a complete accounting."

"Carmondy's working on that," Pa said.

"Soon, though."

"Nico, my boy," Rosenfeld said. "Don't be an ass. Say hello to Captain Pa first."

Sanjrani scowled at Rosenfeld and then at Inaros, and finally turned back toward her and nodded curtly. "Hello."

"Now that the inner circle's all here," Dawes said, "perhaps we could hear what's brought us all together? Not that being in one room isn't a pleasure in itself, but ..."

Marco smiled as his son, behind him, fidgeted with the holster of his pistol. "We've broken Earth and beaten Mars. Johnson's OPA is shown up as the collaborationist sham that it was. Everything we set out to do, we've done. It's time to begin the third phase."

Everything we set out to do except kill Smith and Fred Johnson, Pa thought but didn't say. The silence from the others wasn't about that, though.

When Dawes spoke, his voice was carefully light and conversational. "I didn't know you had a third phase in mind."

Marco's grin could have been anger or pleasure, rage or satisfaction. "Now you do," he said.

Chapter Six: Holden

I feel like we should be whispering,” Holden said. “Going around on tiptoes.”

“We’re on the float,” Naomi said.

“Metaphorical tiptoes.”

The ops deck was dark apart from the backslash glow of their monitors. Alex was sleeping in his cabin, leaving the monitoring to Holden and Naomi. Last he’d seen them, Bobbie and Amos were touring the ship, testing everything but the comms—PDCs, thrusters, the keel-mounted rail gun, the environmental systems. Ever since the mission had begun, Bobbie had been careful not to make Holden feel like she was taking over the ship, but her deference didn’t extend so far that she wouldn’t refamiliarize herself with every centimeter of the *Roci* before the fighting started. Even if it was just running through how Amos had rerouted the water feeds to the galley, watching the two of them always felt like listening to a conversation about weapons. The serious, professional talk between people who understood that they were working with equipment that could get people killed. It left him feeling like he’d been a little too casual about the ship up to now.

Clarissa ... he didn’t know where Clarissa was. Ever since the last hard burn, he’d only caught fleeting glimpses of her, like she was a spirit they’d picked up that couldn’t bear being seen straight on. Most of what he heard about her—that she was building up her strength, that her black market implants were making her less nauseated, that she’d tracked down the bad coupler that was making the machine shop lights dim—he heard from the others in the crew. He didn’t like it, but at least he didn’t have to talk to her.

The plan was simple. The *Azure Dragon* wasn’t a gunship, but a geological surveyor. The protection she had was that space was vast, the ship was small, and her orbit kept her far enough away from Earth and Luna that she could burn hard back out to the Belt or the Jovian moons if anyone

started coming for her. All of her active systems—transponder, radar, ladar, radio—were shut down to keep her from announcing herself. She couldn't stop the light from bouncing off her hull, and she couldn't hide her waste heat, but she could run as quietly as possible. It limited her to passive sensors and tightbeam. Enough for her to do the work of coordinating the stones thrown at Earth, but still half-blind.

And that was what Bobbie was counting on.

They'd laid in a course that would put them close to the *Azure Dragon*, then arranged for a shifting of the combined fleet that would hide the flare of their burn. It was a balance of getting to the enemy quickly but not being able to make the classic halfway-point flip-and-burn. They only built up enough velocity that they could shed it when they got close, and then the *Roci* went dark and drifted. With no active sensors, the *Azure Dragon* would have to see them visually—a tiny point in the vastness—and identify them as a threat without radar or ladar.

And they would, eventually. But by then, if it all went the way Bobbie intended, it wouldn't make a difference.

It was a slower approach than Holden remembered making to anything in all the time they'd had the *Roci*, and it left him antsy and impatient.

The voices came from the lift: Bobbie serious, sharp, and professional; Amos cheerful and amiable. They floated up into the deck, first Bobbie and then Amos. Bobbie grabbed a handhold and pulled herself to a stop. Amos tapped the deck with his ankle as he passed it and killed his own momentum by planting his feet on the ceiling and absorbing it with his knees. He floated upside down. The *Roci* usually ran at less than full g to conserve reaction mass and for Naomi's benefit, but they almost always had a consistent down. Going totally on the float was weird.

"How's it going?" Bobbie asked.

Holden gestured at his screen. "Nothing new. It doesn't look like they've noticed us yet."

"Their reactors are still down?"

"The heat signature's just sitting there."

Bobbie pressed her lips together and nodded. "That's not going to last much longer."

"We could shoot 'em," Amos said. "It ain't my call, but in my experience the guy that throws the first punch usually wins."

“Show me the estimated range,” Bobbie said. Holden pulled up the passive sensor array. At roughly five million clicks out, the *Azure Dragon* was about ten times as far from them as Luna was from Earth. It probably wouldn’t crew more than a dozen people. In the infinite star field, it would have been invisible to the naked eye. Even if the enemy had been on a full burn, the exhaust plume would have only been one point of light among billions. “How accurate is that?”

“I’m not sure,” Holden said. “Normally we’d be using ladar.”

“Give it ten percent either way,” Naomi said. “At this range and scale, passive sampling errors expand pretty fast.”

“But with the ladar?” Bobbie asked.

“Within a meter,” Naomi said.

“You ever think about how much ammo’s flying around out there?” Amos said, reaching up to brush the floor with outstretched fingers. The contact started him drifting almost imperceptibly toward the ceiling and at the same time rotating back toward consensus upright. “Figure all those PDC rounds that didn’t actually hit something; most of the rail-gun rounds, whether they went through a ship or not. All out there someplace going at the same speed as when they left the barrel.”

“If we shoot them, they’ll still look for who did it,” Naomi said.

“Might not,” Amos said.

Naomi looked at Bobbie. “We’re going to have to start a braking burn soon or we’ll skin right past them.”

“How long?” Bobbie asked.

“Three hours,” Naomi said. “Anything more than that, and we’ll need to go on the juice or risk the deceleration g popping a bunch of blood vessels we’d rather keep whole.”

Bobbie tapped the tips of her right middle finger and thumb together in a rapid stutter. When she nodded, it was more to herself than to them. “Screw this. I’m tired of waiting. I’ll go wake Alex up. Let’s get it over with.”

“All right, boys and girls,” Alex drawled. “Everybody strapped in and ready?”

“Check,” Holden said on the open channel, and then listened as the others reported in. Including Clarissa Mao. It was an illusion built from anticipation, but Holden felt like the lights were a little brighter, as if after weeks in dock, the *Roci* was excited to be doing something important too.

“Reactor’s good,” Amos reported from the machine deck.

Alex cleared his throat. “All right. We’re good to go in ten ... nine ...”

“She’s seen us,” Naomi said. “I’ve got action from her maneuvering thrusters.”

“Fine, then. Three-two-one,” Alex said, and Holden fell back into his crash couch hard. The gel pressed in around him, and the ship rumbled the deep bass of the drive as it spilled off speed. To the *Azure Dragon*, it would be like a bright new star had appeared. A supernova light-years away. Or something less dangerous but much, much closer.

“Ladar’s up,” Naomi said. “And ... I’ve got lock.”

“Is their reactor up?” Holden asked, at the same time that Bobbie said, “Give me fire control.”

Naomi answered both. “Their drive’s cycling up. We probably have half a minute. You have control, Bobbie.”

“Holden,” Bobbie snapped, “please ring the doorbell. Alex, surrender maneuvering to fire control.”

“Done,” Alex said.

Holden switched on the tightbeam. The *Roci* found a lock at once. “*Azure Dragon*, this is the *Rocinante*. You may have heard of us. We are on approach. Surrender—”

Thrust gravity cut out and their crash couches hissed as the ship spun on two axes.

“Surrender at once and prepare for boarding.”

Naomi’s voice was calm and focused. “Enemy reactor is coming up.”

The ship seemed to trip, throwing Holden and Naomi up against their straps. The keel-mounted rail gun pushed the whole ship backward in a solid mathematical relationship to the mass of the two-kilo tungsten round moving at a measurable fraction of *c*. Newton’s third law expressed as violence. Holden’s gut knotted and he tried to lean forward. The long seconds dragged.

Naomi made a small, satisfied sound in the back of her throat. “Okay, their reactor’s shutting down. They’re dumping core. We’re not seeing

nitrogen in the plume. I don't think they've lost air."

"Nice shooting," Amos said on the open channel.

"God damn," Bobbie said as the *Roci* shifted back. "I have missed the hell out of this."

Thrust gravity returned, pushing Holden back as they slowed toward the drifting science ship. It was harder now—a solid two g he could feel in his jaw and the base of his skull.

"Please respond, *Azure Dragon*, or we'll shoot you some more," he said.

"This doesn't feel right," Naomi said.

"They started it," Alex said from above them in the pilot's deck. "Every rock that dropped, they had a part in."

Holden wasn't sure that was what she'd meant, but Naomi didn't press it, so maybe it had been. "Not getting any response, Bobbie," he said. "How do you want to play it?"

In answer, the former Martian marine climbed down from the gunner's station, hand over hand in the high gravity. The muscles in her arms were like cords of wire, and her grimace said both that the sheer effort hurt and that she kind of liked it. "Let them know that if they open up on us, they won't get crash couches on the way to jail," she said, passing down toward the airlock. "I'm just going to slip into something more comfortable."

The crash couches shifted a little as Alex bent their trajectory so they wouldn't melt the *Azure Dragon* to slag in their drive plume. Bobbie grunted and took a new grip on the handholds.

"You know there's a lift, right?" Holden said.

"Where's the fun in that?" Bobbie said as she sank out of sight.

Naomi shifted against the high gravity so that he could see her face. Her smile was complex—discomfort and pleasure and something that looked like foreboding. "So that's what she looks like when she takes herself off the leash."

Shedding the last of their velocity and matching orbit wasn't fast. Holden listened with half an ear while Alex, Amos, and Naomi coordinated with the *Roci*'s systems to bring them alongside. Bobbie chimed in now and again when she wasn't putting her powered armor together and running through its system checks. The greater part of his attention stayed on the enemy. The *Azure Dragon* floated in silence. An expanding cloud of radioactive gas that had been its fusion core slowly dissipated behind it

until it was hardly denser than the surrounding vacuum. No emergency beacon. No announcement of defiance or surrender. No response to his pings and queries. The silence was creepy.

"I don't think we killed them," Holden said. "We probably didn't kill them, did we?"

"Doesn't seem likely," Naomi said, "but I suppose we'll find out. Worst case, we did, and it still makes it easier to keep the rocks from dropping on Earth."

Something in the tone of her voice caught him. Her eyes were on her monitor, but she didn't seem focused. Her mind a million kilometers away.

"Are you all right?"

Naomi blinked, shook her head like she was trying to clear it, and put on a smile that was only a little bit forced. "It's just strange being out here again. And I can't help wondering whether I know anyone on that ship. It's not something I thought about much before."

"Things have changed," Holden said.

"Yeah, you used to be the one with the high profile," she said, and her smile became a degree less forced. "Now I'm the one all the best interrogators want to sit down with."

Alex announced that he had positive lock on the *Azure Dragon's* airlock. Override was coming. Bobbie acknowledged it, said she was prepped for boarding action. She'd be back when the enemy was cleared. It all sounded very military, very Martian. There was an excitement in their voices. Some of it was their fear dressing up in party clothes, but some of it wasn't. For the first time that he could remember, Holden found himself imagining how it would sound in Naomi's ears. Her friends preparing themselves to attack and possibly kill people who'd grown up the way she had. The way that no one else on the *Rocinante* would ever totally understand.

They'd worked on all sides of the confused mess that humanity had made of the Belt and the scattering of colonies beyond it. They'd fought pirates for the OPA. Taken contracts with Earth and Mars and private concerns with their own agendas. Thinking of Naomi now, not only as herself but also as the product of the life she'd lived—the life she was still bringing herself to reveal to him—changed how he saw everything. Even himself.

"We had to stop them," he said.

She turned to him, confusion in her eyes. “Who? These assholes? Of course we did.” A deep clanking sound ran through the ship as the airlocks connected. An alert popped up on Holden’s screen, but he ignored it. Naomi tilted her head as if Holden was a puzzle she hadn’t quite figured out. “Did you think I felt bad for *them*?”

“No,” Holden said. “Or yes, but not exactly. Everyone on that ship thinks they’re doing the right thing too. When they’re throwing rocks at Earth, it’s to ... to protect kids on ships that had to run with too little air or bad filters. Or people who lost their ships because the UN changed the tariff laws.”

“Or because they think it’s fun to kill people,” Naomi said. “Don’t romanticize them just because *some* of the justifications they use are—”

A second clank came, deeper than the first. Naomi’s eyes widened at the same moment Holden felt his gut tighten. It wasn’t a good sound.

“Alex? What was that?”

“I think we got us a little problem, folks.”

“I’m all right,” Bobbie said, and the way she said it made it clear that it was a live issue.

Naomi turned to her monitor, lips pressed thin and tight. “What’ve we got, Alex?”

“Booby trap,” Alex said. “Looks like some kind of magnetic lock from their end. Froze up the works. And Bobbie—”

“I’m stuck between their outer lock and ours,” Bobbie said. “I’m fine. I’m just going to bust my way through and—”

“No,” Naomi said as Holden’s attention flicked to the alert still flashing on his own monitor. “If it’s really bound, you could break both locks. Just sit tight, and let me see what we can do to get you unstuck.”

“Hey,” Holden said. “Anyone know why we just lost a sensor array?” Another alert popped up on his screen. Raw alarm started sounding in his head. “Or that PDC?”

The others were silent for a moment, and then for what felt like hours and was probably five or six seconds, there was only the tap of fingertips on control panels and the chirp of the *Rocinante* reporting back to queries. Even before he had confirmation, he was sure of the answer. The external camera swept the *Roci*’s skin. The *Azure Dragon*, hugged against her, felt like a parasite more than a prisoner. And then a flicker of sparks and a flash

of safety yellow. Holden shifted the camera. Three spiderlike construction mechs squatted midway down the *Roci*'s side, welding torches lit and clawing at the hull.

"They're stripping us," Holden said.

When Alex spoke, his false politeness didn't cover his rage. "I can put on a little burn if you want. Drop them into our drive plume and be done—"

"You'll fold the airlocks together," Holden said, cutting him off. "It'll crush Bobbie to death."

"Yeah," Alex said. "All right. So that's a bad idea."

Holden took control of a PDC and tried to shift its arc far enough down to catch one of the mechs, but they were too close in. A fresh alert popped up. A hardened power conduit was throwing off errors. They were digging deeper into the hull. It wouldn't be long before they could do some real damage. And if they managed to burrow their way between the hulls ...

"What happens if Bobbie breaks the docking tube?" Holden snapped.

"Best case, we can't use it until we get it repaired," Naomi said. "Worst, they rigged their coupling with a secondary trap that kills Bobbie and spills out our air."

"It's all right," Bobbie said. "I can take the risk. Just give me a second to position—"

"No," Holden said. "No, wait. We can find a way out. No one dies. We've got time."

But they didn't have much. A welding torch flared again. When Amos spoke, his voice sounded wrong. Too small, too close. "You know, Cap, we've got another airlock. Cargo bay's right down here by the machine shop."

The penny dropped. Amos sounded different because he was already wearing a vac suit. He was talking through a helmet mic.

"What are you thinking, Amos?"

"Nothing real subtle. Figure we hop outside, kill a few assholes that need killing, patch stuff up when we're done with the first part."

Naomi caught his eye and nodded once. Years together and an uncountable list of crises weathered made a kind of telepathy between them. Naomi would stay and get Bobbie safely out of the trap. Holden would go out with Amos and keep the enemy at bay.

"All right," Holden said, reaching for his restraints. "Prep a suit. I'm on

my way down.”

“I’ll leave you one,” Amos said, “but I think we’ll get a head start without you.”

“Wait,” Holden said. “We?”

“We’re cycling out now,” Clarissa Mao said. “Wish us luck.”

Chapter Seven: Clarissa

Her second year in prison, Clarissa had agreed to participate in a poetry course that the prison chaplain had put together. She hadn't had much hope for anything to come out of it, but it was half an hour every week she could sit in a gray-green room with steel chairs bolted to the floor and half a dozen of her fellow inmates and do something that wasn't watching censored entertainment feeds or sleeping.

It had been a disaster from the start.

Of the men and women who came there each week, only she and the chaplain had been to university. Two of the women were so dosed with antipsychotics that they were barely present at all. One of the men—a serial rapist who'd killed his stepdaughters by torturing them with a chemical stun spray until they stopped breathing—was so taken with a section of Pope's *Essay on Man* that he'd compose hour-long epics in rhyming couplets that didn't quite scan. His favorite subjects were the injustice of a legal system that didn't allow enough for character and his own sexual prowess. And there was a round-faced boy who seemed too young to have done anything deserving a life in the hole who wrote sonnets about gardens and sunlight that were more painful than any of the rest, though for different reasons.

Clarissa's own contributions had been minimal at first. She'd tried some free verse about the possibility of redemption, but she'd read Carlos Pinnani and Anneke Swinehart and HD at her literature tutor's insistence, so she knew her work wasn't good. Worse, she knew why it wasn't good: She didn't really believe her thesis. On the few occasions she considered shifting to a different subject—fathers, regret, grief—it seemed less like catharsis and more like strict reportage. Her life had been squandered, and whether she said it in pentameter or not didn't seem to matter much.

She quit because of the nightmares. She didn't talk about those to anyone, but the medics knew. She might be able to keep the exact content

of the dreams to herself, but the medical monitor logged her heartbeats and the activity in the various parts of her brain. The poetry made them come more often and more vividly. Usually, they were of her digging through something repulsive—shit or rotting meat or something—trying to reach someone buried in it before they ran out of air. When she stopped attending, they faded back. Once a week, say, instead of nightly.

Which wasn't to say that the course hadn't borne fruit. Three weeks after she'd told the chaplain that she didn't want to be part of his little study anymore, she'd woken up in the middle of the night fully rested and alert and calm with a sentence in her head as clear as if she'd just heard it spoken. *I have killed, but I am not a killer because a killer is a monster, and monsters aren't afraid.* She'd never spoken the words aloud. Never written them down. They'd become her words of power, a private prayer too sacred to give form. She went back to them when she needed them.

I have killed, but I am not a killer ...

"We're cycling out now," she said, her mouth dry and sticky, her heart fluttering in her chest.

... because a killer is a monster ...

"Wish us luck."

... and monsters aren't afraid. She cut the transmission, hoisted the recoilless rifle, and nodded to Amos. His grin, half hidden by the curve of his helmet, was boyish and calm. The outer door of the airlock slid soundlessly open on an abyss filled with starlight. Amos took the edge of the airlock, hauling himself forward and then ducking back in case someone was there waiting to shoot. When no one did, he grabbed a handhold and swung himself out, spinning so that the suit's mag boots would land on the ship's skin. She followed less gracefully. And less certain of herself.

The body of the *Rocinante* under her feet, she looked back at the drive cone. The hull of the ship was smooth and hard, studded here and there with blocky PDC mounts, the clustered mouths of thrusters, the black and deep-sighted eyes of sensor arrays. She held her rifle at the ready, finger near the trigger, but not on it the way that the Martian marine had shown her. Trigger discipline, she'd called it. Clarissa wished that she was the one trapped in the airlock and Bobbie Draper could be here instead.

"Moving forward, Peaches. You watch our six."

"Understood," she said, and started walking slowly backward, her boots

grabbing to the ship and then letting go only to grab hold again. It felt like the ship itself was trying to keep her from spinning away into the stars. No enemies popped up as they moved around the curve of the ship, but to her right, the body of the *Azure Dragon* appeared like a whale rising up from the deep. It was so close to the *Roci*, she could have turned off her boots and jumped to it. The light of the sun streaming up from below threw harsh shadows across a hull scarred and flaking in places where too many years of hard radiation had scoured the coatings into a white, fragile glaze. It made the *Roci* seem solid and new by comparison. Something flickered behind her, throwing her shadow and Amos' out before her. She took a slow, stuttering breath. Nothing had attacked them yet.

They were the attackers.

"Well, shit," Amos said, and at once, Naomi's voice was on the common channel.

"What are you seeing, Amos?"

A small window appeared in the corner of Clarissa's helmet, the HUD showing the stretch of hull behind her. The three bright yellow spiders stood in a cloud of sparks. Two were braced against the hull, ready to haul back a section of ceramic and steel, while the third cut it free.

"All right," Naomi said. "They're going to get between the hulls."

"Not if me and Peaches have anything to say about it. Right, Peaches?"

"Right," Clarissa said, and turned to see the enemy with her own eyes. The brightness of the welding torch forced her helmet to dim, protecting her eyes. It was like the three mechs stayed the same, and the stars all around them winked out. There was nothing left but the people who wanted to hurt her and Amos and the darkness.

"You ready?" Amos asked.

"Does it matter?"

"Not a lot. Let's see what we can do before they notice."

Clarissa crouched close to the hull, lifted her rifle, sighted down it. With the magnification on, she could see the human form cradled in the mech—arms, legs, head encased in a suit not so different from her own. She dropped the bright red dot of the sight on the helmet, put her finger on the trigger, and squeezed. The helmet jerked back, like it was startled, and the remaining two mechs turned and pointed yellow steel legs at them.

"Get moving!" Amos shouted as he jumped into the black sky. Clarissa

turned off her mag boots and leaped after him, almost too late. A white line appeared on the hull where she'd been, the bullet gone off behind them before her suit could even warn her it was coming. The suit thrusters kicked on, driving her out and shifting her unpredictably as it avoided the string of bullets she couldn't see except as lines in her HUD.

"Keep 'em busy, Peaches," Amos said. "I'll be right back."

He shot off, angling forward and around the body of the *Azure Dragon*. Clarissa turned, letting the suit push her in the opposite direction, putting the horizon of the *Rocinante* between her and the mechs. Her heart sounded like a ticking in her ears; her body shook. The red dot found the welding mech, and she pulled the trigger, missing with the first round. The second struck, and the mech rocked a little under the unexpected thrust of escaping volatile gas. Her suit threw up an alert, and she thought it was malfunctioning until she looked at her leg and saw the blood there. She'd been shot. It was like a point of intellectual interest.

"Report!" Naomi was shouting. Clarissa meant to say something, but the mechs were scuttling across the *Roci* toward her, and it took all her attention to retreat and return fire.

"I got a boarding party back here, waiting to go," Amos said.

"How many?" Naomi barked.

"Five," Amos said. And then, "Four now. Now three."

The stars were coming back, but they didn't seem as bright as before. The hull was glowing under the light of the sun, now almost directly overhead. The mechs crawled toward her faster, like something out of a nightmare. One scuttled past the barrel of a PDC and vanished.

"Got one," Alex said, and Clarissa laughed. But her attention slipped. She'd pulled out too far from the hull. She had to get back into cover. She dove toward the *Roci*, but too fast. She hit with her feet, trying to roll with the impact the way she'd learned as a girl in her self-defense classes. Her sense of up and down swam, and for a moment she was falling into the stars.

"How you doing, Peaches?" Amos asked, but she was moving. Rushing backward away from the remaining mech. Their friend's unexpected death by PDC had slowed them, made them more cautious. She went farther around the *Roci*, paused to line up a shot, and waited for the enemy to walk into it. It was hard. The sun was in her eyes now, and the helmet struggled

to keep it from blinding her. Her leg ached, but it didn't *hurt*. She wondered if that was normal. The mech lurched into view, and she fired, driving it back. How many rounds had she used? It was on the HUD someplace, but she couldn't remember where. She fired again, and saw a small green six become a five. So. Five rounds left. She waited, a hunter in her blind. She could do this. The red dot jittered and shifted. She tried to bring it back in line. She could do this ...

"Peaches!" Amos shouted. "Your six!"

Clarissa spun. The *Azure Dragon* loomed behind her, the sun high above. She'd run back so far, she'd looped. And arcing up over the enemy ship, two bright, moving shapes. The crew of the *Azure Dragon* wouldn't be able to force their way onto the *Rocinante*, but they could have some small vengeance here. There was no place for her to take cover. She could only stand here and face the remnants of the boarding party descending toward her or charge into the guns of the remaining mech.

"Amos?" she said.

"Go to the airlock! Get back inside!"

She raised her gun, aimed at one of the incoming figures. When she fired, they shifted out of the bullet's path. Her HUD reported fast-movers. It was time to go. She turned toward the drive cone. It seemed farther away than she expected. The suit thrusters kicked in, and she skimmed along, a meter above the hull like a bird flying just above the surface of a lake. Something exploded in her arm, spinning her. Her HUD told her what she already knew. Another wound. The suit was already squeezing at her shoulder to hold as much blood in as it could. To her left, a flash of yellow. The mech, riding plumes of its own thrusters, and coming closer. She dropped her rifle, and it fell away behind her. With one arm, she couldn't aim it anyway, and a little less mass meant a little more speed.

This was it. This was how she died. The idea was weirdly consoling. She'd end here, under billions of stars. In the unending, unshielded light of the sun, fighting for her friends. It felt bright, like a hero's death. Not the cold fading away on a hard, gray cot in the prison infirmary she'd expected. How strange that this should feel like victory. Time seemed to slow, and she wondered if maybe she'd triggered her implants by mistake. That would be silly. Amping up her nervous system would do her exactly no good when all her speed came from the thruster's nozzle. But no. It was only fear and the

certainty that she was rushing to her death.

Naomi and Alex were shouting in her ears. Amos too. She couldn't make sense of any of it. It occurred to her like a conclusion she was watching someone else make that Amos might feel bad when she was gone. She should have told him how grateful she was for every day he'd given her outside the hole. Her helmet alerted. She had to start braking or she'd overshoot the ship. She killed the thrusters and flipped, more from a sense of obligation than from any real hope of living. One of two boarders was spinning away sunward, arms and legs flailing and out of control. The other was above her with their back turned, facing a fast-moving body that had to be Amos. The mech flickered, drawing closer. When she started braking, it seemed to surge toward her, an illusion of relative velocity, but with enough truth to end her.

And then, inexplicably, the mech driver slumped against his harness. The mech arms waved, suddenly uncontrolled. One reached down, gouging the hull and sending the great yellow machine spinning away from the *Rocinante* and toward the stars. She watched, uncomprehending, until a hand grabbed her uninjured shoulder and an arm looped across her back. In the bright sunlight, the other suit's helmet was opaque. She didn't understand what had happened until she heard the voice over her radio.

"It's all right," Holden said. "I've got you."

Amos woke her. His wide face and bald head seemed like a dream. But that was likely just the drugs playing with her perceptions.

The regrowth cocktail did strange things to her mind, even if the painkillers didn't. Given the choice of feeling numb and stupid or alert and in pain, she chose pain. Wide elastic restraints held her to the bed of the medical bay. The autodoc fed her body what it needed, and only occasionally threw out errors, confused by the leakage from her after-market endocrine system. Her humerus was shattered, but growing back together. The first bullet had carved a groove ten centimeters long through the muscles of her thigh and shocked the bone, but didn't break it.

"You okay, Peaches? I brought you some food, and I was just going to

leave it for you, but you were ... You looked ...” He waved a hand.

“I’m fine,” she said. “I mean all shot up, but I’m fine.”

He sat on the side of her bed, and she realized they were under thrust. The smell of artificial peach cobbler was inviting and nauseating at the same time. She undid her restraints and sat up on her good elbow.

“Did we win?” she asked.

“Oh hell yeah. Two prisoners. Data core off the *Azure Dragon*. They tried to scrub it, but between Naomi and the *Roci*, we’ll put it back together. Bobbie’s straight-up pissed that she missed the action.”

“Maybe next time,” she said, and Holden came into the room.

He and Amos nodded to each other. The big man left.

“We should probably have had this talk before,” Holden said.

The *Roci*’s captain stood at the bedside, looking like he wasn’t sure whether to sit. She couldn’t say whether it was the trauma or the drugs, but she was surprised to notice that he didn’t look like her mental image of him. In her mind, his cheeks were higher, his jaw wider. The blue of his eyes more icy. This man looked—not older. Only different. His hair was messy. There were lines forming around his eyes and the corners of his mouth. Not there yet, but coming. His temples were touched with gray. That wasn’t what made him look different, though. The James Holden who was king of her personal mythology was sure of himself, and this man was profoundly ill at ease.

“Okay,” she said, not certain what else to say.

Holden crossed his arms. “I ... um. Yeah, I didn’t really expect you to come on this ship. I’m not comfortable with it.”

“I know,” she said. “I’m sorry.”

He waved the comment away. “It’s made me skip this part, and I shouldn’t have. That’s on me, okay? I know you and Amos trekked across a big part of North America after the rocks came down, and I know that you handled yourself just fine then. And you have experience on ships.”

Experience as a terrorist and murderer, he didn’t say.

“The thing is,” he went on, “you aren’t trained for this kind of action. Going out on the float with a gun in your hand is different from being on the ground. Or being a technician inside a ship. You’ve got those implants, but using them out there, you’d have wound up crashing out and choking to death on your own vomit, right?”

“Probably,” she said.

“So going out again like that’s not something you should do. Amos took you because ... because he wants you to know you belong here.”

“But I don’t,” she said. “That’s what you’re saying.”

“Not everyplace Amos goes, no,” Holden said. He met her gaze for the first time. He looked almost sad. She couldn’t understand why. “But as long as you’re on my ship, you’re crew. And it’s my job to protect you. I screwed that up. You don’t go into battle in a vac suit anymore. At least not until I think you’re trained. That’s an order. Understood?”

“Understood,” she said. And then, trying the word out to see how it felt in her mouth, “Understood, sir.”

He had been her sworn enemy. He had been the symbol of her failure. He’d even become a symbol, somehow, of the life she could have had if she’d made different choices. He was only a man in his early middle age that she barely knew, though they had some friends in common. He tried a smile, and she returned it. It was so little. It was something.

She finished her cobbler after he left, then closed her eyes to rest them and didn’t know she’d fallen asleep until the dream came.

She was digging through slick, black mud-sticky shit, trying to get down to where someone was buried. She had to hurry, because they were running out of air. In the dream, she could feel the wet cold against her fingers, the disgust welling up at the back of her throat. And the fear. And the heartbreaking loss that came from knowing she wouldn’t make it in time.

Chapter Eight: Dawes

The first session of Marco's impromptu summit began when Michio Pa arrived, looking pleasant and implacable in equal measures. Her ship had docked halfway through a day cycle, so Marco only kept them for a few hours. The following three days were more punishing, the meetings lasting over thirteen hours each day without even so much as a break for meals. They'd eaten at the meeting tables while Marco laid out his vision for a grand, system-spanning network of Belter civilization.

Free spin stations, automated factories and farms, power stations hunkered close to the sun and beaming energy to the human habitations, the large-scale stripping of biological resources from the corpse of the Earth. It was a grand and beautiful vision with a scope and depth that dwarfed even the Martian terraforming project. And Marco Inaros presented it all with a ruthlessness and intensity that made the objections the rest of them brought up seem small and petty.

Sanjrani wanted to know how the labor force needed to create Marco's massive snowflake-complex void cities would be trained. Marco waved the problem away. Belters were already trained to live and build in space. That knowledge was their birthright. Bred into their brittle bones. Pa brought up the problem of keeping food and medical supplies flowing to all the stations and ships already feeling the pinch from the loss of supply lines from Earth. Marco agreed that there would be lean times, but assured Pa that her fears were greater than the actual problem. No objection any of them raised swayed his commitment. His eyes were bright, his voice rich as a viol, his energy was boundless. After the meetings were done, Dawes went back to his quarters, weary to the bone. Marco went to the bars and pubs and union halls and spoke directly to the citizens of Ceres. If he slept, Dawes didn't know when.

On the fifth day, they took a break, and it felt like collapsing at the end

of a long run.

Rosenfeld's interpretation did little to help.

"Coyo is manic. He'll come back down."

"And then what?" Dawes asked.

The pebble-skinned man shrugged. His smile had very little to do with pleasure. "Then we'll see where we are. Inaros is a great man. For our purposes, he's *the* great man. It isn't a role that's fit for a wholly sane person."

They sat in the gardens of the governor's palace. The smell of plants and soil mixed with the textured protein and grilled peppers that Rosenfeld preferred for breakfast. Dawes leaned back from the table and sipped from his bulb of hot, milky tea. He'd known Rosenfeld Guoliang for almost three decades, and he trusted him as much as he trusted anyone. But not completely.

"If you're saying he's gone mad," Dawes said, "that's a problem."

"It's not a problem, it's a job requirement," Rosenfeld said, waving the concern away like it was a gnat. "He's slaughtered billions of people and remade the shape of human civilization. No one can do something on that scale and see themselves as fully human anymore. He may be a god or he may be a devil, but he can't stomach the idea of being just an unreasonably pretty man who stumbled into the right combination of charisma and opportunity. This particular fever will pass. He'll stop sounding like we're making the first weld next week and start saying that our grandchildren's grandchildren will finish it. Never been anyone as good at changing the song without missing a beat as our man Marco. Don't you worry."

"Hard not to."

"Well. Only worry a little." Rosenfeld took a thick bite of the protein and pepper, his rough eyelids lowering until he looked almost half-asleep. "We're all here because he needed us. Apart from Fred Johnson, I had the only fighting force large enough to cause him trouble. Sanjrani's a prat, but he ran Europa's artificial economy well enough that everyone thinks he's a genius. And who knows? Maybe he is. You control the port city of the Belt. Pa's the poster child of dissenting from the OPA for moral reasons, and so she makes a fine Father Christmas for redistributing wealth to the groundlings and bringing the old loyalists over to us. No one in these meetings is here by chance. He put this team together. As long as we keep a

unified front, we can keep him from floating away on his own grandiosity.”

“I hope you’re right.”

Rosenfeld chewed and grinned at the same time. “So do I.”

Anderson Dawes had been part of the OPA since before he was born. Trying to curry favor with their corporate overlords, his parents had named him after a mining company. Later, Fred Johnson’s butchery turned that same name into one of Earth’s greatest crimes against the Belt. He’d been raised to see the Belt as his home and the people living there—however different, however divided—as his kin. His father had been an organizer, his mother a union lawyer. He’d learned that all humanity was a negotiation even before he’d learned how to read. Everything in his life since then was an elaboration of the same simple theme: push hard enough that he never lost ground and never let an opportunity pass.

Always, his intention had been to put the Belt in its right place and end the casual exploitation of its people and wealth. How exactly that happened, he’d let the universe decide. He’d worked with the Persian Gulf Shared Interest Zone in rebuilding the station at L-4 and made contacts in the expatriate community there. He’d become a voice within the OPA on Ceres by showing up early at every meeting, listening carefully before he spoke, and making certain the right people knew his name.

Violence had always been a part of the environment. When he’d had to kill people, those people had died. When he found a promising young tech, he knew how to recruit them. Or an old enemy ripe to be turned. He’d brought Fred Johnson, the Butcher of Anderson Station, into the fold when everyone called him crazy, and then accepted their accolades when he’d bloodied the nose of the United Nations by doing it. Later, when it became clear that Johnson was unwilling to cooperate with the new regime, he’d agreed to cut him out. If watching his namesake go from a moderately successful Belter mining station to the rallying cry of Belter revolution had taught him anything, it was this: Situations change and clinging too tightly to what came before kills you.

And so when Marco Inaros struck his deal with the blackest black market on Mars to create a successor to the Outer Planets Alliance, Dawes had seen only two choices: Embrace the new reality or die with the past. He’d picked the way he always had, and because of it, he was at the table. Sometimes for thirteen hours while Inaros ranted his utopian dream-logic,

but at the table nonetheless.

Still, there was part of him that wished this Winston Duarte had chosen to raise someone else up with his Mephistophelean arms deal.

He took another bite of his breakfast, but the peppers had gone cold and limp, and the protein had begun to harden. He dropped his fork.

“Any word from Medina?” he asked.

Rosenfeld shrugged. “Do you mean the station, or past it?”

“Anything, really.”

“Station’s well,” Rosenfeld said. “The defenses are in place, so that’s as it should be. Past that ... well, no one knows, sa sa? Duarte’s keeping up his end, sending shipments of arms and equipment back from Laconia. The other colonies ...”

“Problems,” Dawes said. He didn’t make it a question.

Rosenfeld scowled at his plate, avoiding eye contact for the first time since their unofficial meeting began. “Frontiers are dangerous places. Things happen there that wouldn’t if it were more civilized. Wakefield went silent. Some people are saying they woke something up there, but no one’s sent a ship out to look. Who has time, yeah? Got a war here to finish. Then we can look back out.”

“And the *Barkeith*?”

Rosenfeld’s gaze stayed fixed on the peppers. “Duarte’s people say they’re looking into it. Not to worry. Not blaming us.”

Everything in the other man’s body told Dawes not to press further, and he was almost ready to let it go. He could change the angle of attack, at least. “How is it all the other colonies are fighting to grow enough food, not have their hydroponics collapse like on Welker, but Laconia’s already got a manufacturing base?”

“Just means it’s better planned. Better funded. The thing you don’t understand about this pinché Martian Duarte is—”

Dawes’ hand terminal blatted out an alert. High-priority connection request. The channel he used for station emergencies. Captain Shaddid. He held up a finger, asking Rosenfeld’s patience, and accepted the connection.

“What’s the matter?” he said instead of hello.

Shaddid was at her desk. He recognized the wall behind her. “I need you down here. One of my men is in the hospital. Medic says he may not make it. I have the shooter in custody.”

“Good that you caught him.”

“His name’s Filip Inaros.”

Dawes felt a weight drop into his gut. “I’ll be right there.”

Shaddid had given the boy his own cell. She’d been wise to do so. From the moment he walked into the security station, Dawes had felt the shock and rage like a charge in the atmosphere. Shooting a security officer on Ceres was a short way to an airlock. Or it would have been for most people.

“I put an automated monitor on him,” Shaddid said. “Slaved it to my system. No one else turns it on or off.”

“Because?” Dawes said. He was sitting at her desk. She might be the head of security, but he was the governor of Ceres.

“They’d turn it off,” Shaddid said. “And you wouldn’t ever see that little piece of shit alive again. And just between us, you’d be doing the universe a favor.”

On the screen, Filip Inaros sat against the cell wall, his head tilted back and his eyes closed. He was a young man. Or an old child. As Dawes watched, the boy stretched, wrapped his arms around himself, and settled back without looking around once. He couldn’t tell if it was the movement of someone certain that they were untouchable or frightened that they might not be. Dawes could see the resemblance to Marco, but where the father seemed to radiate charm and confidence, the son was all rage and a vulnerability that made Dawes think of abrasions and raw wounds. Under other circumstances, he might have felt sorry for the prisoner.

“How did it happen?” Dawes asked.

Shaddid tapped on her hand terminal and threw the data to the screen. A corridor outside a nightclub up nearer the center of spin. A door swung open and three people came out, all Belters. A man and woman, their hands caressing each other like they were already in private, and a second young man. A moment later, the door opened again, and Filip Inaros stepped out. There was no sound, so Dawes didn’t know what Filip had shouted at the retreating figures, only that he had. The single young man turned back, and the couple paused to watch. Filip’s head was back, his chest out. For

generations, humanity had been free of the gravity well of the inner planets, but the posturing of young men spoiling for a fight never changed.

A new figure stepped into the frame. A man in a security uniform, hands lifted in command. Filip turned toward him, shouting. The security man shouted back, pointed to the wall, ordering Filip against it. The couple turned away and pretended not to know anything about it. The young man who'd been coming back to the fight slowly stepped back, not turning away, but willing to let his enemies spend themselves against each other. Filip went terribly still. Dawes had to force himself not to look away.

The security man reached for his weapon, and a gun appeared in Filip's hand, the kind of magic flicker that comes of hundreds of hours of practicing a fast draw. And then, as part of the same motion, the muzzle flash.

"God dammit," Dawes said.

"It's not subtle," Shaddid said. "He was given a security order. He refused and fired on the agent. If he was anyone else, he'd be feeding mushrooms right now."

Dawes pressed his palm to his mouth, rubbing until his lips felt bruised. There had to be something. Some way to walk this back. "How's your man?"

There was a pause before Shaddid answered. She knew what he was really asking. "Stabilized."

"Not going to die?"

"Not out of the woods yet either," she said. And then, "I can't do my job if people get away with shooting security. I understand there's diplomacy involved, but with respect, that's your job. Mine is to keep six million people from killing too many of each other on any given day."

My job's not so different, he thought. This wasn't the time to say it. "Contact Marco Inaros. He'll be on the *Pella* in dock 65-C," Dawes said. "Tell him to meet me here."

At the end of particularly bad days, Dawes would sometimes pour himself a glass of whiskey and sit for a time with his prized possession: a printed

volume of Marcus Aurelius that had belonged to his grandmother. The *Meditations* were the private thoughts of a person with terrible power—an emperor who could order to death anyone he chose, create the law by speaking it, command any woman to his bed. Or any man, if the mood took him. The thin pages were filled with Aurelius’ private struggle to be a good man despite the frustrations of the world. It left Dawes feeling not comforted but consoled. All through human history, being a moral person and not being pulled into the dramatics and misbehavior of others had caused intelligent people grief.

Dawes had spent decades with that beneath all his personal philosophy. There were bad people everywhere, stupidity and avarice and hubris and pride. And he had to navigate it if there was ever to be hope of a better place for Belters. It wasn’t that things were worse now than they’d been before. Only that they weren’t better.

Tonight, he suspected, would be a good one for rereading his Aurelius.

Marco swept into the security station like he owned it. Smiles and laughter, and a sheer animal presence that filled the space. The security agents unconsciously moved to the edges of the room and didn’t meet his gaze. Dawes went out to lead him back to Shaddid’s office and found himself shaking the man’s hand there in front of everyone. He hadn’t meant to do that.

“This is embarrassing,” Marco said as if he was agreeing with something that had already been said. “I will see that it doesn’t happen again.”

“Your son could have killed one of my people,” Dawes said.

Marco sat back in his chair and opened his arms, an expansive gesture that seemed intended to diminish what anyone else could say. “There was a scuffle, and it got out of hand. Dawes, tell me you’ve never had something like it.”

“I’ve never had something like it,” Dawes said. His voice was cool and hard, and for the first time, Marco’s jovial expression shifted.

“You aren’t going to make this a problem, are you?” Marco said, his voice sinking low. “We have a lot of work to do. Real work. Word’s come that Earth took out the *Azure Dragon*. We have to reassess our strategy down sunward.”

It was the first Dawes had heard of it, and he had the sense that Marco

had kept the information private, ready to play it when he wanted a subject changed. Well, he'd find Dawes harder to throw off than that.

"And we will. But that's not why I called you here."

Shaddid coughed, and Marco turned to scowl at her. When he looked back at Dawes, his expression had changed. His smile was as wide, his expression as open and merry, but something in his eyes made Dawes' stomach clench.

"All right," Marco said. "Bien, coyo mis. Why did you call me here?"

"Your son can't be on my station," Dawes said. "If he stays, I have to put him through a trial. Have to protect him from anyone who might get impatient waiting." He paused. "Have to follow through the sentence, if there is one."

Marco went still, a copy of his son on the assault footage. Dawes made an effort not to swallow.

"That sounds like a threat, Anderson."

"It's an explanation. It's why you need to take your boy off my station, and never bring him back to it. I'm doing this as a favor. Anyone else, and things would just take their course."

Marco drew in a long, slow breath and let it out between his teeth. "I see."

"He shot a security agent. He may have killed him."

"We've killed a world," Marco said, waving the words away. But then he seemed to remember something, nodding as much to himself as to Dawes or Shaddid. "But I appreciate your bending the rules for me. And for him. I won't let this go by. He and I will have a serious conversation."

"All right," Dawes said. "Captain Shaddid will release him to you. If you want to bring some of your people down before she does—"

"That won't be necessary," Marco said. No bodyguards were called for. None of the security force would dare face down Marco Inaros of the Free Navy. And what was worse, Dawes believed Marco was right. "We'll have a meeting tomorrow. About the *Azure Dragon* and Earth. Next steps."

"Next steps," Dawes agreed, and stood. "You know this isn't temporary. Filip can never set foot on Ceres again."

Marco's smile was unexpected and deep. His dark eyes flashed. "Don't worry, old friend. If you don't want him here, he won't be here. That's a promise."

Chapter Nine: Holden

The sound reached all the way to the galley: a deep thud, then a pause, then another thud. Each time it came, Holden felt himself flinch a little. Naomi and Alex sat with him, trying to ignore it, but whatever they started a conversation about—the state of the ship, the success of their mission, the question of whether to give in to fate and convert a section of the crew quarters into a brig—it died out under the slow, unending beat.

“Maybe I should talk to her,” Holden said. “I think I should.”

“Don’t know why you think that,” Alex said.

Naomi shrugged, abstaining. Holden took one last bite of his fake lamb, wiped his mouth with the napkin, and dropped everything into the recycler. Part of him hoped that one of them would stop him. They didn’t.

The *Rocinante*’s gym showed its age. No two resistance bands were quite the same color, the green-gray mats had white lines where the fabric had worn thin, and the smell of old sweat softened the air. Bobbie had strung a heavy bag on a tight line between the ceiling and the deck. Her exercise outfit was tight and gray and soaked with sweat. Her hair was tied back, and her eyes were locked on the bag as she shifted on the balls of her feet. As Holden stepped into the room, she turned to the left, putting her weight into a roundhouse kick. This close, the thud sounded like something heavy being dropped. The system reported a little under ninety-five kilograms per square centimeter. Bobbie danced back, her focus locked on the bag. She shifted to the right, and kicked with her other leg. The thud was a little softer, but the reading went up by three kilos. She danced back, reset. Her shins were red and raw-looking.

“Hey,” she said, not looking at him. Thud. Reset.

“Hey,” Holden said. “How’re you doing?”

“Fine.” Thud. Reset.

“Anything you want to talk about?”

Thud. Reset. “Nope.”

“Okay. Well. If you ah”—Thud. Reset.—“change your mind.”

“I’ll track you down.” Thud. Reset. Thud.

“Great,” Holden said, and stepped back out of the room. Bobbie hadn’t looked at him once.

In the galley, Naomi had a bulb of coffee waiting for him. He sat across from her while Alex dropped the last of his food into the recycler. Holden drank. The *Roci*’s processors were calibrated once a week, and they’d stocked up before leaving Luna, so it was almost certainly his imagination that made the coffee more bitter than usual. He put a pinch of salt in it anyway, swirling the bulb to stir it.

“You knew that wasn’t going to work,” he said.

“I expected it wasn’t,” Naomi said. “I didn’t know.”

“Just suspected.”

“Strongly suspected,” she said. It was almost an apology. “I could have been surprised.”

“You got to give Bobbie her room, Cap,” Alex said. “She’ll come out the other side of it.”

“I just ... I wish I understood what’s bothering her so much.”

Alex blinked. “She’s been spoiling to take the fight to some bad guys ever since Io. Now she got one, and she was stuck in a box while the rest of us did the shooting.”

“But we won.”

“We did,” Naomi said. “And she watched us do it while we tried to figure out how to get her out of a trap. By the time she was free, it was over.”

Holden sipped at the coffee. It was a little better. That didn’t help. “Okay, so what I meant was I wish I understood what was bothering her in hopes that then there’d be something I could do about it.”

“We know,” Naomi said. “The difficulty isn’t lost on us.”

Amos’ voice came over the ship’s comm. “Anybody there? I’ve been paging ops for the last ten minutes.”

Alex thumbed the system on. “On my way up now.”

“Okay. I think I tracked down the last leak. Let me know what it looks like from your end.”

“Will do,” Alex said, nodded to the two of them, and headed up toward

ops and the ongoing repair effort. The *Azure Dragon*'s crew hadn't had all that long, but they hadn't been trying for clean either. It was easier to cut through a lot of hull quickly when you didn't care what broke while you did it. Knowing that the ship wasn't right yet was like an itch he couldn't quite reach. Part of that came from knowing how strapped the shipyards on Luna were going to be. The days of sloping into Tycho and having Fred Johnson's teams patch the ship up were probably gone, and Luna had Earth's navy to take precedence over Holden and his crew.

It wasn't just that, though. It was also the same thing he'd felt driving him to talk to Bobbie. And to Clarissa Mao before that. He wanted things to be all right, and he had the growing feeling that they weren't. That they weren't going to be.

"What about you?" Naomi said, looking at him from under a spill of dark, gently curled hair. "Want to talk?"

He chuckled. "I do, but I don't know what to say. Here we are, the conquering heroes with prisoners and a salvaged data core, and it doesn't feel like enough."

"It isn't."

"Always so comforting."

"I mean you're not wrong. You aren't uneasy and disturbed by all this because there's something wrong with you. This is all uneasing and disturbing. You aren't fucked up. The situation is."

"That doesn't ... You know, that actually does make me feel a little better."

"Good," she said. "Because I need to know this isn't about Marco and Filip. That ... all that isn't making it hard for you to have me around."

"No," Holden said. "We covered that."

"And we'll cover it again after this, I'm sure. But if you'd just keep saying it?"

"I would put everyone else that exists headfirst out an airlock just to keep you around. It isn't that. The only concern I have about you and Marco Inaros is that he'll try to hurt you again."

"That's nice to know."

"I still love you. I will always love you."

He was answering the question he thought she was asking, but her gaze cut away. Her smile was rueful, but it was also real. "Always is a long

time.”

“I’m captain of this ship. Technically, I could marry us right now.”

Now she laughed. “Would you want to?”

“I’m easy. It seems a little redundant. Husband and wife seems like a less interesting and committed relationship than Holden and Naomi,” he said. “He can’t win, you know.”

“Of course he can. Marco’s the one who decides when he wins.”

“No, I’ve been thinking about it. The Free Navy ... is untenable. They did a lot of damage. They killed a lot of people. But all of this is really about the gates. If it wasn’t for all the people rushing out to try to found a new colony, Mars wouldn’t be collapsing. The Belters wouldn’t be worried that they’ll get marginalized out of existence. None of the things that gave Marco a toehold would have happened. But the gates aren’t going away. So all the pressures he’s fighting against? They’ll outlast him. People are still going to want to get out to the new systems, and they’re going to find ways to do it. And the colonies that are already out there are going to want to keep in contact and trade with us. At least until they’re really on their feet, and that could take generations.”

“You think he’s on the wrong side of history.”

“He is,” Holden said.

“Then what does that say about people like me? I grew up in the Belt. I wouldn’t want to live down a gravity well. The gates aren’t going away, but neither are the Belters. Unless they are.”

“What do you mean?”

She shrugged. “Human history has seen plenty of genocides. If you’re right, then the long term is either the gates or the Belters. And Belters ... We’re human. We’re fragile. We die. The gates? Even if we could destroy them, we wouldn’t. There’s too much real estate involved.”

Holden looked down. “All right. That was my turn.”

Naomi lifted a questioning eyebrow.

“That was less comforting than I meant it to be,” he said. “Sorry.”

“It’s all right. Anyway, that’s not what I meant when I said Marco decides when he wins. You don’t understand how slippery he can be. Whatever happens, he’ll shift so it was his plan all along. If he were the last person alive, he’d say we needed the apocalypse and declare victory. It’s what he is.”

Even though they were the agents of Chrisjen Avasarala's will, it took seventeen hours for the *Rocinante* and the *Azure Dragon* to get berths on Luna. When they finally did, they were at a military yard outside Patsaev complex, where the civilian relief ships were landing. The docks were crowded with people in bunches and lines, some of them staring blankly ahead like victims of a fever, some weeping with relief or exhaustion or both. The air stank of sweat and felt stale, even where the intakes made the greatest breeze.

The Luna Station complex—shipyards and convention centers, hotels and residence centers, schools and office complexes and warehouses—was big enough to fit a hundred million bodies, but the environmental infrastructure would overload at something like half that, even with the advantage of the moon's mass and conduction to soak up waste heat. The Lagrange stations had less margin. Holden tried to do the math in his head as they forged their path through the crowd. The estimates said that one-half of Earth was dead already. Fifteen billion gone or going so fast there was no way to save them. Of those still alive, two-thirds were living in what the newsfeeds were calling "distressed situations." Ten billion people who needed food or water or shelter. And up the well, there were places for maybe as many as a quarter million. Two-and-a-half-hundred-thousandths of a percent of the people in need. He couldn't believe that was right, and tried to figure it again. He came to the same number.

And a thousand worlds out there, just on the other side of the gates. Hostile worlds, most of them, but not more hostile than Earth. Not now. If there were a way to teleport them from Boston and Lisbon and Bangkok, maybe they'd be saved. Maybe they'd go on to raise something new and beautiful out of the ruins of Earth, and if one system didn't, there'd be a thousand other chances.

Except that there wouldn't be, because the transportation was too hard. So they'd die where they stood because there was no way to get them all someplace better fast enough for it to matter.

"You okay, Cap?" Amos asked.

“Fine. Why?”

“Looks like you’re getting ready to hit someone.”

“No,” Holden said. “Wouldn’t help.”

“Over here,” Bobbie said.

The guards outside the administrative offices carried small automatic weapons and wore body armor. They stood aside and let Bobbie shuffle through the wide gray door, and all of the others behind her in a line like ducklings. The offices could have been a different world. Full-spectrum lights glowed like Holden’s memory of a summer afternoon. Ferns and ivy bobbed in the gentle breeze from the air recyclers. The hallways were half a meter wider than the corridors of the *Rocinante*, and felt luxurious. Only the faint gunpowder stink of moondust and the one-tenth g spoke of Luna. Everything else would have looked at home in the UN offices at The Hague.

Bobbie led them like she knew where she was going, down one hall, past another pair of armed guards, and through a set of frosted glass doors. The room was built like a lounge—chairs and divans around low tables. Eight or ten people were scattered around in pairs and small groups, and for a few seconds, Holden didn’t understand who they were.

At some point, everything had been either black or white, but use had left splashes of color. The brown ring of a coffee stain on a cushion, the greenish scrape along the side of a chair. Avasarala stood at the far side of the room, her orange sari blazing like a torch while she talked to a white-haired woman with dark skin and narrow hips. When Avasarala looked up to smile at him, the woman turned. Holden stumbled.

“Momma Sophie?” he said, and then, like a lens coming into focus, he saw all the others for who they were. The years had changed them all, and seeing them through cameras and screens wasn’t the same. Father Tom had gained weight, and Father Cesar had lost it, but they were there, hand in hand, walking toward him. Father Anton had gone bald, and Mother Elise seemed older, and frailer in person than she had on the screen. And shorter. Everyone seemed shorter, because the system at the farmhouse had been on a desk. He’d been looking up at all of them from that desktop for years and hadn’t realized it until just now.

All eight of his parents crowded around him, their bodies pressing gently against his, their arms around each other, the way they had when

he'd been a child. Holden found himself weeping, swept away by the memory of being a little boy surrounded and protected by the loving bodies of eight strong adults. He stood among them now, the strongest of the lot, shaken by the love and the joy and the terrible understanding that both the boy he'd been and the men and women they were then were gone and would never come back. They were all crying too. Father Dimitri, Mother Tamara, Father Joseph. And his new family too.

Naomi pressed her hand to her lips, like she was trying to hold words or emotions in. Alex was grinning as widely as any of Holden's family, his eyes shining. Avasarala and Bobbie seemed pleased, like people who'd pulled off a good surprise party. Weirdly, Clarissa Mao, standing alone with a pressure cast on her wounded arm, was shaking with barely controlled sobs. Amos looked at all of them like he'd walked in on the last line of a joke, then shrugged and let them get on with whatever the hell this was. Holden felt a rush of affection for the man.

"Wait," he said. "Wait. Everyone, I need you to meet ... everyone else. I guess. This is Naomi, everyone."

His parents all turned toward her. Naomi's eyes widened a degree. The little, panicked flare of her nostrils was probably something only he could see. There was a pause he hadn't expected, a stuttering moment when he saw her through their eyes: Here is the Belter girl their son was sleeping with. Here is the ex-lover of the man who killed the world, the representative of everything that had happened. One of *them*. It lasted a heartbeat, then another. It was vast as the space between worlds.

"I've heard so much about you, dear," Mother Elise said, moving to Naomi and taking her in a wide embrace. The others followed, queuing up to welcome her to the family. But it wasn't an illusion. The moment had been there. Even when his two families diffused into each other—Father Dimitri and Father Anton and Alex talking about the ship, Mother Tamara and Amos looking at each other with a kind of amused bewilderment—Holden felt the hesitation. They would love her if he said so, but she wasn't one of their kind.

He barely noticed Bobbie at his side until she spoke. "This is how she does it. She finds a way to pay you."

She nodded toward the back of the room. Avasarala stood alone, watching with a smile that didn't quite reach her eyes. Holden went to her.

“They told me they were all right,” he said. “When I talked to them, they said they weren’t in danger.”

“It was true, as far as it went,” Avasarala said. “The reactors hadn’t failed there yet. And they had more food stored than most. They might have lasted another ... month? How should I know? Canning. Who the fuck does their own canning anymore?”

“But you evacuated them.”

“Another week, another month. Not another year. They wouldn’t have been safe forever, and once they realized they were fucked, all the slots would have been filled. I flagged them as priority evacuees. I get to do that kind of shit. I’m the boss.”

“Where ...”

She shrugged. “They’ll have quarters here or on L-4. Not as big as they had in Montana, but together. I can do that much. Maybe they’ll even go back to their farm someday when all this is done. Stranger things have happened.”

Holden took her hand. It was cool and hard and stronger than he’d expected. She turned to look him in the eye for the first time since he’d come into the room. The smile edged into the corners of her eyes.

“Thank you,” he said. “I owe you one.”

Her smile shifted, losing the formality and coolness and distance it had carried beneath the surface. She chuckled deep in her throat.

“I know,” she said.

Chapter Ten: Avasarala

She didn't sleep anymore, or at least it didn't help when she did. The bed in her suite was spongy, but she didn't sink into it the way that a lifetime at normal gravity made her body expect, so it felt too soft and too hard at the same time. And sleep was supposed to mean rest. There was no rest anymore. She closed her eyes and her mind stumbled on like it was falling down stairs. Mortality rates and supply windows and security briefings—all the things that filled her so-called waking hours filled her nights as well. Being asleep only meant they lost what little coherence they had. It didn't feel like sleeping. It felt like going mad and catatonic for a few hours and then regaining enough sanity to push through for eighteen or twenty hours more before collapsing into herself again. It was shit. But it needed doing, so she did it.

At least she had a shower.

"It seems like Bobbie Draper managed to keep Holden from screwing the mission up," she said, drying her hair. The suite glowed a soft blue, like the promise of dawn. Not that any dawn looked like that on Earth now. But it had once. "I like that girl. I worry for her. She's been sitting behind a desk too long. It doesn't suit her."

She considered the saris in her dresser, running her finger across the cloth and listening to the sound of skin against fabric. She opted for a green one that shimmered like a beetle's carapace. Gold embroidery along the edges that caught the false sunlight made it look cheerful and powerful at the same time. And she had the amber necklace with the jade that went with it. Fashion. All humanity shitting itself to death, and she still had to worry what she looked like going into the meetings. Pathetic.

Aloud, she said, "Gies and Basrat sent word today. Everyone thought they were dead, but they were holed up under a mountain in the Julian Alps. Probably didn't plan to pop their heads above ground until everything was

settled, but you know how Amanda is. It's never real with her unless someone knows she has it better. I don't know why you liked them."

She caught her mistake too late, and something vast and dangerous shifted in her heart. She took a deep breath, bit her lip, and went back to wrapping her sari in place.

"Once we have the Free Navy under control, we'll have to do something about emigration. No one's going to want to stay on Earth. At this rate, I may take off. Retire on some alien ocean where I don't have to feel like I'm responsible for making the waves go up and down. Mars will never sort itself out. Smith? He puts a brave face on it, but he's not a prime minister. He's hospice nurse for a republic. Anytime I start feeling like my job's bad, I just have a drink with him."

They were all things she'd said before, in some variation. There were new things every day—reports from the planetary surface, from the surveillance drones around Venus, from her covert service agents on Iapetus and Ceres and Pallas. With the Free Navy busy making the OPA look measured and rational, Fred Johnson could still be of use making contact with the reservoirs of the Belt that understood how dangerous Marco Inaros was and how the damage already done could spiral into something even worse. God knew he never brought in good news. But for everything new, for every irrevocable tick of the clock, there were the things she cycled back to. The ones she revisited again and again like rereading a favorite book. Or poem. Things she said *because* she had said them before.

"There was a thing you read me one time. About jack pines," she said, digging through her jewelry box for her necklace and the gold bracelets that would go with the embroidery. "Do you remember it? All I have is that it ended 'da-dah, da-dah, da-dah, da-dah, and paved the way to Paradise.' It was about how the seeds needed a fire before they could spread. I told you it sounded like a sophomore girl trying to make the break up with her abusive boyfriend sound deep. That poem. I can't get it out of my head now, and I can't remember it either. It's annoying."

The bracelets slid into place. The necklace settled too lightly on her collarbone. She sat at her table, touching on eyeliner, tapping a nearly homeopathic bit of rouge onto her cheeks. Just enough to make her look more vital than she felt. Not enough to make it seem like she was wearing makeup. The smell of the rouge reminded her of the apartment in Denmark

she'd kept during university. God, her mind was everywhere these days. When she finished, she turned to her hand terminal. The indicator showed she was still recording. She smiled into the camera.

"I have to put the mask on now. Go wade into it all again. They still haven't found you, but I tell myself that they will. That I would know it if you were dead. I don't know it, so it isn't true. But it's getting harder, love. And if you don't come back soon, I'll have saved so many of these messages, you'll spend half a semester just catching up to me."

Except, she thought, there wouldn't be semesters. Or poetry courses. Or any of the things that had made her life hers before the rocks fell. And then, almost as if he was there, Arjun's dissenting voice murmured in her mind, *There will always be poetry.*

"I love you," she said to the hand terminal. "I will always love you. Even ..." She hadn't said it before. Hadn't let herself think it. There was a first time for everything. A last time too. "Even if you're not here."

She stopped recording, repaired the damage her tears had done to the makeup, and lowered her head like an actor preparing to take the stage. When she lifted her eyes again, they were harder. She made the connection request to Said, and he answered immediately. He'd been waiting.

"Good morning, Madam Secretary," he said.

"Cut the bullshit. What fresh hell are we facing today?"

"You have a meeting with Gorman Le from the scientific service in half an hour. Then breakfast with Prime Minister Smith. An interview with Karol Stepanov of the *Eastern Economic Strategic Report*, and then the meeting with the Strategy and Response Committee. That will last until lunch, ma'am."

"Stepanov. He was the one who got the Cigdem Toker Award three years ago for the piece on Dashiell Moraga?"

"I ... I can check, ma'am."

"For fuck's sake, Said. Try to keep up here. He is. I'm sure of it. I should talk to his wife before I meet with him," she said. "Is there a place we can push him to in the afternoon?"

"I can make space, ma'am."

"Do that. And make sure Smith is a private audience. I'm sick of every fucking thing I do being under a microscope. If I get an ass polyp, I'll find out about it on *Le Monde*."

“If you say so, ma’am.”

“I say so. Send the cart. Let’s get this over with.”

Gorman Le was a thin man with light brown hair salted with white and jade green eyes that Avasarala guessed were cosmetic. She hadn’t known him before she came to Luna. He’d been promoted above his level of preparation when the rocks fell, and it showed in his overly somber bearing and the way he cleared his throat before he spoke.

“The ships that ... failed to complete the transition tended to be larger in mass,” he said. “The *Oleander-Swift*, the *Barbatana de Tubarão*, and the *Harmony* all follow that pattern. The *Casa Azul* doesn’t match that, though.”

The science service had always been a large presence on Luna. It was where the first broad-array telescope had been built, up free from the interference of atmosphere. The first permanent moon base had been equally divided between military posturing and research. But the generations that had risen and fallen since then had left the Luna science service behind, pressing out to the places where the action really was: Ganymede, Titan, Iapetus. God help them all, Phoebe. It left the Luna-based service office hardly more than admin offices and children’s science-fair projects. The meeting room they were in was gray-green with wall screens left cloudy by years of fine abrasion and fake leather chairs.

“I’m hearing you say there’s no consistent pattern,” Avasarala said.

Gorman Le pressed his jaw tight and flapped his hands in frustration. “There are patterns. There are any number of patterns. They all had drives built within a twenty-month window. They were all using reaction mass harvested from Saturn. They all went missing in high-traffic periods. They all had the sequence ‘four-five-two-one’ in their long-form registry codes. With this little to go on, I can find as many patterns as you want that match all the missing ships. But which one matters? No, I can’t tell you that.”

“Any ships with four-five-two-one in the registry code make it through?”

Gorman Le made a small huffing sound, like an angry hamster, then

looked down and blushed. “The *Jaquenetta*, registered out of Ganymede. It went through between the *Oleander-Swift* and the *Harmony*. Reported back from Walton with no trouble.”

“Well,” Avasarala said, amused that he’d actually tracked that down, “we can at least say that one’s less likely to be it, then.”

“Yes, ma’am,” Gorman Le said. “Ma’am, if we could get further data ... I’m certain that Medina Station has flight records for all of these. Maybe others. *And* for the ones that didn’t have trouble. If we could just—”

“If we controlled Medina Station,” Avasarala said, “a lot of things would be different. Do we have anything from our Martian friends about why their rogue navy was so interested in the Laconia gate?”

“Not even confirmation that that’s where the breakaway ships went.”

Avasarala scowled. “Keeping their knees closed after they’re already fucked. Typical. I’ll talk to Smith. We can’t get Medina, but we should fucking well manage access to all the data we *do* have.”

“Thank you, ma’am,” Gorman Le said, but he said it to her back. She was already moving on.

Motion helped. The sense of doing things, of progressing, of the problems getting clearer and the solutions—where there were any—getting closer kept the despair at bay. It was harder for Smith. He was a world away from his home and his staff. There just wasn’t as much Martian infrastructure on Luna. When he wasn’t in meetings or trading messages across twelve minutes of light delay, he sat in his suite and watched the newsfeeds calling him an idiot and a buffoon and the man whose inattention had let the Martian Congressional Republic Navy be sold to terrorists and pirates. He didn’t even have managing the worst catastrophe in human history to keep his mind off feeling sorry for himself.

He met her at the door. In simple sand-colored slacks and a white collarless shirt with the sleeves rolled up, he could have been a salesman or a minor prelate. His smile was professionally genuine and warm, the same way it always was. She stepped into the rooms and glanced around. No one. Not even security. A private audience indeed. Score one for Said.

Their breakfast waited in the dining room—poached eggs and thick, buttered toast. The sort of simple, elegant fare that she imagined royalty through the ages had enjoyed while the people they ruled died. She also saw the half-empty bottle of wine on the floor by the sofa, the wall screen tuned

to an entertainment feed showing a slightly risqué comedy that had come out three years earlier. Shannon Poe and Lakash Hedayat were naked and trying to cover themselves with the same beach towel without looking at the other or touching skin to skin. In context, it might have been funny. Smith followed her gaze and turned off the screen.

“Laughter,” he said. “A balm in hard times.”

“I’ll have to try it,” she said. He pulled her chair out for her, and she let him. “I had a few things I wanted to run past you, but before that? I understand why your intelligence service is hiding information about Duarte, but why the fuck are you keeping the data about the gate-eaten ships to yourself? Are you looking to trade it for something, because unless it’s sexual favors, we haven’t got jack shit.”

“The eggs are good,” Smith said.

“You want eggs? I’ll have them squeeze a chicken. I want the data on the missing ships.”

Smith smiled and nodded as if she’d said something mild and polite. The pale flesh of the egg dripped gold on the way to his mouth. The yolk splattered his shirtfront, but he didn’t seem to notice.

“What is it?” she asked.

“I ... You’ll have to take the matter up with my successor. I’ve had word today. The opposition is calling for a vote of no confidence. I will be out of office by this evening.”

Avasarala took in a deep breath and let it out through her teeth. The silence between them was rich until she broke it. “Fuck.”

“They’re angry and they’re frightened. They need someone to blame. I’m the obvious choice.”

“Who are they putting up?”

“Olivia Liu and Chahaya Nelson were both mentioned. It’s going to be Emily Richards, though.”

Avasarala chewed a bite of egg, but didn’t taste it. Richards wasn’t bad. She was serious, at least. Liu and Nelson were too entrenched in what Mars had been. They wouldn’t be ready for what it was becoming. Richards women made good policy. Always had.

“I’m sorry,” she said. “This must be hard for you.”

“Politicians are gamblers,” Smith said. “We do our best to bend the odds, but the universe does what it does.”

Bullshit, she thought. Politicians are the frontal lobes of the body politic. *The universe does what it does*. They'd be better off without him. Only not yet.

"You have a day," she said. "Get me the data before it's too late."

"Chrisjen—"

"What are they going to do? Fire you? Fuck them—give me the data so I can get the problems fixed. If they give you too much shit, I'll offer you asylum."

He laughed and leaned back in his chair. His eyes shifted to the dead wall screen, then back to her. She wondered if the wine by the sofa had been his first bottle.

"Promise?" he asked as if it was a joke. She smiled.

The Strategy and Response Committee. Admirals Pycior and Souther. Parris Kanter from Human Development back at The Hague. Michael Harrow from Aquaculture. Barry Li and Simon Gutierrez from Transportation and Tariffs. Not the dream team she'd have chosen, but the best of who she had left. Sitting around the dark glass table, they all looked as tired as she felt. Good. They should be.

"Mars," Avasarala said. "Smith is out on his ass. Emily Richards is taking over. I'm reaching out to her now. I don't know whether she'll be more open, but I wouldn't assume it. What do you have?"

Li spoke first. Exhaustion made his lisp worse, but the sharpness of his intelligence made his eyes seem brighter. "We're maintaining relief routes in Africa and Europe. Our next area of focus is East Asia."

"There weren't any strikes there," Avasarala said.

"But they took the worst of the ash fall," Li said. "I have my people working out routes and probable needs. Information from the ground is sketchy."

"The Belt?" she said.

"The Belt's the Belt," Pycior said. "There's a wide variety of response. Ganymede is still maintaining neutrality, but it's firmly in the Free Navy's sphere of control. If we could offer protection, it would likely declare for

us. The OPA is divided. Tycho Station, Kelso Station, and Rhea are the only ones who've condemned the Free Navy. The Trojan stations and Iapetus aren't declaring anything. Most of the rest of the Belt ... It's for the Free Navy. As long as they keep promising food, material, and protection, it's going to be hard for moderate Belters to organize, even assuming they want to."

Souther cleared his throat. He spoke in a high voice that reminded her of singing. "We've taken apart the *Azure Dragon's* comm logs. They indicate that there's a high-level Free Navy meeting on Ceres right now. Inaros and his four captains."

"What are they meeting about?" Avasarala snapped.

"No one seemed to know," Souther said. "But we don't have evidence of a second shepherd vessel. We've identified seven more major rock strikes that are presently en route to Earth. We're tracking them, and we're ready to take them out."

Meaning they were unpinned. Avasarala leaned forward, pressing her fingers to her lips. Her mind danced across the solar system. Medina Station. Rhea, declaring against the Free Navy. The food and supplies of Ganymede. The starvation and death on Earth. The Martian Navy divided between the mysterious Duarte and his black market Free Navy and Smith. Now Richards. The lost colonies. Fred Johnson's OPA and all the factions he couldn't influence or command. The colony ships being preyed upon by the Free Navy pirates, and the stations and asteroids gaining the benefit of the piracy. And the missing ships. And the stolen protomolecule sample.

A dozen possibilities shifted in her mind—redeploy forces to Tycho Station and embolden Ganymede, or blockade Pallas and try to cut off the Free Navy's resupply capabilities, or set up a protected zone for the colony ships out there and running dark. There were a thousand different paths, and she couldn't be sure where any of them would lead. If she guessed wrong, it could mean the collapse of all that was left.

But Marco Inaros and his captains were together in one place, and her ships weren't pinned.

"Fortune favors the bold, yes?" she said. "Fuck it. Let's take back Ceres."

Chapter Eleven: Pa

Seven decades before Michio Pa was born, Earth and Mars rewrote the tariff regulations on raw ore from the Belt. The stated reason was that it would encourage the establishment and expansion of refineries in the Belt and around Jupiter and Saturn. It might even have worked. In the short term, it meant that a wave of Belter prospectors and asteroid miners who'd been living at the edge of survival slipped over into the abyss. Ships were impounded or run illegally or lost from not having the scrip to pay for maintenance and repair. Back then, Earth and Mars had walked in each other's footsteps, and the only option that seemed to have any promise of justice was for the Belt to build a military of its own.

It was never official. The Outer Planets Alliance survived since then by being diffuse and deniable. But the beginnings were there. Choose a faction, find a place in the chain of command, build the thin but resilient structure that would have muscle one day. That would eventually become an answer to the inner planets projecting their power out to where the sun was hardly more than the brightest star.

When Michio Pa turned twenty-two, Fred Johnson—the Butcher of Anderson Station—had seemed like her brightest hope. He was an Earther fighting for the Belt. Fighting against his own natural self-interest. It gave a sense of authenticity to someone young enough and still easily swayed. She'd taken a position on Tycho Station, made her contacts first and then her commitment. Trained in the quasi-military that Johnson was hauling up. Put in her years.

She'd been a true believer, then. She'd been a naïve little prig. But that was before the *Behemoth*.

Getting the XO assignment on the Belt's first genuine warship had been a dream come true for her. The generation ship hadn't been designed for war, but all of her crew had been. That was what she told herself.

Captain Ashford had the command. She had been his second. And slotted in beneath them as head of security, Fred Johnson's personal friend. Carlos C de Baca. Bull. Her babysitter, and the man positioned to step in and take over when she made her first mistake. Her hatred for Bull had been incandescent. Every chance she had to belittle him, she'd taken it. Every misstep he made, she drove a wedge into, prying it open. The *Behemoth* had gone to the ring to face down Earth and Mars. To show that the Belt was a force to be reckoned with. And as above, so below. She'd made it her personal mission to show Bull that she was better than he was.

Which was why it had hurt her so badly when Sam sided with him.

They'd talked about it, her and Sam. How important it was to keep their affair quiet. How not to let anyone—especially anyone in command—guess about them. Sam had agreed, maybe because she actually did agree. Or maybe in order to placate Michio's insecurities. And then Bull and Sam had fucked around with the budget allocations. It had felt like the deepest betrayal possible. Sam—*her* Sam—making common cause with an Earther. With the Earther who'd been sent by Fred Johnson to mind the untrustworthy Belters.

It had been only her first mistake among many. Michio had let her emotions blind her to the wisdom and experience that Bull had offered her until things were badly out of hand. Despite all the casualties after the catastrophe, she hadn't recognized Ashford's volatility and violence as symptoms of brain injury. She hadn't put aside her faith in the chain of command.

And she hadn't made peace with Sam before Ashford killed her.

Fred Johnson had sent her out into the whirlwind because she was a Belter, and he needed a Belter as a figurehead. She hadn't been ready, but she had been convenient. And because of it, people had died.

The *Behemoth* never came back through the gate. They'd stripped her down, spun up the drum, and rechristened her again as Medina Station. Michio Pa, they'd sent back to Tycho on a Martian naval vessel. After the dead had been removed, there'd been plenty of extra space. As soon as she'd gotten back to her quarters, she'd resigned. She didn't even shower first. She quit her official job on Tycho, her militia rank in the OPA, everything. Fred Johnson had sent her personal messages. She didn't know what was in them. She'd deleted them without listening.

And she'd gotten lost, taking one job and another. Trying to keep her nightmares and crying jags to herself. She ran a ship for a salvaging company that sometimes verged over into piracy. She oversaw a trading co-op that didn't announce itself to the tariff boards, which was technically smuggling. She was managing a supply warehouse complex on Rhea for a half-criminal labor union based out of Titan when Nadia and Bertold found her. It had taken six months before she'd realized that she was in love with them and four more before she understood what it meant that they loved her too. The day they first made a home together in a thin, inexpensive hole half a klick below the moon's surface was one of the best she'd ever had.

The others had come in their own way. Laura and Oksana together. And then Josep. Evans. Each new person folded into the marriage had felt like an expansion of her tribe. Her people. Not the politicians, not the war leaders, not the men who loved to wield power. There was a difference between, on the one hand, the Belt and its fight to exist in the face of the gate she'd helped open and, on the other, the voices and bodies of her family.

But the dream didn't die. Somewhere in the back of her mind, the idea of a Belter navy that could stand toe-to-toe with Earth and Mars and demand to be respected lay dormant but alive.

And so when Marco Inaros came with his proposal in hand, she'd heard him out. She was still remembered in Belter circles as the captain who'd stepped up in the slow zone. People respected her name. When the time came, he needed someone who would coordinate rounding up the colony ships he was keeping out of the slow zone and see that the supplies made it to Belters in need. Take from the rich inners and give to the poor of the Belt until things were even. Until they reached the utopia of the void.

But not yet. Now he just needed small favors. Moving some contraband through to Ganymede. Overseeing a prisoner transfer. Helping set up a band of hidden relays outside Jupiter. He had cultivated her with a grand vision and small steps.

And by *cultivated*, she might have meant *seduced*.

"How many ships do we have coming to Ceres?" he asked, walking beside her. The administrative levels of Ceres Station had the smell of living plants, the polished floors and walls that were meant as a boast. Michio felt a little out of place there, but Marco didn't. He managed to

make wherever he was feel like his natural habitat.

“Seven,” she said. “The closest’s the *Alastair Rauch*. It’s been braking for a while. Should hit dock in three days. The *Hornblower*’s the farthest, but Carmondy can up the burn if we need him to. I’m trying to have the fleet conserve reaction mass.”

“Good. That’s good,” Marco said, putting his hand on her shoulder. His guards stopped at the door to the conference room, and Michio started past them. Marco held her back. “We’re going to need to shift them.”

“Shift them?”

“Route them to other ports. Or run them dark and just let them be for a while.”

Michio shook her head. It wasn’t actual rejection as much as her body expressing her confusion. Half a dozen responses came to her: *They all need to refuel someplace* and *We have stations running low on food and fertilizer that are already coming here to get it* and *Are you kidding me?*

“Why?” she asked.

Marco’s smile was warm and charming. Excited and bright. She found herself smiling along with him without knowing why.

“Situation’s changed,” he said, and then walked into the conference room ahead of her. His guards nodded to her as she passed them, and she wondered for a moment where Marco’s son was.

The others were around the conference table. The wall where Marco had spent days outlining his vision of the future Belt had been cleared, and in its place, a picture of an ancient warrior. The man was dark-skinned with an ornate mustache and beard, a turban, a long, flowing white robe, a crimson sash with three swords tucked in it, and an ancient rifle cradled in one arm.

“You’re late,” Dawes said to Marco mildly as Michio took her seat. Marco ignored them both.

“Consider the Afghan,” Marco said. “Lords of the Graveyard of Empires. Even Alexander the Great couldn’t conquer these people. Every great power who attempted it exhausted themselves and failed.”

“But they barely had a functioning economy,” Sanjrani said. Rosenfeld touched the other man’s arm and put a finger to his own lips.

Marco paced before the image. “How did they manage it? How did a technologically primitive, scattered people defy the greatest powers in the world for century after century?” He turned to the others. “Do you know?”

None of them answered. They weren't meant to. This was a performance. Marco's grin widened. He lifted a hand.

"They cared about different things," he said. "To the enemy, war was about territory. Ownership. Occupation. To these geniuses, it was about controlling the spaces they did not occupy. When the English armies came to an Afghan city, ready to take the field of battle, they found ... nothing. The enemy faded into the hills, lived in the spaces that the enemy discounted. For the English, the city was a thing to be owned. For the Afghan, it was no more sacred than the hills and the desert and the fields."

"That's a bit *romantic*, don't you think?" Rosenfeld said, but Marco ignored him.

"These brave people. They were the Belters of their age and place. Our spiritual fathers. And the time has come for us to honor them. My friends, the *Azure Dragon* has fallen, as we knew it would eventually. Earth is preparing to lash out in its pain and ignorance."

"You've heard something?" Dawes asked. His face was pale.

"Nothing new," Marco said. "We always knew that Ceres was a target for them. They've been biding their time since the OPA's takeover, but our cousin Anderson here was always careful to balance his power with appeasement. It was never their greatest concern. Not until now. The UN Navy is redeploying. They are heading for Ceres. But when they get here ...?"

Marco lifted his two closed fists to his mouth, then blew on them and spread his fingers. It was an illusion, but Michio felt she could almost see the ashes blowing off his hands.

"You can't mean ..." Dawes choked.

"I've already started the evacuation," Marco said. "All our soldiers and materiel will be off the station well before they arrive."

"There are six million people on the station," Rosenfeld said. "I don't know that we can take them all."

"Of course not," Marco said. "This is a military action. We take the military ships and supplies that we need, and cede the territory to Earth. They won't let Ceres starve and die. The only thing they have is the chance to play victim and wring sympathy out of the simpleminded. If they don't take care of Ceres, they'll lose even that. And us? We'll be in the emptiness that is our natural home. Unassailable."

“But,” Sanjrani said. Almost whined. “The *economic* base.”

“Don’t worry,” Marco said. “Everything we’ve discussed is coming. Only first, we have to let the enemy overextend itself and collapse. This was always part of the plan.”

Dawes rose to his feet. His face was gray as ash apart from two bright red smears on his cheeks. His hands shook. “This is about Filip. You’re getting back at me?”

“This isn’t about Filip Inaros,” Marco said, but the elation and excitement had vanished from his voice. “This is about Philip of Macedon. And about learning the lessons of history.” He was silent for a long, terrible moment. Dawes sank back into his chair. “Now. Michio and I have already discussed rerouting the incoming ships. Let’s talk about the logistics of emptying the station itself, yes?”

The way that inners fled their own ships when they came to a station fed a certain species of jokes among Belters. How can a Belter choose a ship’s dinner menu? Dock. How can you tell an Inner’s been away from port too long? They go outside to shit. If you give an Earther the choice of staying on board ship and saving her sweetheart’s life or heading out to the docks and never loving again, how do you dispose of the body? It was the way they looked at everything: The ship wasn’t real, the planet was. Or the moon. Or the asteroid. They couldn’t let go of the idea that life involved rock and soil. It was what made them smaller.

Michio’s people weren’t all on the *Connaught* when she passed through the docking tube and into her ship’s lock, but most were. The ones who were out would likely come back to sleep in their bunks. No one would think it was odd that her whole marriage group was there. Or if it was a little odd, not implausible at least.

She headed down the lift with the weird sense of seeing the ship for the first time. Like stepping into a new station, everything was in sharp focus. Unfamiliar. The green and red indicators of the lift control. The thin, white text printed on every panel to show what was housed behind it and when it had been installed. The subtle MCRN logo still visible on the floor despite

their best efforts to buff it away. The smell of black noodles came from the galley, but she didn't pause. If she tried to eat now, she'd only vomit anyway.

They were in the cabins set aside for the family. One of the first things Bertold had done when they got the *Connaught* was take the walls off three of the cabins to make a wider space with crash couches enough that they could all sit together. The Martian designers had made the ship so that people could be alone or else together. It took a Belter to make space to be alone together. Oksana and Laura were sitting on the deck, their harps almost touching as they played through an old Celtic melody. Oksana's paleness and Laura's dark made them seem like something from a fairy tale. Josep lounged in one of the couches, his hand terminal set to some text or another, reading and swaying his foot to the music. Evans sat beside him, trying not to seem nervous. Nadia, looking like the however-many-greats-granddaughter of Marco's Afghan soldier, stood behind one of the other couches, gently massaging Bertold's thinning black hair.

Michio sat in the couch they'd left for her and listened until the melody came to an end in a series of ambiguous fourths and fifths. They put down their harps and hand terminal. Bertold opened his one good eye.

"Thank you for coming," Michio said.

"Always," Laura said.

"Just to ask," Josep said. "Are you our captain or our wife right now?"

"I'm your wife. I think ... I think that I ..."

And then she was weeping. She leaned forward, hands over her eyes. The tight monkey's-fist knot that was her heart blocked her throat. She tried to cough it out of the way, but it sounded like a sob. Laura's hand touched her foot. And then Bertold's arm was across her back and he folded her in against him. She heard Oksana murmuring, "It's okay, baby. It's all right," from what might have been half a world away. It was too much. It was all too much.

"I did it," Michio managed at last. "I did it again. I put us in Marco's control, and he's ... He's another Ashford. He's another Fred fucking Johnson. I tried so hard not to do it again, and I did it. And I brought you all along. And I'm so ... I'm so *sorry*."

Her family descended on her gently, a hand or an arm, all of them touching her. Offering her comfort. Saying wordlessly that they were there.

Evans wept with her, not even knowing why. The tears got worse for a while, confused for a while. And then better. Clearer. The worst of it passed. And when she was herself again, it was Josep that spoke.

“Tell us the story. It’ll have less power then.”

“He’s abandoning Ceres. Getting all the Free Navy out and leave the people for the inners. The colony ships we took? He wants to drive them dark out of the ecliptic for storage instead of delivering the supplies.”

“Ah,” Nadia said. “That kind, is he?”

“It’s hard, changing,” Josep said. “Tell yourself you’re a warrior long enough, you start believing it. Then peace looks like death. An annihilation of self.”

“Little abstract, honey,” Nadia said.

Josep blinked wide eyes at her, then smiled ruefully. “More concrete. You’re right. You always are.”

“I’m so sorry,” Michio said. “I did it wrong again. I trusted someone. I put myself in his command, and ... I’m stupid. I’m just stupid.”

“We all agreed,” Oksana said through a scowl. “We all believed.”

“You believed because I asked you to,” Michio said. “This is my fault.”

“Now,” Laura said, “Michi? What’s the magic word?”

Against her will, Michio laughed. It was an old joke. A part of what made her family her family.

“The magic word is *oops*,” she said. And then a moment later, “Oops.”

Bertold took a moment to noisily blow his nose and wipe the last of the tears from his eyes. “All right. So what do we do?”

“We can’t keep working with the bastard,” Oksana said.

Nadia nodded with her hand. “And we can’t stay here and wait for the Earthers.”

Together, without meaning to, they all looked to her. Michio, their wife. But also their captain. She took a long, shuddering breath. “The thing he asked us for? Gather up the colony ships and spread the food and supplies to the Belters that need them? It still needs doing. And we still have a gunship to do it with. Some of the other ships might see things our way. So either we stick to the mission or else we try to find someplace quiet and sink out of sight before Inaros figures that we’re gone.”

Her family was silent for what felt like a long time, though it wasn’t more than a few breaths set end to end. Bertold scratched at his bad eye.

Nadia and Oksana traded a look that seemed to mean something. Laura cleared her throat.

“Being small isn’t being safe. Not now.”

“Vrai,” Bertold said. “I’m for doing what we said we’d do, and fuck the rest. Changed sides before and it didn’t kill us.”

“Did we?” Josep said. “Would we be changing sides now?”

“Yes,” Evans said. “We would.”

Josep turned to look Michio full in the eyes. The humor and love in his face was like warmth radiating from a heater. “Fought the oppressor before. Still fighting the oppressor now. Followed your heart then. Still following your heart now. The situation changes, that doesn’t mean you do.”

“That’s sweet,” Michio said, taking his hand.

“Abstract, though,” Nadia said, and there was love in her voice too.

“Everything you’ve done,” Josep said, “every mistake, every loss, every scar. They all brought you here, so that as soon as you saw Big Himself for what he is, you’d be ready to act. Incapable of *not* acting, even. Everything then was preparation for now.”

“That’s bullshit,” Michio said. “But thank you.”

“If the universe needs a knife, it makes a knife,” Josep said with a shrug. “If it needs a pirate queen, it makes Michio Pa.”

Chapter Twelve: Holden

The wall screen in the dock's public lobby was tuned to an entertainment newsfeed. A breathtakingly pretty young woman with one eyelid that was either rouged or tattooed red was being interviewed by someone off screen. The crawler at the bottom of the screen identified her as Zedina Rael. Holden wasn't sure who she was. The sound was on, but incomprehensible over the sound of the people moving through the lobby to or from the docks. The subtitles were in Hindi. On the screen, Rael shook her head, and a thick tear dripped down her cheek as the feed shifted to images of a ruined city under a filthy brown sky. So something about the situation on Earth.

It was easy to forget that the entertainment feeds—musicians and actors and celebrities-for-the-sake-of-celebrity—were all going to be as affected by the catastrophe as everybody else. It felt like that slice of reality should be separate. Inviolable. Plagues and wars and disasters weren't supposed to impinge on the manufactured world of entertainment, but of course they did. Zedina Rael, whatever she did that got her a place on the screen, was a human being too. And had probably lost someone she loved when the rocks fell. Would probably lose more.

"Captain Holden?" The man was thick-shouldered and dark-haired with a sharp goatee. He carried an air of exhaustion and good humor along with his hand terminal. His uniform identified him as Port Control and his name badge read Bates. "Sorry there. You been waiting long?"

"Nope," Holden said, taking the proffered terminal. "Just a few minutes."

"Things are busy," Bates said.

"Not a problem," Holden said as he signed and pressed his thumb to the reader pad. The terminal chimed. It was a small, happy sound. Like the terminal was very happy Holden had authorized the delivery.

"Got you in bay H-15?" Bates said. "We'll have that unloaded for you

right away. Who's your repair coordinator?"

"We've got our own," Holden said. "Naomi Nagata."

"Right. Of course," the man said, nodded once, and was gone. On the screen Zedina Rael had been replaced by a thick-featured Ifrah McCoy. At least Holden knew who she was. The invisible interviewer said something, and a lull in the background noise let him hear the answer: *There must be a response. We have to stand up.* The frustration and pain in McCoy's voice bothered him, and he didn't know if it was because he agreed with her or because he was afraid what that response would lead to. He turned back toward the docks proper and the work at hand.

In a spin station like Tycho or the Lagrange stations, the ship would have been parked in vacuum. Luna was another thing entirely. The shipyard had vast locks dug deep into the lunar body with tugs to guide ships in and out, retractable seals, air. The *Rocinante* stood upright, drive cone toward the center of the moon and chisel-tip upper decks toward the stars, held in a webwork of scaffolding. The space was large enough to house a ship three times her size, and all of it was filled with breathable air.

Racks of construction mechs stood against the wall except for the four that were on the *Rocinante*, crawling gently over its surface like spiders on a crow. Naomi was in one, Amos in another. The third was Sandra Ip, one of two engineers who Fred Johnson had brought on as the *Roci*'s crew for the flight to Luna when the real crew—less Holden—had scattered to the void.

Alex and Bobbie stood on a raised platform, looking up at the body of the ship. The damage the Free Navy had done was knotted as a scar, and bright. Wide panels—the newly delivered sections of hull—rose up the ship and scaffold, guided by massive waldoes. Alex held out a headset, and Holden connected it to his hand terminal, shifting to the full-crew channel.

"How's it looking?" he asked.

"They did a number on us," Naomi said. "I'm impressed."

"Always easier to break things than put them together," Holden said.

"More evidence for that," Naomi agreed with a Belter nod of the fist. "And these replacement sections ..."

"Problem?"

Sandra Ip's voice answered. It was a little jarring to hear an unfamiliar voice. "They're carbon-silicate lace. State-of-the-art. Lighter, stronger.

These things can deflect a glancing PDC round.” Defensiveness just below the surface told Holden this wasn’t the first time through the conversation.

“They can for now,” Naomi said. Holden switched his mic to the *Rocinante*-only channel, but kept listening on the full crew.

“So, just between the family here? What’s the issue with the new plates?”

“Nothing,” Naomi said. “They’re great. Everything it says on the tin. But five years from now? Ten?”

“They don’t age well?”

“Well, that’s the thing,” Alex drawled. “Ain’t none of this stuff ten years old yet. The materials-science folks got a kick in the pants after the protomolecule. Bunches of new toys. Lace plating’s just one. In theory, it should hold up just like the real thing. In practice, we’re the practice. I had a hell of a time convincing the *Roci* I wasn’t putting in the wrong mass for them too. It’s going to change how she handles.”

Holden crossed his arms. Above him, the waldoes shifted the new hull section in, laying it along the *Roci*’s side. “Are we sure we want to do this? We can hold out for the regular kind.”

“Not if we want to get out to Tycho anytime soon, we can’t,” Naomi said. “There’s a war on.”

“We can turn down the contract,” Holden said. “Fred can find another ride.”

“I don’t know, Cap,” Amos said. “Things being what they are, I kind of like that we’re getting work. I mean, as long as money still works.” He paused. “Hey, does money still work?”

“It does if we win,” Naomi said. “Free Navy ports weren’t going to refit and refuel us anyway.”

“Right,” Amos said. “So I kind of like that we’re getting work.”

Two of the mechs scuttled forward to the edge of the new hull plate. Welding torches like little suns burst into life, cleaving old technology and new together. There was something about it that Holden disliked and distrusted. But there was also something amazing. The very fabric the lace hull was made from hadn’t existed when he was born, and now it did.

Vast intelligences had designed the protomolecule, the rings, the weird and implacable ruins that covered all the new worlds. They might be extinct, but they were also being incorporated into what humanity knew,

what it could do, how it defined itself. A kid born today would grow up in a world where carbon-silicate lace was as common as titanium or glass. That it was a collaboration between humanity and the ghosts of a massive and alien intelligence would go right by them. Holden was one of the lucky generation who would straddle that break point, that seam between before and after that Naomi and Amos and Ip were making literal right now, and so he could be amazed by how cool it was. Creepy, but cool.

“It’s the future,” he said. “We might as well get some practice with it.”

The rest of Fred Johnson’s temporary crew were either already on the *Rocinante* along with Clarissa or on the way from their quarters on Luna. There was an excitement about the coming action. It was the first time that they—Earth, Mars, and even the less radical splinters of the OPA—would work together to take any direct action against the Free Navy. The heavy lifting would be done by Earth and Mars, but the *Rocinante* would be there. An observation ship carrying Fred Johnson. A representative, however imperfect, of the Belt. They were ready.

Except that Holden also wasn’t.

Especially now that his parents had come up the well from Earth, the impulse to stay close surprised him. He’d spent most of his adult life off-planet. If anyone had asked, he’d have told them that he didn’t miss Earth. Some people, yes. Some places from his childhood, maybe. But there’d been no sense of longing for the planet itself. It was only now that it had been attacked that he wanted to protect it. Maybe it was always like that. He’d outgrown his childhood home, but in the back of his mind, the unexamined assumption was that it would still be there. Changed, maybe. Grown a little older. But there. Only it wasn’t now. Wanting to stay was the same as wanting to go back a little in time to when it hadn’t happened.

Fred Johnson sent a message. He and weapons technicians Sun-yi Steinberg and Gor Droga were finishing their last meeting. As soon as the new hull was welded into place and the pressure tests complete, they could go. If Holden had any last business on Luna, this was the time for it.

He had some last business on Luna.

The torches flared and died and flared again. The *Rocinante* was remade a little, the same way it had been over and over through the years. Little changes adding up over time as the ship moved from what it had been to what it would be next. Just like all the people she carried.

“You okay?” Bobbie asked.

“What?” Holden said.

“You were sighing,” she said.

“He does that sometimes,” Alex said.

“I do?” Holden said, realizing as he did that Bobbie was still looped in on the *Rocinante*-only channel. That he was glad she was. “I didn’t know I did that.”

“Don’t worry about it,” Naomi said. “It’s cute.”

“So,” he said. “When you’re done with that, Naomi? Fred’s on his way.”

“Yeah,” she said, and he was probably just imagining the dread in her voice. “All right.”

The cart that drove them down toward the refugee station ran on electromagnetic track that held the wheels to the ground. Part-grumble, part-chime, the sound was loud enough that Holden felt he had to raise his voice a little to be heard over it.

“If she’s still being paid through the UN or Mars, that would be different,” Holden said. “If we’re offering her a place on the ship permanently, I just think we need to be careful about how we do it.”

“She’s good,” Naomi said. “She’s actually trained for a ship like the *Roci*, which is more than any of us can say. She gets along with the crew. Why wouldn’t you want Bobbie on board?”

The air in the deeper corridors was damp and close. The environmental systems were working at their full capacity, and a little bit more. People shuffled out of the cart’s way, some staring at them as they passed, some not seeming to look at anything.

The refugee station stank of loss and waiting. Almost every person they passed was a lifetime that had been severed from its roots. Holden and Naomi were the lucky ones here. They still had their home, even if it was a changed one.

“It’s not Bobbie,” Holden said. “Of course I want Bobbie. But the terms ... Do we pay her? Do we redistribute ownership of the *Roci* so that she’s got the same stake in her that all of us do? I’m not sure that’s a good idea.”

Naomi looked at him, her eyebrows rising. “Why not?”

“Because whatever we do with Bobbie sets the precedent for what we do with any other crew we bring on.”

“Meaning Clarissa.”

“I don’t want to give Clarissa Mao ownership of the *Roci*,” Holden said. “I just ... She’s here, and okay, fine. I’m still not sanguine about that, but I can deal with it. And I want to bring Bobbie all the way into the crew, but I just—I can’t. I can’t agree that Clarissa ever gets to call my ship her home. There’s a difference between letting her be there and pretending she’s like Bobbie. Or you. Or me.”

“No forgiveness?” Naomi asked, halfway between teasing and serious.

“Plenty of forgiveness. Loads of forgiveness. Some boundaries too.”

The cart lurched to the left, slowed. The chiming sound cycled lower as it stopped. Father Anton was waiting at the door, smiling and nodding to them as they lifted themselves out and bounce-shuffled forward. The quarters for Holden’s parents were better than most. The suite was tight and too small, but private. His mothers and fathers didn’t have to share it with anyone outside the family. Mother Tamara’s yellow curry scented the air. Father Tom and Father Cesar stood in the doorway to one of the bedrooms, arms around each other’s hips. Father Dimitri leaned against the arm of an old sofa, while Mother Elise and Mother Tamara came in from the little kitchen. Father Joseph and Mother Sophie sat on the couch, a thin magnetic chess set between them, the pieces scattered by their game. Everyone was smiling, including him, and none of them meant it.

It was goodbye again. When he’d left for his doomed tour in the Navy, there’d been a moment like this too. A leave-taking that meant something they couldn’t be sure of. Maybe he’d be back in a few weeks. Or never. Maybe they’d be here on Luna, or transfer to L-4. Or something else might happen. Without the farm and decades of social inertia to hold them together, maybe they would break apart. A sudden, oceanic sadness washed through Holden, and he had to fight to keep it from showing. Protecting his parents from his distress one more time. Just the way they were doing for him.

One by one, and then in groups, they hugged. Mother Elise held Naomi’s hand and told her to take care of her little boy. Naomi solemnly agreed that she’d do what she could. If this might be the last time he had his

parents all together, he was grateful that Naomi was there to be part of it, right up until Father Cesar said goodbye.

Cesar's skin was wrinkled as a turtle's, dark as fresh-turned earth. There were tears in his eyes as he took Holden's hand. "You did good, boy. You made everyone proud of you."

"Thank you," Holden said.

"You go give those fucking *skinnies* hell, yeah?"

Over Cesar's left shoulder, Naomi went stiff. Her smile, which had been soft and warm and amused, became polite. Holden felt it like a punch in the gut. But Cesar didn't even seem to know that he'd said something rude. Holden was trapped between asking his father to apologize and preserving this last moment. Naomi, talking to Mother Tamara, plucked at her hair. Pulled it over her eyes.

Shit.

"You know," Holden said. "That's—"

"That's what he'll do," Naomi said. "You can count on Jim."

Her eyes were on his, and they were hard and dark. *Don't make this more awkward than it already is* glowed in them as clearly as if she'd written it. Holden grinned, hugged Father Cesar one last time, and started the retreat to the door, the cart, the *Rocinante*. All eight of his parents crowded outside the door to watch him go. He felt them there even when the cart turned the corner and started up the ramp toward the docks. Naomi sat silently. Holden sighed.

"Okay," he said. "I see now why you didn't want to do that. I'm really sorry that—"

"Don't," Naomi said. "Let's don't."

"I think I owe you an apology."

She shifted to look straight at him. "Your father owes me an apology. One of your fathers. But I'm going to let him off the hook."

"All right," Holden said. The cart lurched to the right. A man with a thick beard trotted out of their way. "I was going to defend you."

"I know you were."

"Just ... I would have."

"I know. And then I would have been the reason that everything had gotten weird, and everyone would have gone out of their way to tell me how they respect Belters and how he didn't mean *me*. And you're their son,

and they love you. And they love each other. So no matter what anyone said, it would all have been my fault.”

“Yeah,” Holden said. “But then I wouldn’t feel as bad about it. And I feel kind of bad about it.”

“Cross you’ll have to bear, sweetie,” Naomi said. She sounded tired.

At the dock, Fred Johnson’s crew was loading the last of the supplies into the cargo airlock. The new lace hull panels stood out on the *Roci*’s side like scars. The cart, having dropped them off, rumbled and chimed itself away. Holden paused for a moment, looking up at the ship. His heart was complicated.

“Yeah?” Naomi said.

“Nothing,” Holden said. And then, a moment later, “There was a time I thought things were simple. Or that at least some things were.”

“He didn’t mean me. No, really. He didn’t. Because I’m a person to him, and skinnies and Belters ... they aren’t people. I had friends on the *Pella*. Real friends. People I grew up with. People I cared about. People I loved. They aren’t any different. They didn’t kill *people*, they killed Earthers. Martians. Dusters. Squats.”

“Squats?”

“Yup.”

“Hadn’t heard that one.”

She put her hand in his, shifted her body against his, reached up to rest her chin on the top of his head. “It’s considered rude.”

Holden leaned against her as much as the weak gravity would allow. He felt the warmth of her body against his. Felt the rise and fall of her breath.

“We’re not people,” he said. “We’re the stories that people tell each other about us. Belters are crazy terrorists. Earthers are lazy gluttons. Martians are cogs in a great big machine.”

“Men are fighters,” Naomi said, and then, her voice growing bleak. “Women are nurturing and sweet and they stay home with the kids. It’s always been like that. We always react to the stories about people, not who they really are.”

“And look where it got us,” Holden said.

Chapter Thirteen: Prax

The thing that surprised him the most when it all changed was how little it all changed. At least in the beginning. Between the trailing end of the reconstruction and the rising tide of research projects, Prax sometimes went days or weeks without looking at newsfeeds. Anything interesting in the greater sphere of humanity, he heard about in the conversations of others. When he'd heard that the governing board was putting out a declaration of neutrality, he'd thought it was about gas sequestration and exchange. He hadn't even known there was a war until Karvonides told him.

Ganymede knew too much about being a battlefield already. The collapse was too recent in their collective memory, the scars still fresh and raw. There were ice-flooded corridors still unexcavated after the last outbreak of violence, back before the ring gate, back before the opening of the thirteen hundred worlds. No one wanted that again. And so Ganymede said it didn't care who ran things, just so long as they could continue their research, care for the people in their hospitals, and go about their lives. A massive *We're busy, you figure it out* to the universe in general.

And then ... nothing. No one claimed them or threatened them. No one fired nukes at them, or if they had, the weapons hadn't landed and the event hadn't made the news. So much of Ganymede's food was locally sourced, no one worried about going hungry. Prax had some concerns about research funding, but after the first few times he brought it up and had the issue swept aside, he'd stopped trying. They were in a holding pattern. They were keeping their heads down, doing the things they'd always done, hoping no one took notice.

And so Prax's daily trip between his hole and Mei's school and his offices had been weirdly unchanged. The food carts in the station served the same fried corn mash and bitter tea. The project-management meetings continued on Mondays before lunch. The generations of plant and fungus

and yeast and bacteria lived and died and were analyzed just the way they would have been if no one had crippled Earth. Or killed it.

When Belters in Free Navy uniforms started appearing on the corners, no one said anything. When the Free Navy ships had started demanding resupply, their scrip had been added to the approved list of currencies and their contracts drawn up. When loyalists who'd filled their boards and feeds with support for Earth and demands that the governing board take a stand went silent, no one talked about it. It was just understood. Ganymede's neutrality was permitted so long as the Free Navy could enforce it. Marco Inaros—who Prax had never heard of before the rocks fell—might not control the base, but he was quite willing to prune away the people who did until the organizational chart had been bonsai'd into the shape that pleased him. Pay tribute to the Free Navy, and govern yourself. Rebel, and be killed.

So nothing much changed and also everything did. The tension was there every day. In every interaction, however mundane. And it came out at strange times. Like reviewing trial-report data.

"Fuck the animal trials," Karvonides said, her face tight and angry. "Forget them. This is ready to go into production."

Khana crossed his arms, scowling at her. Prax, confused, had only the data to turn to, so he turned to it. Harvester yeast strain 18, sequence 10 was doing very well. The production numbers—sugars and protein both—were slightly above expected. Lipids were inside the error bars. It had been a good run. But ...

His office was spare and close. The same room he'd taken when he'd brought Mei back from Luna. The first office of his tenure on the Reconstruction Committee. The others on the committee had moved on to larger places with bamboo paneling and augmented-spectrum lights, but Prax liked being where he already was. The familiar had always offered a powerful comfort. If Khana and Karvonides had worked in any other section, there would have been a couch or at least soft chairs for them to sit on. The lab stools in Prax's office were also the same ones he'd had his first day back.

"I ..." Prax said, then coughed, looked down. "I don't see why we'd break protocol. That seems ... um ..."

"Completely irresponsible?" Khana said. "I think the phrase is

completely irresponsible.”

“What’s irresponsible is sitting on this,” Karvonides said. “Two additions to the genome, fifty generations of growth—so less than three days—and we have a species that can beat chloroplasts for making sugars out of light and extends out almost into gamma. Plus the proteins and micronutrients. Use this for reactor shielding and you can shut down the recycler.”

“That’s hyperbole,” Khana said. “And this is protomolecule technology. If you think—”

“It is not! There is literally nothing in Hy1810 that comes from an alien sample. We looked at the protomolecule, said *It can’t do that; can we?* and figured out how to make something of our own. Native proteins. Native DNA. Native catalysts. Nothing that traces back to Phoebe or the ring or anything that came off Ilus or Rho or New London ever touched this.”

“That ... um,” Prax said. “That doesn’t mean it’s safe, though. The animal protocol—”

“Safe?” Karvonides said, wheeling on him. “There are people starving to death all over the Earth right now. How *safe* are they?”

Oh, Prax thought. This isn’t anger. It’s grief. Prax understood grief.

Khana leaned forward, his hands in fists, but before he could speak, Prax put up his palm. He was in charge here, after all. It didn’t hurt to actually exercise his power now and then.

“We’ll continue with the animal protocol,” he said. “It’s better science.”

“We could save lives,” Karvonides said. Her voice was softer now. “One message. I have a friend at Guandong complex. She’d be able to replicate it.”

“I’m not going to be part of this conversation,” Khana said. The door slammed closed behind him so hard that the latch didn’t hold. The door ghosted open again, like someone invisible was coming in to take his place.

Karvonides sat, her hands on Prax’s desk. “Dr. Meng, before you say no, I want you to come with me. There’s a meeting tonight. Just a few people. Hear us out. Then, if you really don’t want to help, I won’t bring it up to you again. I swear.”

Her eyes were dark enough it was hard to tell iris from pupil. He looked back down at the data. She was probably right, in her way. Hy1810 wasn’t the first yeast that had been modified with radioplasts, and Hy1808 and

most of the Hy17 runs had been in animal trials for months without any statistically significant ill effects. With things on Earth as bad as they were, the risk of Hy1810 having adverse effects was almost certainly lower than the dangers of starvation. His stomach felt tight and anxious. He wanted to leave.

“It’s proprietary,” he said, hearing the whine in his voice as he said it. “Even if we could ethically release it, the legal consequences, not just for us but for the labs in general, would be—”

“Just come hear us out,” Karvonides said. “You won’t have to say anything. You won’t even have to talk.”

Prax grunted. A little chuffing sound that centered behind his nose. Like an angry rat.

“I have a daughter,” he said.

The silence between them went on for the space of a breath. Then another. Then, “Of course, sir. I understand.”

She stood up. Her stool scraped against the flooring. It sounded cheap. The urge to say something fluttered in his chest, but he didn’t know what it would be, and before he found it, she was gone. She closed the door more gently than Khana had, but with a greater finality. Prax sat, scratching at his arm though it didn’t itch, then he closed the report.

The rest of the day was filled with his own work in the hydroponics labs. His new project was a modified fern built for water and air purification. They stood in long rows, fronds bobbing in the constant and well-regulated breeze. The leaves—so green they were almost black—smelled familiar and welcoming. The embedded sensors had been gathering data since the day before, and he looked it over like sitting with an old friend. Plants were so much easier than people.

When that was done, he stopped back by his office, returned half a dozen messages, and reviewed the meetings scheduled for the next morning. It was all routine. All the same things he’d done before the rocks hit Earth. It was like a ritual.

Today, though, he took the extra step of adding an administrative lock on the Hy1810 data. He tried not to think too much about why he’d done it. Something vague fluttered in the back of his mind about being able to show he’d done all he could do. He wasn’t sure who he imagined he’d be defending himself before, but he didn’t really want to think about that.

He felt nervous during his walk to the tube station. The pale tile walls, the arching ceiling above the platform. All of it was just as it had been ever since the rebuild. It only seemed ominous because of all the things in his own head. While he waited for his tube, he bought a wax-paper cone of fried bean curd with olive oil and salt. The vendor was an Earther, and Prax noted the way the man had kept his hair and beard long, letting them grow out from his skull to mimic the slightly larger heads of true Belters. The man's skin was dark, so the OPA tattoos on his hands and neck didn't stand out as much as they could have. *Cryptic coloration*, Prax thought as the chime announced the tube's arrival. *Probably a good idea*. It was interesting to see how humanity adopted the strategies you saw anywhere in nature. They were part of nature, after all. Red in tooth and claw.

Mei was already home when he got there. Her voice gabbling with and over the slightly higher tones of Natalia's came in from the playroom like music. Prax relocked the door behind him and went to the kitchen. Djuna, making salad for their dinner and reading something off her hand terminal at the same time, paused both activities to smile her greeting. He kissed her shoulder before going to the little refrigerator and plucking out a beer.

"Isn't it my turn to make dinner?" he said.

"You agreed to take tomorrow because of my late meeting—" Djuna started, then stopped when she saw the beer in his hand. "One of those days?"

"It was fine," he said, but he didn't even convince himself. Part of him thought he should tell her, but that was selfish. Djuna had her own burdens and her own work. She wouldn't be able to do anything about Karvonides or Hy1810. If she couldn't fix it, there was no call to burden her. Besides which, then if anyone asked, she'd be telling the truth when she said she didn't know anything.

Over dinner, they talked about the safer parts of work. His plants, her biofilms. Mei and Natalia were having one of their good days when they seemed more like best friends than stepsisters, and they took turns talking about all the things that had happened at school. David Gutmansdottir had gotten sick from the new lunches and had to go to the nurse, and the math test was late, and they'd gotten exactly the same score, but it was all right because they'd missed different questions, so Mr. Seth knew it wasn't that they cheated, and anyway tomorrow was Dress-in-Red Day, and they both

had to make sure to put out the right clothes before bed and ...

Prax listened to them running together, leaping subject over verb over object like they were running downhill. Natalia had Djuna's brownness, high cheekbones, and thick nose. Beside her, Mei looked as pale and round as old pictures of Luna. After dinner, it was Mei's turn to clean up, and Prax helped her a little. The truth was, she didn't need it. But he enjoyed her company, and it wouldn't be long before she was old enough to start differentiating from the family unit. Then it was homework hour for all of them, and then baths and then beds. Mei and Natalia stayed up talking across their bedrooms to each other until Djuna shut the connecting door. Even then, the two girls talked, like they had to burn through their buffers before sleep could finally come.

Prax lay beside Djuna, his arm as a pillow, and wondered where Karvonides was. If her meeting had gone well. If he hoped it had or not. Maybe he should have accepted her invitation. Even if it was only so that he could know what was going on ...

He didn't notice that he was falling asleep until the door chime woke him. Prax sat up, disoriented. Djuna was looking at him, her eyes wide and round and frightened. The chime came again, and his first nearly coherent thought was that he should answer before they woke the girls.

"Don't go," Djuna said, but he was already lurching across the bedroom. He grabbed his robe, knotting the belt as he stumbled into the dimness of the rooms. The system readout said it was just after midnight. The chime came again, and then a deep, soft knocking, like a massive fist using only a fraction of its power. He heard Mei cry out, and knew from long experience that the sound meant she was still asleep, but wouldn't be for long. The skin on Prax's flank puckered into goose bumps that only had a little to do with the temperature of the air.

"Who's there?" Prax said through the closed door.

"Dr. Praxidike Meng?" a man's muffled voice asked.

"Yes," Prax said. "Who is it?"

"Security," the voice said. "Please open the door."

Which security? Prax wanted to ask. Ganymede Station security or Free Navy? But it was too late now. If it was Station, it made sense to open the door. If it was Free Navy, it wouldn't stop them if he didn't. What he was going to do next was the same either way.

“Of course,” he said, then swallowed.

The uniforms of the two men in the hall were gray and blue. Station security. The relief that flooded his bloodstream was evidence of how frightened he’d been. How frightened he *always* was these days.

“Can I help you?” he asked.

The morgue smelled like a lab. The chemical reek of the phenol soap bit at his sinuses. The throbbing hum of the high-use air filters. The clinical lights. It reminded him of his years at upper university. He’d taken a cadaver lab then too. The body he’d dissected had been suffused in preservative fluids, though. Not as fresh. And it had been in better condition.

“The identification’s solid,” one of the security people said. “Metrics and markers sync up. ID matches. But you know how it is. No relatives on the station, and the union has rules.”

“Does it?” Prax asked. He meant the question honestly, but when he said it out loud, the words took on nuances he hadn’t intended. Can a union still matter when there’s barely a government any longer? Are there still rules? The security man grimaced.

“It’s the way we’ve always done it,” he said, and Prax heard the defensiveness in the man’s voice. The hint of anger. As if Prax was responsible for all the changes they were suffering.

Karvonides lay on the table, her modesty maintained by a black rubber sheet. Her expression was calm. The wounds on her neck and the side of her head were complicated and ugly, but the lack of fresh blood gave the illusion that they weren’t serious. They’d shot her four times. He wondered if the others from her meeting were in other rooms, on other tables, waiting for other witnesses.

“I’ll attest,” he said.

“Thank you,” the other security man said, and held out a hand terminal. Prax took it, pressed his palm to the plate. It chirped when it was done recording him, a weirdly cheerful sound, given the circumstances. Prax handed it back. He looked at the dead woman’s face, waiting to understand

what he felt about her. He had the sense that he should cry, but he didn't feel like it. In his mind, she'd become evidence not of a crime but of what the world had become. Her death wasn't the beginning of an investigation, but the conclusion of one. The data was unambiguous. What happens when you stand up? You're cut down.

"Can we ask you a few questions about the deceased, Dr. Meng?"

"Of course."

"How long have you known her?"

"Two and a half years."

"In what capacity?"

"She was a researcher in my labs. Hmm. I'll have to make sure her datasets get collected. Can I make a note of that? Or do I need to wait until the interrogation's done?"

"This isn't an interrogation, sir. You go right ahead."

"Thank you." Prax pulled up his hand terminal and put an entry on his list for the morning. He thought at first there was something wrong with the display, but it was only his hand trembling. He shoved the terminal back in his pocket. "Thank you," he said again.

"Do you have any idea who might have done this to her? Or why?"

The Free Navy did this to her, Prax thought. They did it because she was trying to stand against them. She was doing that because people are suffering and starving and dying that might not have to, and she had it in her power to make a difference. They found out, and they killed her. The way they'd kill me if I made things uncomfortable for them.

He looked into the security man's inquiring eyes. *The way they'd kill you too,* he thought.

"Anything you can offer on the question, sir? Even something small might help."

"No," Prax said. "I don't have any idea."

Chapter Fourteen: Filip

The docks of Ceres Station ran, roughly speaking, along its equator in a wide belt of titanium and ceramic and steel. The dwarf planet's movement made docking difficult, but once the clamps took hold, ships had the advantage of the 0.3g of spin gravity even with the drive off and cold. And with the radius of spin as big as it was, the Coriolis should have been negligible. The *Pella* should have felt like it was under a moderate burn and nothing more, but something kept bothering Filip. A sense that the ship was wrong, or that he was.

Twice, he snuck into the medical bay and had diagnostics run, then deleted the results after he read them. They didn't show anything anyway. But maybe he was just so used to life under thrust that the trace of sideways impulse was enough to unsettle him. Or maybe it was only that the ship was empty except for him. A small, gnawing part of his mind kept suggesting it had something to do with the man he'd shot, but that didn't make any sense. Along with his father, he'd killed billions. Shooting one man—one that didn't even die—was nothing to him. It had to be the Coriolis.

His father had made it very clear that Filip's universe stopped at the airlock. The *Pella* and everything in it was his the same as it always was, but Ceres Station was worse than vacuum. Fair or unfair, Filip was banned from the station for life. It was the deal Marco had struck with the OPA governor, Dawes. The others would be an active part of the evacuation, but Filip could only watch. And so he walked the corridors, went up and down the lift, slept, ate, exercised, and waited while just on the other side of the airlock, all the people he knew best stripped Ceres Station to the studs. He'd have been part of the effort if he could. Maybe that was all it was. Maybe it was just the fact that he'd been left behind and relaxing while the others did the work didn't sit well with him. That seemed more likely than Coriolis. Or the man he'd shot.

The truth was, he didn't remember much of the event. He'd been out with maybe a dozen Free Navy and some local fringe and hangers-on. According to the old laws he was still too young to be in the bars and brothels, but he was Filip Inaros and no one had suggested he leave. There had been music. He'd danced with a local girl, admired her tattoos, bought her drinks. And he'd kept up with her too, drink for drink. She'd liked him, he could tell. And if the music had been too loud for them to talk, that didn't matter. He could tell.

Her interest hadn't been about him so much as about the story of who he was. The son of Marco Inaros. Karal had warned him. Marco had warned him. Some people would be attracted to what they thought he was. He had to be careful always to remember who his family was. Not let himself be baited or seduced. The Free Navy had the power now, but there were still people on Ceres who were more than half loyal to the old ways.

Our enemies, at least you know where they stand, his father had said when they arrived at Ceres. *There's nothing you can trust less than half-Belters*. Marco hadn't said it straight out, but he'd meant Filip's mother and all the people like her. Belters who'd let themselves be turned away from the Belt and the condescending Fred Johnson Earthers who pretended to care about them. *Moderate OPA* was just another way to say *traitor*. So Filip had known not to trust the girl, even while he was drinking with her. Drinking too much with her. When she'd left without telling him, he'd felt humiliated and angry. And then something had happened, he couldn't quite put together, and he'd been carted off by Ceres security and his father called. Which had been humiliating again.

They hadn't talked, not really. Marco had ordered him to stay on ship, so on ship he'd stayed. Maybe they'd never speak of it again. Maybe that conversation was still coming. Maybe not knowing which was what left him feeling wrong. He didn't know. He hated that he didn't know.

He sat in the gunner's station, the screen slaved to his terminal, and sampled the feeds. A man posting under an old-style OPA banner shouting about how the Free Navy was the last, best hope for Belter liberty. A thin-faced coyo sitting too close to his camera talking in halting Farsi about the implications of the biologicals supplied by Earth being cut off. Some high-end pornography in what looked like a water treatment plant and a hotel lobby. An old Sabbu Re movie series, pairing him against Sanjit Sangre

back when Sangre had still looked like a badass. Noise. It was all just noise and images, and Filip let them wash over him without noticing what he was taking in. An impressionistic sense of violence and victory, with him and his father at the head of it all. Arousal and anger paired with all the complexity of an old way of life passing into darkness.

When he killed the speakers, the *Pella* was quiet in the never-quite silent way a ship had. The drive was off, so there were none of the low hums or occasional harmonics that made the background of his normal life. But the decking joints still ticked and murmured as the plates warmed or cooled. The air recyclers hissed and huffed and hissed again. So maybe that was part of what felt wrong. The sounds of a ship under thrust were so unlike a ship in dock that the subtle background music of his life had changed and set him on edge. The tightness in his belly, the impatience like an itch in his soul that kept him uncomfortable no matter what position he sat in or stood. The ache in his jaw and across his shoulders. Maybe they were just the natural expression of a man used to being in motion being forced into passivity. That was all. Nothing more than that.

Before you kill yourself, his mother had said, come find me.

He stood up, shut down the feeds with a gesture, and stalked down toward the gym. The good thing about being alone was that no one was using any of the equipment. He didn't bother warming up, just brought down the resistance bands, strapped in, and pulled. He relished the way the handles bit into his palms, the sense of his muscles protesting and tearing, each little injury making them grow back again stronger. Between sets, he turned on some music—loud, aggressive dai-bhangra—only to stop in the middle of the next set and turn it off again.

Everything he wanted annoyed him as soon as he had it. He wondered if he'd have felt the same about the girl. If she'd stayed, and they'd fucked, if afterward he'd have wanted her gone. Turned off like the music. He didn't know what it would take to make him feel right. Getting the fuck off Ceres wouldn't hurt, though.

The voices came first, loud and laughing and familiar as Tía Michelle's bread soup. Karal and Sárta, Wings, and Kennet and Josie. The crew, coming back on board. He wondered if his father was there yet, and what he hoped the answer would be.

"Bist bien," Wings said. "Jeszcze seconds more."

The older man staggered a little as he stepped into the gym. His hair was swept up at the sides as it always was, but with a little less crispness than usual. His real name was Alex, but someone had started calling him Wings because of that hairstyle, and his eyes were bloodshot pink, and his gait was a little too relaxed and unsteady. He had a crumpled purple bag under his arm.

“Filipito!” he said, lumbering over. “Bila a ti, I was.”

“And now found me,” Filip said. “So geht gut, yeah?”

“Yeah yeah yeah,” Wings said, not hearing the bite in Filip’s words. The older man lowered himself to the deck, and watched blearily as Filip pulled against the bands and trembled with the effort. “Done. Alles complét. Everyone coming home to ... to roost. Or ... not roost. Fly, sa sa? We’re flying out into the big, big empty.”

“Good,” Filip said. He made the last pull of the set, holding the tension long and hard until his arms shook and burned and failed. The bands snapped back a few centimeters, then slowed and retracted. Filip squeezed his fists. Wings held out the bag.

“Yours,” he said.

Filip looked at the bag, then at Wings who shook it at him in a *take it* gesture. It looked like plastic, but it felt and folded like paper in Filip’s hands. Whatever was inside it shifted, limp and heavy as a dead animal.

“No point leaving anything for the pinché inners,” Wings said. “Confiscations all over the station. Anything they didn’t bolt down and half of what they did. Only since tu es lá, I think for you. Yeah?”

He opened the flap. Something dark and textured, regular and irregular at the same time. He pulled the bag free and unfolded the heavy material. It wasn’t like anything he’d ever seen before. He unfolded it.

“A ... vest?” Filip said.

“For you,” Wings said. “Leather, that. Alligát. Real too. From Earth. Took it from a high-end shop by the governor’s quarters. Very rich. Only the best for you, yeah?”

Filip gave into the temptation to smell the thing, putting the dead animal’s cured scales against his nose and breathing in. There was something subtle and beautiful about the leather—not sweet and not sour, but rich and low and deep. He put it on, settling the weight across his sweat-damp shoulders. Wings clapped his hands in glee.

“You know how much *esá* cost?” Wings said. “More scrip than you or me would see in five years. For that. Just that. Would be some pinché Inner strutting around the Belt wearing it just to show how he could and we couldn’t, yeah? But we’re Free Navy now. No one better than. None.”

Filip felt the smile on his lips, tentative as a breeze. He imagined himself in the bar now, wearing his leather vest like the richest of the rich from before. Wings was right. This was the kind of thing that no Belter could have had. A symbol of everything that Earth used to remind them that they were less. Small. Not worth. Only who had it now?

“Aituma,” Filip said.

“Welcome. You’re welcome,” Wings said, waving Filip’s gratitude away. “The thing for you, the pleasure for me. Good trade *à alles*.”

“How much was it a *reál*?” Filip asked, part to let Wings brag, part so he could brag himself later. Only Wings had lain back on the deck, his arm over his eyes.

The man shrugged. “Nothing. Everything. For for? Shop’s closed. Not like there’s going to be another shipment of them, yeah? *Esá* es the last leather vest out of Earth. *End point*.”

The Free Navy left Ceres Station like spores shed by a fungal body. Drive plumes lit and flared and blinked out again like images Filip had seen of fireflies on Earth. If there were still any fireflies on Earth.

And while each Free Navy ship carried a few civilians away toward safety, theirs were far from the only ships leaving. As soon as Marco had made his intentions clear, a wave of civilian refugees had made themselves ready. Rock hoppers and prospectors and shitty half-legal transport ships all filled to the bulkheads with people desperate to get out of the great city of the Belt before it fell back into the hands of Earth and Mars. And in the midst of it all, the great spinning plume of water and ice as the reservoirs vented. The water reserves spun out from the station, briefly echoing the arms of the galaxy and then stopped, thinned, and spread out into the vast darkness of the Belt. Ice lost among the steady brightness of stars.

The docks, they left in ruins. The reactors, powered down, then either

sabotaged or stripped. The power grid and tube systems dismantled. The defense grids stood quiet, their magazines open and empty. Transmitter and sensor arrays were salvaged for parts, then melted to slag. The medical centers had been raided and emptied, leaving only enough to treat the patients already in their care. Taking *those* supplies, Marco said, would have been cruel.

Of the six million people on Ceres, maybe a million and a half would escape before the enemy arrived. The ones that remained would be in a shell of stone and titanium hardly more capable of sustaining life than the original asteroid had been.

If Earth hunkered down and rebuilt, it would take them years to get back to where Ceres had been, pinning them to the station like insects against a board. If Earth chased and attacked the Free Navy, they would be firing on ships carrying refugees. If they abandoned the station, millions of Belters would die under their care and push anyone still sympathetic to the old ways toward the new. Anything they did would be a victory for the Free Navy. They couldn't win. That was Marco's genius.

On the *Pella*, things fell quickly back into their old patterns of duty, but Filip saw differences now. Ways that Ceres Station had changed them. For one thing, the liquor was better. Jamil had his whole cabin stacked with bottles in polished boxes carved from real wood. The packaging alone would have cost more than Filip would have seen in three years' work, to say nothing of the whiskey inside them. Dina came back with half a dozen hand-painted silk scarves confiscated from an Earther's mansion, and she wore them like a bird proud of its plumage.

Everyone wore trinkets of gold and diamond and peridot, but the best was the amber. All the other gems and jewelry could maybe get mined from the Belt. Amber, though, needed a tree and a few million years. It was the one stone that spoke of Earth, and wearing it showed who they'd become better than all the perfumes and spices and leather vests there would ever be. The luxuries that Earth and Mars had bled the Belt to acquire belonged to the Free Navy now. Back to the Belt, as was only just.

It would have been perfect, except for his father.

From the moment Marco had returned to the ship, Rosenfeld at his side, Filip found himself avoiding them. After the first few days spent on the burn, he realized he was waiting to be summoned. Lying in his bunk, trying

to sleep, Filip imagined himself under his father's gaze, called upon to justify all that he'd done on Ceres. Murmuring under his breath so that no one passing by could hear it, he rehearsed all the things he would say. It was the security man's fault. It was Filip's own failing, driven by humiliation at the local girl's disrespect. It had been an accident. It had been justified. The image of the girl from the club slowly shifted in Filip's mind until she became something like the devil incarnate. The security man he'd shot grew in his private retellings to become a bumbler and a fool and likely a sympathizer for the inner planets.

When the confrontation he'd dreaded finally arrived, it was nothing like he'd expected. Late at night, his cabin door had simply opened and Marco stepped in as casually as if the room had been his own. Filip sat up, blinking away sleep as his father sat at the foot of his couch. The drive pressed him down at a gentle quarter g. He gestured, and the system brought up the lights.

Marco leaned forward, fingers knotted together. His hair was pulled back in a high, tight bun that drew the skin around his temples tight. Stubble darkened his cheeks and his eyes seemed to have retreated a few millimeters. *Pensive*, Filip thought. He knew that his father would turn in on himself sometimes. This was how he looked when it happened. Filip pulled his legs up, hugging his knees to his chest, and waited.

Marco sighed. When he spoke, his accent was thicker than usual.

"Appearances," he said. "Savvy? War y politics y peace and all in between? It's about appearances."

"If you say."

"Leaving Ceres, it was right. Clever. Genius move. Everyone says it. The inners, though. The old bitch on Earth and the new one on Mars? They'll say otherwise. Call it fleeing, yeah? Retreat. A victory against the Free Navy and all it stands for."

"Won't be."

"I know. But going to have to show it. Demonstration of power. Can't ..." Marco sighed again and leaned back. His smile was weary. "Can't give them the tempo."

"Can't, so won't," Filip said.

Marco chuckled. A low, warm sound. He put his hand on Filip's knee, his palm rough and warm. "Ah, Filipito. Mijo. You're the only one I can

really talk to anymore.”

Filip’s heart swelled in his breast, but he didn’t let himself smile. Only nodded the serious nod of a grown man and military advisor. Marco closed his eyes for a moment, leaning back against the bulkhead. He looked vulnerable then. Still his father, still the leader of the Free Navy, but also a man, weary and unguarded. Filip had never loved him more.

“So,” Marco said, “we will. Show of strength. Let them take the station and then show that they’ve won nothing against us. Not so hard.”

“Not at all,” Filip said as Marco pushed himself back up to standing and stepped to the door. When his father was halfway into the corridor, Filip spoke again. “Is there anything else?”

Marco looked back, eyebrows lifted, lips pursed. For a moment, they considered each other. Filip could hear his own heartbeat. All of his practiced lines seemed to have vanished under his father’s soft brown eyes.

“No,” Marco said, and stepped out. The door closed with a click, and Filip let his head sink onto his knees. His mistake on Ceres was gone. Forgotten. A disappointment he couldn’t explain tainted the relief that flowed through him, but only a little. He’d almost killed a man, and it was okay. Nothing bad was going to come of it. It was almost as good as being forgiven.

Someone should have kept that from happening, his mother whispered in his memory.

Filip pushed the thought away, turned his lights back down, and waited for sleep.

Chapter Fifteen: Pa

The grease crayon was meant to mark decking during construction, and so in a sense Michio was still keeping to its purpose. The marks weren't inventory control or inspection chop, and what she was constructing wasn't a ship, but still. The wall of her cabin had a long rectangular mark where she usually kept a mounted lithograph. An original print by Tabitha Toeava of false coral structures. Part of her *One Hundred Aspects of Europa* series, and it rested in its frame on her crash couch like it was watching her.

Along one side of the wall, Michio had listed the major settlements of the outer planets: Ceres, Pallas, Vesta, Iapetus, Ganymede, and on and on. Some were based on moons, some in the tunnels of well-mined asteroids, and a few—Tycho Station, the Shirazi-Ma Complex, Coldwater, Kelso—were spin stations that floated free. She'd started writing what she thought they needed there: water where there wasn't local ice, complex biologicals everywhere but Ganymede, construction material, food, medical supplies. When it got too dense to read, she cleaned the wall with the side of her fist. The smears were still there.

In the middle column, the colony ships she and her fleet had taken: the *Bedyadat Jadida*, out of Luna. The *John Galt* and the *Mark Watney*, out of Mars. The *Helen R. and Jacob H. Kanter*, sponsored by the Congregation Ner Shalom. The *San Pietro*, sponsored by the DeVargas Corporation. The *Caspian* and the *Hornblower* and the *Kingfisher*, operating under independent charters. All of them stocked to make settlements on new and hostile worlds. Some hardly had enough for a small human toehold. Others, enough to carry a hundred people for three years. Enough to keep the Belt running long enough to remake itself independent of Earth and Mars. Hopefully.

And on the other edge, her own fleet. *Serrio Mal* captained by Susanna Foyle, *Panshin* by Ezio Rodriguez, *Witch of Endor* by Carl al-Dujaili, and

so on down the wall. Each of them with their own complement of boarding troops. All of them were hers to command, and would be until it came clear that she answered to herself now. Then ... Well. That would be then.

She squeezed the grease crayon and released it. The soft click as it gave up its grip on her fingertips again and again like someone tapping on the door. With every mark she made, the fear in her chest shifted. It didn't leave her—nothing as straightforward as that—but instead of feeling bright and jittery and jagged, her heart folded in on itself and let the crust of a lifetime's failures and pains fall away. At least for a little while. It felt like getting on a treadmill and finding the perfect rhythm. One that brought her breath and her body and her mind together and stilled time.

When she'd started, she'd half hoped to find a reason she couldn't go through with her mutiny. Now that she was engaged, the doubt was forgotten. Somewhere in the process, she'd gone from whether she should to how she was going to. Until Nadia spoke, Michio didn't even notice she was there.

"Bertold still not letting you on the system?"

Michio sighed and shook her head. "Until we make the break, he wants everything off the computers. He's got the local countermeasures ready to update. But you know how it is. Tipping our hand."

"Do you think Marco is monitoring the ship that closely?"

"No," Michio said. Then, "I don't know. Maybe. It's all right. Part of me likes working this way. It's more ... I don't know. Tactile?"

"Can see that," Nadia said. "We're getting close."

"I don't want more than a second of light delay," Michio said. "I can't do this trading messages. I have to be able to *talk*."

"We're getting close," Nadia said again, her voice a halftone lower. She understood.

Michio squeezed the grease crayon and relaxed. Tick. "How long?"

"By tonight," Nadia said. She stepped in close, considering the wall and all of its markings. She was half a head shorter than Michio, and the first scattering of gray hair complicated her temple. She sighed to herself and nodded.

"Checking my work?" Michio said, teasing a little.

"Yes," Nadia said seriously. "This was a complicated situation before. We're about to make it much more. Times like this, we check the seals we

just checked.”

Michio sat on her crash couch and let her wife go over all the ships and stations. Nadia put her hands to her hips in fists and made small sounds in the back of her throat. Michio thought they were approval. It would be easier when she had the ship’s system available to plot it all out, place each ship and its vector on a single interface. Even with her wall a mass of careful handwriting, there were other lists—longer lists—of critically important information. The warships under Marco’s direct control. The elite guard force that Rosenfeld held in reserve. The thousands of supply containers from Pallas and Vesta and Callisto that had already been scattered to the care of the overwhelming void. Michio stretched her back against the one-third g braking burn, feeling the ache between her ribs.

“When are we going to steal it all?” Nadia asked.

“When I talk to Carmondy,” Michio said. “Earlier than that, and Himself might notice. Later, and he might be warned.”

“Ah, Carmondy,” Nadia said with a sigh. “It bothers me.”

“Me too,” Michio said. Nadia turned from the wall to consider her. The air of checking for errors didn’t change.

“What bothers you?” Nadia asked.

Michio nodded at the wall. “All this. Doing what I’m about to do.”

“You don’t think it’s right?”

“I don’t know if that matters. I mean, Marco does what he thinks is right. And Dawes. And Earth. All of them do what they think is right, and tell themselves that they’re moral people with the strength to do the necessary things, however terrible they seem at the time. Every atrocity that has been done to us had someone behind it who thought what they did was justified. And here I am. A moral person with the strength to do this. Because it’s justified.”

“Ah,” Nadia said. “You don’t think Carmondy will join us.”

“I don’t. And then I think I’ll have to make an example of him so that the others will take me seriously.”

“It’s not much of a pirate queen who leaves survivors in peace,” Nadia said. And then, “You’re wrong about one thing, though. Not every evil thing is done by the righteous. Some people do harsh things for the pleasure. But that isn’t what bothers me.”

Michio lifted her hands, asking the question.

“Working with Carmondy,” Nadia said. “I don’t know what it is. The man annoys me.”

Both of their hand terminals chirped a connection request from Laura on a family-restricted channel. Nadia nodded to Michio to accept and then sat at her side so they could both see the screen. Laura was on the command deck, the backslash of her control screen lightening her cheeks and dancing in her eyes. Icons of all the others except Nadia appeared along the side.

“What is it?” Nadia asked.

“Newsfeeds just arrived,” Laura said. “The inners have Ceres. Making an announcement.”

They were all silent for a moment. Knowing that it was coming pulled the punch, but Michio still felt it in her gut. “Play the feed,” she said.

Laura nodded, shifted forward to her controls, and blinked out. A feed appeared in her place. Earth and Mars naval ships docked in the berths at Ceres. Seeing them there was disorienting, a juxtaposition of two things that don’t belong together. Even though she’d known it was coming, the feeling was strong.

“—estimated at four and a half million, with sufficient reserves to sustain the station for a maximum of two weeks. The combined fleet is presently developing relief strategies including emergency rationing and a call for food and water from other stations in the Belt and the Jovian system.”

The image jittered and cut away, a sloppy edit done by an amateur. And then his face filled the screen. Fred fucking Johnson. Michio felt her gut clench. So that was their play. Trot out the Earther to speak for the Belt. Again. His eyes were soft and deep and sorrowful. His hair was close cut and white. A pale stubble stood out against the darkness of his cheeks. The text along the screen’s edge said Fred Johnson—OPA Spokesman / Tycho Manufacturing.

Not Colonel Fred Johnson. Not Butcher of Anderson Station. Opportunist. Face of the Belt When Earth’s Holding the Camera.

“Michi?”

“I’m fine.”

“The culture in the outer planets,” Johnson said, “has always been one of mutual support. Conditions aboard ship and on stations have always

tested humanity's ingenuity and competence. In the many, many years I've worked with the Outer Planets Alliance, I have never seen that ethos betrayed more profoundly than this."

"You're right," Michio said. "I'm not fine. Shut it off."

Nadia gestured to the screen, and the feed vanished. Michio stood for a long moment. She didn't remember crushing the grease crayon, but it was a sticky pulp in her hand now. She took a towel from her cabinet and tried to wipe her fingers clean. The crash couch shifted behind her as Nadia sat on it. When Michio had her control back, she turned around. The intimacy of years let her read half a dozen things in Nadia's expression.

"He's not our natural ally," Michio said. "The enemy of my enemy is my friend? That's bullshit. There are always more than two sides. Pretending it's only one or else the other is what let that sonofabitch carry so much weight in the OPA for as long as he did."

"He still does," Nadia said. "Some people will listen to him. He has ships."

"I'll get us ships. We don't need his protection."

"If you say," Nadia said. And then, gently, "Maybe he needs ours."

"He's a big boy. He can take care of himself."

"Four and a half million, though. That's a lot of people."

"Earth wanted the station. They have it. Good for them," Michio said, but her voice sounded less certain in her own ears. "They can take care of it."

"They're going to need food. Water."

Michio pointed to the list she'd scrawled on her wall. Her fingers were dark from the crayon. "Every base on that list is going to need food and water too. Medical supplies. Reaction mass. Construction material. Everything. Everyone is going to need everything. I'm not going to put Ceres at the top of our list. They've got help."

"They got robbed," Nadia said. "By us."

"By Marco."

Nadia smiled and looked off to her left, the way she did when she was ready to end an argument but didn't agree that she'd lost it. Michio couldn't let it go. The words pressed up out of her like Nadia had said them. Had invited her response.

"It's not only that it's Fred Johnson," Michio said.

“If Ceres starts to starve,” Nadia said, ending the question as if it had been a statement.

“Fine,” Michio said. “If Ceres Station starts going hungry. If they’re running out of water. I’ll help the people on Ceres. Not for Johnson, not for the OPA. But I’ll help the people there.”

Nadia nodded, but still looked off to her left, staring at the empty screen like there was a picture still glowing on it. Michio even looked, but there was only black.

“And Earth?” Nadia asked.

“What about it?”

“People are starving there.”

“No,” Michio said. “I won’t send our supplies to Earth. They had centuries to help us, and they didn’t.”

Nadia’s smile widened a millimeter as she rose to her feet. She kissed Michio’s cheek and left. A moment later, her voice came from down the corridor with Evans answering. The life of the ship continued, even with everything changing around it. Michio turned back to her lists, but she wasn’t sure what she was looking at anymore. Her mind kept sliding back to Fred Johnson’s soft, tired eyes. *I have never seen that ethos betrayed more profoundly than this.* She leaned forward and used her thumbnail to scrape a clean line through the center of the word *Ceres*. The gray of the wall showed through the center of the letters. But she didn’t rub it out.

When, eight hours later, the *Connaught* finally came within a light-second of the *Hornblower*, the newsfeeds had settled on their narrative about the retaking of Ceres. The phrase *combined fleet* became a kind of catch-all for the patchwork of Earther and Martian naval ships that were clustered there beside a ragged handful of Belter vessels. It was like going back to the days before Eros, when the alliance between the inner planets had seemed unshakable. Certainly there was some nostalgia among the inner planets’ commentariat, but the reports from Earth and Mars kept the wailing for the golden age of squeezing the Belt in perspective. Riots had broken out in Londres Nova and scuttled a meeting of the Martian parliament, and the best news from Earth was that the climbing death rate was linear instead of exponential, with hopes that it would level off as the most vulnerable and compromised parts of the globe finished dying.

Marco had gone quiet, though she assumed that meant he was busy

planning his next steps with some part of his cabal that didn't include her. That suited her fine. She had enough to think about already.

She had already recorded her message to the other captains under her command. It was ready for tightbeam transmission at her word, and once they went out, there'd be no going back. Nothing else, not even talking to Carmondy, was as irrevocable as that.

So why did putting in the connection request to the *Hornblower* feel like stepping out an airlock?

Carmondy accepted the connection request, and his face appeared on her screen with an icon that showed the communication was secure. His face was broad and placid. On another man, it might have given the impression of harmlessness, but Carmondy had already killed people on her order. She wasn't fooled.

"Captain," he said. "Wondered when I'd hear from you. Alles gut, yeah?"

"Alles interesting anyway," Michio said with a smile that, to her surprise, was mostly genuine. "Looking at some changes to the plan." The message went out to the *Hornblower*, and it came back. One second each way. It made Carmondy's response seem considered and thoughtful. An illusion made from distance and light.

"I heard. Ceres. Hell of a thing."

"Yes," she said. "Ceres. More than Ceres too. Technically, I know you're in Rosenfeld's chain of command, but I'm about to issue some orders to you and your people. I'd appreciate it if you'd follow them."

One second. Two. Carmondy's eyebrows went up. Another second. "Interesting, sa sa? Tell me."

You can turn back. You haven't said it. No one knows but your family, and they'll still support you if you back away. Put your faith back in Inaros. Or find another Himself out there to fall in line behind, since that always works out so well.

"I'm rerouting the *Hornblower* to Rhea. Cutting the prisoners loose. Redistributing the cargo."

One second. Two. Or was it a little faster this time? How close were the ships now? "Rhea not one of ours."

"It's not aligned with the Free Navy, no," Michio said. "That's why I picked it."

One second. No, the messages were definitely coming faster now. Carmondy nodded and sucked his teeth. A high, hissing sound as his eyes narrowed. She watched him understand and waited to see his reaction.

“Mutiny, then?”

“Won’t be my first,” she said with a lightness that she didn’t feel. “Taking as many ships from my command as will come. Mission’s the same. Get the colony ships and support the Belt. No drift.”

The pause seemed to last forever. “No drift,” Carmondy said and shrugged. “Bien. You want us to ride it there, or are we coming back on board?”

Alarms went off in Michio’s hindbrain. This wasn’t right. She shook her head. “Ah, Carmondy. We could have been beautiful. You’re coming on board. All your people. But you’re sending your arms and armor here first, and you’re coming in pairs.”

Pause. “Oh now, Captain, I don’t see how that happens.”

“I’ve got two options,” Michio said. “Bringing you and yours, armed and armored, onto the ship because I’m just so sure you’re loyal to me and not Marco? Not one of them.”

Pause. A smile she couldn’t quite read. Carmondy leaned in toward his camera. His hands weren’t in the square of the screen, but she imagined them folded together on his table. When he spoke, his voice was just as friendly but somehow flatter. “Que then?”

“Either you and yours come to me and I send the supplies to the Belt the way we always said we would, or I kill the *Hornblower* as a warning to al-Dujaili and Foyle and the rest that I’m serious.”

It took longer than two seconds this time. Longer than three. Michio kept her expression calm even while her heart was thudding against her ribs like it wanted out.

“Here’s what I say,” Carmondy said. “I turn this pinché ship to Pallas. You go your way, I go mine. A que comes between you and Inaros comes between you and Inaros. But you and me walk away, honor on all sides.”

Yes floated in the back of her mouth, ready to be said. She wanted this over. She hated conflict. How the hell had she wound up living in the middle of it?

“No,” she said. “Your arms and armor in a pack out the airlock within the hour or we break the *Hornblower* again. And we mean it this time.” She

shrugged. She waited. About a second this time. Closer.

“Kill us to make a point?” he said.

“Kill you so I don’t have to kill as many other people later. Rather be loved than feared, but hey. Fallen world.” Pause.

“You can’t stop me getting the word out,” Carmondy said.

Michio sighed, shifted the feed, and sent out her message. The one that began, *You have put yourself under my command out of loyalty to the Belt, and out of loyalty to the Belt I expect you to remain.*

So that was it. Her time with Marco Inaros was over. Michio Pa, once OPA, once Free Navy, now just herself and her ship in a universe all too ready to see her destroyed. For all the consequences that were coming now, for all the pain and loss she’d just invited into her life, she still felt relieved. Like she was where she was supposed to be.

“They know,” she said. “Now can we get to the part where you surrender, or are you going to insist that I kill you?”

Chapter Sixteen: Alex

Seriously,” Arnold Mfume, one of Fred Johnson’s spare pilots, said. “You used a rail gun as a *drive*? To pull a ship up from a decaying orbit?”

Alex shrugged, but the little bloom of pride in his chest was warm all the same. “Naomi did all the math on it,” he said. “I was mostly babysitting the *Roci* while it followed her orders. But ... well, yeah.”

“That is fucking insane,” Arnold said through his laughter.

“Didn’t really have any other choices,” Alex said. “We wind up doin’ a certain amount of improvisation, one way and another.”

Across the table from him, Sandra Ip smiled. He didn’t know if the way her eyes were locked on his was a sign of how drunk she’d gotten, the beginning of an erotic invitation, or a little bit of both. Either way, he found himself smiling back.

“Wish I’d been there,” Mfume said.

“I kind of wish I hadn’t,” Alex said. “It’s a lot more fun now that it’s not going on anymore. At the time, it was more in the oh-shit-we’re-all-going-to-die category.”

“That’s what adventures are,” Bobbie said, and Ip’s lazy smile tracked over toward her without changing much. So more about drunk maybe. “Shitty things that make for good stories later.”

“I heard *you* went hand-to-hand with a protomolecule soldier,” Mfume said.

“That’s not even a good story,” Bobbie said. Her smile kept it from being awkward, but that path of conversation was definitely closed. Mfume shifted, and Alex could see the temptation to push. To maybe get Bobbie to elaborate, even if it was only a little bit more.

“Now, you want to talk about flying,” Alex said, “you should hear about when Bobbie and me were trying to outrun the Free Navy.”

“Pretty sure we told that story,” Bobbie said.

Alex blinked and looked into his glass. She was right. He had told that story, and since they'd all sat down, Ip might not be the only one well on her way to tipsy. "Right," he said. "In that case, you want to talk about flyin', you should get another drink."

He lifted his arm and leaned back, trying to catch the server's eye.

The Blue Frog was a port bar, and if Alex had to guess, he'd say it had seen better days. The round tables hunched together within larger, swooping, glowing structures that defined the booths that he and the others leaned against. Only the lights seemed dirty and the table was chipped. Different menus detailed the services of the bar: food, drink, pharmaceutical, sex. An empty stage promised live music or burlesque or karaoke, only later. Not right now. And more than that, there was a smell to the place. Not unpleasant, not rotten, but tired. Like spent oil or old sealant.

The expanded crew of the *Rocinante* were scattered among three tables. To Alex's right, Amos sat grinning like a vaguely ominous Buddha with Clarissa Mao, Sun-yi Steinberg, and a shirtless young man who Alex suspected had been ordered from a menu. To his left, Naomi and Chava Lombagh were locked in a vigorous conversation, while Gor Droga and Zach Kazantzakis leaned back, keeping out of it. The other tables were dominated by a mixture of Earth and Mars navy crews. The crispness of their military uniforms and haircuts seemed out of place, like they were rebuking the architecture for being only what it was. Here and there locals hunched together like they were defending a position against a siege. Covert glances of the natives of Ceres didn't carry a sense of threat as much as bewilderment. The music that leaked from hidden speakers stayed lower than the conversation, shimmering major scale notes making an ambiguous wash of sound, neither celebratory nor sad.

The manager—a dark-skinned man with cold blue eyes and a permanent near-smirk—caught Alex's glance, nodded to him, and sent a server trotting over. The smile on the woman's face seemed almost genuine. Alex ordered another round for the table, and by the time his attention came back to the conversation, the topic had moved on.

"There were rules about that in the service," Bobbie said.

"But there were ways to get around them, right?" Ip said. "I mean, you aren't telling me everyone in the Martian Navy's celibate."

Bobbie shrugged. "If you're in a relationship with someone above you

or below you in the chain of command, it's not a joke. Dishonorable discharge, loss of benefits, maybe jail time. That takes a lot of the shine off. But I wasn't Navy. I'm—I was a marine. If there was a little cross-training between services, it wasn't a problem until it started messing up operational efficiency."

"I heard they put chemicals in the food to lower people's libido," Arnold said.

Bobbie shrugged. "If they did, they didn't put in enough."

"What about on the *Rocinante*?" Ip said, turning her full attention to Alex. There was definitely more than just alcohol in the question. "Do you have rules against cheap, sleazy fraternization?"

Alex chuckled, not certain whether he was getting excited or uncomfortable. "Captain and the XO have been together damn near since we got on the ship. It'd be a difficult rule to enforce on the rest of us."

Ip's smile shifted. "You used to be a Navy boy, didn't you? You and the gunny here ever ..."

Alex regretted ordering the next round. He was going to need his wits about him pretty soon here. "Me and Bobbie? Nah. That ain't a thing that happened."

"We haven't actually shipped out together that much," Bobbie said. "And anyway ... No offense, Alex."

"None taken."

"Really?" Ip said, leaning forward. Her knee pressed against Alex's in a way that was absolutely innocent. Unless it wasn't, in which case it *absolutely* wasn't. "Never even wanted to?"

"Well," Bobbie said. "There was one night on Mars. I think we were both feeling a little lonely. I'd probably have made out with him if he'd asked."

"I can't know that," Alex said, suddenly flushed with heat and unable to look Bobbie in the eye. "You can't tell me that."

Ip kept her leg pressed to his and cocked her head at him. The question was clear. *Is this a thing you're still working out?* Alex smiled back at her. *No, it was never really a thing.*

Naomi's voice lifted, carrying over the murmur of conversation and the music both. She was leaning over her table, finger raised to make some boozy point to Chava. He couldn't make out the words, but he knew her

tones of voice well enough to know it wasn't anger. Not real anger anyway. For that, Naomi got quiet.

The server reappeared with a tray of drinks, and Ip leaned across to get hers, then didn't lean all the way back. Alex felt something in the back of his mind relax. It had been a long time since he'd made this particular kind of mistake. Figured he was about due.

"Y'all excuse me for just a minute," he said. "Need to find the head."

"Hurry back," Ip said.

"Count on it."

Walking across the floor, past the bar, and to the back hall, Alex felt like something out of a bawdy joke. Soldiers pairing off after battle was about as old and worn a scenario as there was. But it had gotten that way for a reason. The tension going into battle wasn't like any other feeling Alex had ever had, and the relief when it let up was bone-deep and intoxicating. It wasn't only him or Ip. It wasn't even only sex. He'd known sailors as locked down and shipshape as a training-manual picture who'd come through action and spent the hours afterward weeping or puking. There was one pilot—Genet, her name was—suffered chronic insomnia that even medication could only manage. Every night, she'd be up for an hour between two and three in the morning. Except after an action, when she slept like a baby the whole night through. It was what came of being a primate with a body built for the Pleistocene savanna. Fear and relief and lust and joy were all packed into the same little network of nerves somewhere deep in his amygdalae, and sometimes they touched.

The flight out from Earth had been short and hard and seemed to last forever. The long-range sensors showed no active threats between the ports on Luna and the Belt, but all the way out the thought hung in the air like smoke: Were there rocks falling undetected toward Earth? Toward Mars? Was Marco Inaros three steps ahead of them, the way he always seemed to be? Even Fred Johnson had seemed preoccupied, pacing through the halls with his hands clasped behind his back. The Battle of Ceres was coming. The first fight in the war since the first straight-up ambush. The combined fleet would find out just how badass a bunch of Belters piloting stolen Martian warships really were, and there was reason to expect that would be pretty damned badass.

When the drive plumes had lit up the scans of Ceres, Alex felt it in his

throat. Long-range battle. Torpedoes launched at extreme range in unpredictable vectors, designed to come in fast and hard, hoping to slip by the PDCs. He wondered if Mars had ever managed to build a good stealth torpedo, and if the traitors who'd supplied the Free Navy would have traded in them if they did exist. He'd spent hours in his crash couch, chasing every anomaly the *Roci*'s sensor arrays spat out, whether they were above threat threshold or not. When he did sleep, it was all he dreamed about.

When the data came back that the Free Navy ships were burning away, scattered as seeds, he—like every pilot in the combined fleet—looked for the strategy in it. The loops of gravity and thrust that showed where the battle would come together, what the enemy had in its mind. Every time he came up with nothing felt like a threat. The certainty that there was a pattern and he just wasn't smart enough to see it knotted at the base of his skull until his eyes throbbed. His only comfort was that the crews of the Earth and Mars navies, who lived and breathed battle tactics, were as frustrated as he was. When the Free Navy's trap snapped shut, they'd all die surprised together.

Only it kept not happening.

When the first ships reached the docks—two troop carriers from Earth, one from Mars—Alex had held his breath. Ceres was the port city of the Belt, and it was sitting there as unguarded and inviting as bait in a trap. Traffic control gave permission to approach. The combined fleet took berths, soldiers spilled out into the docks, the moment for resistance came and went. Reports started filtering back, many of them to Fred Johnson. The Free Navy was gone. There was no armed resistance. No soldiers, only a handful of booby traps, empty storerooms and reservoirs, and a security force stripped to its skeleton and anxious to surrender to anyone willing to take charge.

The battle for Ceres Station never came. Instead, the combined fleet and the local engineering unions put together an emergency response team that was even now jerry-rigging the environmental systems and recycling plants to keep the station from collapsing. Fred Johnson had spent all his time before the *Rocinante* docked trading tightbeam messages with Avasarala on Luna and whoever would answer back from Mars, where the no-confidence vote on Smith had ballooned to a full-scale constitutional crisis. After they'd docked, Fred, a security detail in tow, had vanished into a whirlwind

of meetings with local OPA groups, unions, and the thin, traumatized remains of the administrative staff.

The rest of the crew went to the bar.

It had been strange at first—still was strange when he thought about it—watching the people of Ceres Station react to their new invaders. Everyone Alex met seemed built out of confusion and relief and anger and a kind of formless grief that spread out through the station hallways like a vapor. Ceres was a huge port, independent of the inner planets for years, and now maybe reconquered by them. Or maybe rescued. No one seemed to know if the combined fleet was the avenging hammer of Earth or the final proof that Fred Johnson's OPA was a legitimate political force. Or if maybe something bigger and stranger had happened.

The smiles of the Ceres natives were tentative, and they carried shards of rage and loss in their eyes. Even here at the Blue Frog, where the crews were welcomed and served the best of what little remained, the fleet and the natives pulled apart, uncertain of each other. Segregated by choice and history. Alex found himself thinking of it as Belters at the bar and inners at the tables, but that wasn't true. Ip and Mfume and all of Fred's people were OPA. Even the divisions between people seemed new, and nobody was quite sure yet which unspoken rules applied.

Alex came out of the men's room to a wall of sound. In the few minutes he'd been indisposed, someone had cranked up the karaoke and was shouting out a boozy version of Noko Dada's version of "No Volveré" but without any of the harmony parts. He paused at the end of the bar and looked out over the tables, hoping to find a corner where he could have a quiet word with Sandra Ip away from the stage.

Holden was at a table by himself, hunched over a white mug with a ferocious scowl on his face. Alex felt a tug of anxiety. Back at his table, Bobbie and Ip were talking over each other while Mfume laughed. Ip looked over toward him, grinned, and patted the seat beside her. He held up a finger—one minute—and sloped over toward Holden.

"Hey there, partner," Alex said. "You holding together all right?"

Holden looked up and around like he was surprised to find himself there. Then, after a moment, "Yeah, no. I'm all right."

Alex tilted his head. "Seems like you just said three different things in a row."

“I ... ah. Yeah, I did, didn’t I? I’m fine.” He nodded at the small gold packet in Alex’s hand. “What’s that?”

Alex held it up. He’d gotten the packet from a dispenser in the men’s room. The foil had a dragon’s head embossed on it and some nonsense kanji that didn’t mean anything.

Holden’s brow furrowed. “Sobriety meds?”

Alex felt himself blushing and tried to hide it by smiling. “Well, I’m thinking I may be in a situation here pretty soon where everybody needs to be able to agree to whatever they’re agreeing to.”

“Always a gentleman,” Holden said.

“Mama raised me right. But seriously, are you doing okay? Because you’re staring at that coffee like it called you bad names.”

Holden glanced down at his cup. The song sloped down to the rough trill at the end. The applause was scattered and weak. Holden turned his coffee mug on the table, setting the black surface dancing. The porcelain scraped against the tabletop until the chords of a new tune crashed out and a woman’s voice starting on a Belter Creole cover of Cheb Khaled drowned it out. When Holden spoke, his voice barely carried over the music.

“I keep thinking about my dad calling Belters *skinnies* right in front of Naomi. And the way she took it.”

“Family can be rough,” Alex said. “Especially when emotions are kind of high.”

“True, but that’s not what’s ...” Holden opened his hands. A gesture of frustration. “I always thought that if you gave people all the information, they’d do the right thing, you know? Not always, maybe, but usually. More often than when they chose to do the wrong thing anyway.”

“Everybody’s a little naïve sometimes,” Alex said, feeling as the words passed his lips that maybe he wasn’t quite following Holden’s point. Maybe he should have taken the first of the sobriety pills before he’d left the men’s room.

“I meant fact,” Holden went on as if he hadn’t heard Alex at all. “I thought if you told people *facts*, they’d draw their conclusions, and because the facts were true, the conclusions mostly would be too. But we don’t run on facts. We run on stories about things. About people. Naomi told me that when the rocks fell, the people on Inaros’ ship cheered. They were happy about it.”

“Yeah, well.” Alex paused, rubbing a knuckle across his upper lip. “Consider they might all be a bag of assholes.”

“They weren’t killing people. In their heads? They were striking a blow for freedom or independence. Or making it right for all the Belter kids that got shitty growth hormones. All the ships that got impounded because they were behind on the registration fees. And it’s just the same back home. Father Cesar’s a good man. He’s gentle and he’s kind and he’s funny, and to him Belters are all Free Navy and radical OPA. If someone killed Pallas, he’d be worried about what the drop in refining capacity would do before he thought about how many preschools there are on the station. Or if the station manager’s son liked writing poetry. Or that blowing the station meant that Annie down in Pallas central accounting wasn’t going to get to throw her big birthday party after all.”

“Annie?” Alex asked.

“I made her up. Whoever. The thing is I wasn’t *wrong*. About telling people the truth? I was right about that. I was wrong about what they needed to know. And ... and maybe I can fix that. I mean, I feel like I should at least try.”

“Okay,” Alex said. He was pretty sure he’d lost the thread of whatever they were talking about a while back, but Holden seemed at least less brooding. “So that means you’re about to do something?”

Holden nodded slowly, then drank off all that was left of his coffee at once, put the mug on the table, and clapped Alex’s shoulder. “Yeah. I am. Thank you.”

“Glad I could help,” he said. And then, to Holden’s retreating back. “Least I think I am.”

Back at the table, Sandra Ip had switched to club soda. Bobbie and Arnold were comparing stories about free climbing at different gravities, and Naomi and Clarissa Mao were at the edge of the stage, getting ready to take a turn singing. Ip caught a glimpse of the foil package in Alex’s hand, and her smile was a promise that things were going to go very, very well for him. Still, she must have read something in his expression or the way he held himself when he sat down.

“Everything okay?” she asked.

Alex shrugged. “I’ll tell you when I find out.”

Chapter Seventeen: Holden

The girl was something like a hundred ninety-two centimeters, and she would have towered over him if she weren't sitting down. Her hair was cut close to her scalp in what Holden figured was fashionable for adolescent Belter girls these days. There were probably hundreds of microfeeds about it, which he didn't follow. Or maybe she was a rebel and the hairstyle was all her own. Either way, it made the slightly enlarged head less pronounced. She sat at the edge of the bench, looking around at the *Rocinante's* galley like she was regretting that she'd come. The older woman she called Tía stood against the wall, scowling. A chaperone who wasn't impressed with anything she saw.

"I'll just be a second here," Holden said. The software package Monica Stuart had sent him assumed a level of proficiency he didn't have, and he'd managed somehow to turn off some of its intelligence defaults. The girl nodded tightly and plucked at her sari. Holden hoped his smile was reassuring. Or failing that, amusing. "Really. I've just about ... Wait, wait, wait. Okay. There."

Her image appeared in his hand terminal with tiny overlays for color correction, sound correction, and something labeled DS/3 that he didn't know what it was. Still, she looked good.

"All right," Holden said. "So, I figure anyone who watches this is going to know who I am. Could you maybe just say your name?"

"Alis Caspár," she said, her voice flat. She could have been a political prisoner the way she spoke. So, it wasn't going too well yet.

"Great," he lied. "Okay, and where do you live?"

"Ceres Station," she said, and then an awkward pause. "Salutorg District."

"And, um, what do you do?"

She nodded, settling into herself. "Ever since Ceres broke away from

Earth control, my family has been running a financial coordination service. Converting scrip from different corporations and governments into compatible. Mi family bist peace-loving people. The pressure that the inner planets put on the Belters is not the fault of—”

“Let me break in for just a second,” Holden said. Alis went silent, looked down. Somehow Monica made doing this seem really easy. Holden was starting to see how that might actually be the product of years of experience and practice and not something he could jump into without guidance. Except he didn’t have time for that, so he forged ahead. “When we met ... we met like four hours ago ... you were with some of your friends. In the corridor?”

Alis blinked, confused, and looked at Tía. The little incredulous glance was the first time the girl had looked like herself since she’d come on board.

“It was really amazing,” Holden said. “I mean, I was walking by and I saw you all there. And I was really impressed. Could you tell me about that?”

“Shin-sin?” Alis said.

“Is that what you call it? The thing with the glass balls?”

“Not glass,” Alis said. “Resin.”

“Okay, yes,” Holden said, pouring enthusiasm out toward her like dropping water onto a sponge. It all seemed to just soak in and vanish. But then Alis chuckled. It didn’t matter that it was more *at* him than *with* him. “Could you do it again? Here?”

She laughed, covering her mouth with one hand. For a long second, he thought she might call the whole thing to a halt. But then she plucked a little bag from her hip and took out four brightly colored clear spheres a little larger and softer than the marbles Holden had played with as a boy. Carefully, she set them between her fingers, resting between the second knuckles. She started singing, a high, choppy chant, and then stopped, laughed, and shook her head.

“Can’t do this,” she said. “I can’t.”

“Please, just try. It’s really great.”

“It’s dumb,” she said. “It’s kid thing.”

“I’m ... really immature.”

When she looked at Tía again, Holden glanced too. The old woman was

glowering just as deeply as before, but there was a glimmer of amusement in her ancient eyes. Alis settled, laughed, settled again, and started chanting. When the rhythm was established, she started clapping her hands together gently, and passing the spheres from hand to hand, making them seem to dance independently of her. Every now and then the chant would hit a syncopated passage so that one of the balls could drop into her palm and get tossed across to be captured between her opposite fingers. When she reached the end, she stopped, looked shyly toward Holden, and shook her head.

“Better with two people,” she said.

“Like partners?” he said.

“Dui.” Her glance behind him was no more than a flutter, but Holden knew what it meant, and a touch of glee leapt into his heart. He turned to the stone-faced chaperone, who hoisted an eyebrow at him.

“Do you ... Tía?” he said. “Do you know how to do shin-sin?”

She snorted in military-grade derision. When she came forward, Alis made room for her and handed over two of the spheres. They seemed smaller between Tía’s thick fingers. The old woman lifted her chin, and for a moment, Holden knew exactly what she’d looked like at Alis’ age.

The chant was more complex this time, sung as a round with the rhythms of one part informing and supporting whatever was happening in the other woman’s voice. The clear, colored spheres danced between their hands as they clapped palms together, crossing and recrossing, adding their claps to the song. At the moments of syncopation, they tossed the spheres across the space between them and caught them in their knuckles. By the end, both women were grinning. At the end, Tía tossed all the spheres up one after another so quickly they were all in the air at the same moment and then caught them in one hand. It wasn’t a trick that could have worked at a full g.

Holden clapped and the older woman nodded, accepting his applause like a queen.

“That is amazing. It’s wonderful,” Holden said. “How do you learn how to do that?”

Alis shook her head in disbelief at the strange Earther and his childish delights. “Is just *shin-sin*,” she said. And then her eyes went wide, and the blood drained from her face.

“Mr. Holden,” Fred Johnson said. “When you have a moment?”

“Yes, sure,” Holden said. “We were just ... Yeah. Give me a second.”

“I’ll be in Ops.” Fred smiled and nodded to the two Belter women. “Ladies.”

Holden closed down the software, thanked Alis and Tía, and walked them to the airlock, out and into the docks. After they’d gone, he watched the captured video—girl and woman with their voices and hands playing against each other, the not quite marbles weaving between them like a third player in the game. It was exactly the kind of thing he’d hoped for. He ran the compression and sent it to Tycho Station and Monica Stuart, just the same way he had the others.

He’d hoped to get a lot more done. He’d interviewed a researcher who worked on Ceres Station, self-educated through networked tutorials, plying him with yeasty beer until the older man was loose and comfortable enough to wax passionate about the beauty of tardigrades. He’d talked to a nutritionist from the hydroponic fields who’d only agreed if she could explain the water shortage situation on Ceres, and wound up being the clearest voice of grief and fear that he’d heard. He’d talked to a man who was alleged to be the oldest Belter on the station, who told a long and probably apocryphal story about the first licensed brothel to open there.

And that was all. So far. Four interviews, none of them terribly long. Hopefully it was enough for Monica to work with. She’d promised him that a lot could be saved in editing.

The docks weren’t as busy as he was used to seeing them. Especially after the press and barely controlled chaos of Luna, Ceres seemed wounded. Still reeling from the blows it had suffered. The carts and loading mechs stood idle, waiting for a ship to arrive with supplies or some warehouse on the station that still had something worth sending away.

He’d heard once about reperfusion injuries. When a limb had been pressed until all the blood was gone, the flood when it came back could break vessels, bleed into the cellular matrix. He remembered thinking at the time how strange it was for something normal, necessary, and life-giving to cause damage just by showing back up. Ceres was like that now, but he couldn’t tell if the combined fleet was the blood returning or if some other flood would have to come before Ceres could take stock of how badly it had been wounded.

On his way back in, he passed Gor Droga and Amos in the locker room running down a short that was making one of the ventilation fans run slow. Clarissa Mao was talking to them both from down in engineering. It was the sort of problem that a ship with a full crew had the spare cycles to address. At the lift, he had to wait for Chava Lombaugh to squeeze past him before he got on.

The truth was that with all of Fred's people and Holden's, the *Rocinante* still had a little less than the full crew she'd been meant to carry. That it felt crowded to him wasn't the ship design, but his own habits and expectations. A full crew would be tighter, more compressed, more like a normal Navy ship. Holden knew that. He even knew that in some ways having the extra people would keep them all safer. The *Rocinante* was built with a lot of redundant backups. The crew was supposed to be the same way. It hadn't worked out that way, though. Another mechanic wouldn't be Amos. Another pilot wouldn't be Alex. People were more than the roles they played in the function of the ship, and they weren't replaceable. And what was true of the *Rocinante* held for the larger field of humanity as well.

The lift stopped. Fred Johnson looked up from the ship controls, nodding to Holden. The lights were at the same dim settings that Alex preferred, and the backslash from the screens left Fred's skin looking darker than it was. Maura Patel sat across the deck, diagnostics spooling across the communications controls on her screen and headphones over her ears. Holden dropped into a couch beside Fred's and swiveled to face him.

"You wanted me?"

"Couple things. I'm setting up shop on Ceres for now. Avasarala's going to recognize me as acting governor," Fred said. "I'm pulling in all my favors. Everyone I know with any influence from the OPA. I'll bring them here."

"That sounds like an invitation to assassinate you."

"The risk is necessary. I don't know if my crew will be staying here or going to Tycho without me. I'm waiting on word from Drummer about that. One way or the other, I'll get them out of your hair."

"That's ... I mean, okay. But they're sort of growing on me. So what did you really want to talk about?"

Fred nodded once, a short, hard motion. "Do you think Draper will be able to speak for Mars?"

Holden laughed. “Like *speaking for* ambassador speaking for? Negotiate with the OPA? Because I was pretty sure that was up to Mars.”

“We may not be in a position to wait for them to get their ducks in a row. Smith’s out, and Richards is in, but an opposition coalition’s formed that want to put investigating the remaining military ahead of anything else.”

“You mean like ahead of fighting the war?”

“For example. Richards and Avasarala are working on it, but I need a Martian face with me if I’m going to make this combined navy hold together. With my background, I can represent the best of Earth to the Belt. I’ve been doing that for years, and I’ve built up a lot of trust. But unless I have a representative of Mars, I won’t be bringing anything new to the table. Especially with the Free Navy flying Martian ships. Inaros’ stock is very high right now.”

“Seriously? Because it looks a lot like he just walked away from the biggest port in the Belt.”

Fred shrugged eloquently. “His apologists are good at their jobs. And everything is in the shadow of what he did to Earth. Sorrento-Gillis, Gao, all of them. They underestimated the anger in the Belt. And the desperation. People want Inaros to be a hero, and so what he does, they interpret as heroism.”

“Even running away?”

“He won’t only run away. Don’t know what he’s got in mind, but he isn’t about to retire. And Ceres Station ... it’s a white elephant now. Just keeping the environmental systems running isn’t going to be trivial. We may have to consolidate. Concentrate people physically and abandon parts of the station. Which will be interpreted as Earth and Mars kicking Belters out of their homes by Inaros and his cabal.”

Holden ran a hand through his hair. “Yeah, that’s messed up.”

“It’s politics. And it’s why we need the OPA. There is support for us in the Belt, but it needs cultivation. And we have a few things going for us. They can call themselves a navy, but they’re amateurs. The kind of roughshod that thinks discipline is the same as punishment. Rumor is there’s already some dissent in Marco’s leadership. Probably, it’s over his tactics with Ceres. I still don’t understand why Dawes would let him walk away from the station, but ... well, clearly he did. And Avasarala’s keeping a lid on Earth. If the UN had crumbled the way Mars has, I don’t know

what we'd do."

"This," Holden said. "Try to gather some allies. Pretty much the same thing you're going to do anyway. Only with less hope that it would work."

Fred stretched, his joints popping, then sighed back down into the gel of the couch. The diagnostics on the comm panel flickered, and Patel tapped the run results. As far as she was concerned, the two of them might as well not have been there.

"You're probably right," Fred said. "Still, I'm glad it's not worse. Not yet, anyway."

"Maybe we'll get lucky and Inaros will get himself killed without us."

"It wouldn't be enough," Fred said. "Earth's broken. It will be for generations. Mars may or may not collapse, but there's still the gates. Still the colony worlds. Still all the pressures that keep the Belt on the edge of starvation and even less of what makes it valuable. There's no getting back to status quo ante. We've got to move forward. Which brings us back to Draper. You've worked with her. Can she do the job?"

"Honestly, I think the best person to ask is her. We all know her. We all like her. I'd trust her with my ship, and I wouldn't trust you with that. If she thinks she can, then I think she can."

"And if she thinks she can't?"

"Then ask Avasarala," Holden said.

"I already know her opinion. All right, thank you. And ... I'm going to regret asking. Do I want to know what you were doing with those two women in the galley?"

Maura Patel shifted in her chair. The first sign that she was listening to them at all.

"Filming them. That thing with clapping and marbles? It was really visually interesting, and Monica said that was something to be looking for. I'm doing these interviews, and she's helping me edit and distribute them."

"And why are you doing that?"

"It's what's missing in all of this," Holden said. "It's what let things get this bad. We don't see each other as people. Even the feeds are always about weird things. Aberrations. All the times that a Belt station doesn't have a riot? Those days aren't news. It has to be an uprising or a protest or a system failure. Just being here, living a normal life? That's not part of what the people on Earth or Mars hear about."

“So you—” Fred closed his eyes and pinched the bridge of his nose. “You’re reaching for more unapproved press releases? You remember starting a war that way once?”

“Exactly. That was talking about an aberration, because I thought that was what people needed to know. But they need all the context too. What it’s like to be a teenager with his first crush on Ceres. Or to worry about your dad getting old on Pallas Station. The things that make people here the same as people everywhere.”

“Belters rain hell down on Earth,” Fred said slowly, “and you respond by trying to humanize Belters? You know there’s going to be a raft of people who call you a traitor for that.”

“I’d be doing the same thing on Earth, but I’m not there right now. If people call me names, they do. I’m just trying to make it a little harder for people to feel comfortable killing each other.”

Fred’s screen put up an alert. He glanced at it, dismissed it. “You know if anyone else came up with the idea that they ought to put themselves in the middle of a war so they could sing songs and hold hands and sow peace for all mankind, I’d call it narcissistic opportunism. Maybe megalomania.”

“But it’s not anyone else, so we’re good?”

Fred lifted his hands. A gesture made of equal weights amusement and despair. “I’ll want a private word with Draper.”

“I’ll let her know,” Holden said, standing up.

“I can reach her myself. And Holden ...”

He turned back. In the dimness, Fred’s eyes were so dark the iris and the pupil were the same shade of black. He looked old. Weary. Focused. “Yes?” Holden said.

“The song those two were singing? Get the lyrics translated before you broadcast it. Just in case.”

Chapter Eighteen: Filip

The *Pella* coasted through the black, one node in a network of dark ships that traded tightbeams and compared strategies and planned. Stealth wasn't possible in the strict sense. The enemy would be scanning the vault of the heavens for the Free Navy's ships just as much as they were tracking the drive plumes of Earth and Mars and everyone else in the system. The universe was billions of points of unwavering light—stars and galaxies stretching out through time and space, their photon streams bent by gravity lensing and shifted by the speed of the universe's expansion. The flicker of a drive might be overlooked or confused with another light source or hidden by one of the widely scattered asteroids that inhabited the system like dust motes in a cathedral.

There was no way to know how many of their ships the inners had managed to identify and track. There was no certainty that their own sensor arrays had targeted all of the so-called combined navy's vessels. The scale of the vacuum alone built uncertainty.

The inners were easier, since so many of theirs had burned for Ceres. But who was to say there weren't a few scattered hunters, dark and ballistic in the void? Marco had a handful of Free Navy like that, or at least that was what Karal said. Ships that hadn't even been used in the first attacks, cruising in their own orbits like warm asteroids. Sleepers waiting for their moment. And maybe that was even true, though Filip hadn't heard it directly from his father yet. And he liked to think his father would tell him anything.

The days were long and empty, wound tightly around a single, overwhelming question. The counterstrike would come. The attack that would prove that stepping back from Ceres was a tactical choice and not a show of weakness. More than anything that had come before, it would be the event—Marco said this, and Filip believed it—that made clear what

made the Free Navy unbeatable. In the gym and the galley, the crew speculated. Tycho Station was the heart of the collaborationist wing of the OPA. Mars had suffered least in the initial attack, and deserved the same punishment as Earth. Luna had become the new center of UN power. Kelso Station and Rhea had rejected the Free Navy and shown their true colors.

Or there were the mining operations scattered throughout the Belt that answered to Earth-based corporations. They were easy pickings and couldn't be defended. Or taking a solid hold on Ganymede, claiming and protecting the food supply of the Belt. There was even some talk of sending recovery forces out through the ring. Take back from the colonies what should never have been there in the first place. Or install platforms above the new planets and extract tribute from them. Reverse the political order and put all the bastards at the bottom of all the wells in chains.

Filip only smiled and shrugged, letting it look like he knew more than he did. Marco hadn't told even him what the plan was. Not yet.

And then the message came.

I always respected you. That was how she began. Michio Pa, the head of the conscription effort. Filip remembered her, but he hadn't had an opinion about her before now. She was a competent leader, a little famous for stepping in when the *Behemoth's* captain had lost his mind in the slow zone. His father liked her because she hated Fred Johnson, had defected from him, and because she was a Belter and pretty to look at and the face that the Belt would see when the colony ships cracked their guts open and spilled out their treasures. Only now she stared into a camera on her ship, her hair pulled back, her dark eyes serious. She didn't look pretty.

"I have always respected you, sir. The work you have done for the independence of the Belt has been critical, and I'm proud to be part of it. I want to make it very clear before we go forward that my loyalty to our cause is unwavering and complete. On sober reflection and after a great deal of consideration, I find I have to disagree with the change in the plan for the conscription. While I understand the strategic importance of denying materiel to the enemy, I can't in good conscience withhold it from the citizens of the Belt who are in immediate need. Because of this, I have chosen to proceed with the conscription efforts as originally outlined.

"Technically, this is disobeying an order, but I have great faith that when you reflect on how the needs of our people brought us to form the Free

Navy, you'll agree it is the best way forward."

She signed off with a Free Navy salute. The one his father had created when he made everything else. Filip queued it up again, watching from the start to the end again, aware of Marco's gaze on him as much as the woman on the screen. The galley around them was empty. No, not just empty. *Emptied*. Whether they'd been ordered to or not, the crew of the *Pella* had evacuated the space and left it for Marco and Filip. If it hadn't been for a smell of curry lingering in the air, the stains of coffee on the table, it might have been their first time on the ship.

He didn't know how many times his father had viewed the message, how he had taken it the first time he'd seen it, or what the mild expression he wore now meant. Filip's uncertainty knotted at the bottom of his abdomen. Being shown the message was a test, and he didn't know quite what he was meant to do with it.

After the second time Michio Pa saluted, Marco stretched his shoulders back, a physical symbol that they were switching to the next part of whatever their conversation was.

"It's mutiny," Filip said.

"It is," Marco said, his voice and expression reasonable and calm. "Do you think she's right?"

No leapt to Filip's throat, but he stopped it there. It was too obvious an answer. He tried *Yes* in his mind, feeling the pressure of his father's attention like it was heat radiating from him. He discarded it too.

"It doesn't matter," he said slowly. "Whether she's right or wrong is beside the point. She broke with your authority."

Marco reached out and tapped the tip of Filip's nose the way he'd done when they were only father and son, not war leader and lieutenant. Marco's eyes softened, his focus shifting elsewhere. Filip felt a momentary and irrational stab of loneliness.

"She did," Marco said. "Even if she were right—she isn't, but if—how could I let this go? It would be an invitation to chaos. Chaos." He chuckled, shaking his head. Anger would have been less frightening.

Filip's uncertainty shifted in his gut. Were they destroyed, then? Was it all falling apart? The vision of the system his father had dreamed—void cities, the Belt blooming into a new kind of humanity free from the oppression of Earth and Mars, the Free Navy as the order of the worlds—

stuttered. He caught a glimpse of what the other future could look like. The death and the struggle and the war. The corpse Earth and the ghost town Mars and the shards of the Free Navy picking at each other until nothing was left. It was what Marco meant when he said *chaos*, Filip was sure of that. Nausea welled up in him. *Someone should have kept that from happening.* He shook his head.

“Some day,” Marco said, and then again, still without finishing the thought, “some day.”

“Do we do?” Filip asked.

Marco shrugged with his hands. “Stop trusting women,” he said, then flicked a foot against the wall, launching himself to the doorway. Filip watched as Marco grabbed a handhold and pulled himself away down the hall toward his cabin. All the questions he hadn’t answered floated invisibly behind him.

Left alone, Filip killed the sound to the screen and replayed her message again. He’d met this woman. He’d been in a room with her, and heard her voice, and he hadn’t seen her for the traitor she was. For the agent of chaos. She saluted, and he tried to see fear in her. Or malice. Anything more than a professional delivering a message she expected to be badly received. He played the message again. Her eyes were black and hate-filled, or steeled against dread. Her gestures were soaked in contempt, or controlled like a fighter preparing to lose a match.

With a little practice and will, he found he could see anything he chose in her.

A soft sound came from behind him. Sárta sloped into the room feetfirst, and caught herself in a foothold on the wall, locking her ankle in place and absorbing the inertia with her knees. Her smile had the same bleakness that Filip felt, and he suffered a moment’s anger that she should feel what he did. Karal’s voice came from the lift, talking in low, careful tones. Rosenfeld answered, too low to make out the words. They knew Marco was gone, then. The private audience concluded.

Sárta pointed to the screen with her chin. “Esá es some shit, que?” Fishing for information, looking to know what Marco hadn’t seen fit to tell her. Or anyone else.

“He saw it coming,” Filip said. He wasn’t even lying. Marco might not have said as much, but it was still true. Filip tapped his temple. “Knew to

expect it. Everything going to be just fine.”

Three more days on the float, and Filip knew it wasn't only the crew of the *Pella* who were feeling anxious. Every hour, it seemed, brought another round of contact requests. Encrypted tightbeam messages flooded into the *Pella*'s queue and waited there for Marco's response. Rosenfeld, as part of the inner circle, stepped in where he could. He went so far as to appropriate the command deck as a kind of private office. The war center in absentia until Marco "came back out of his tent"—whatever that meant.

For Filip, it was all an exercise in projecting confidence. His father had a plan. He'd gotten them all this far, and there was no reason to doubt he would get them the rest of the way. The others agreed with him, or at least seemed to when he was in the room. He wondered what they said when he was elsewhere. They'd all been through battle together. They'd shared their victories and the long, patient hours waiting for their traps to spring. This was different. The waiting was the same, but not being sure what they were waiting for made it feel like maybe they were waiting for nothing. Even for him.

Near the end of the third day, Rosenfeld asked Filip to join him in the command center. The older man looked tired, but his cyst-ridden skin made reading his expressions difficult. Rosenfeld had turned all the screens off. The command center felt smaller without their displays to give the illusion of depth and light. Rosenfeld floated beside one of the crash couches, his body canted a few degrees from the ship in a way that made him seem both taller and subtly threatening.

"So, young Master Inaros," Rosenfeld said, "it seems we have a problem."

"Don't see it," Filip said, but the amusement in the older man's eyes was enough to show how weak his words sounded. Rosenfeld pretended Filip hadn't spoken.

"The longer we go without responding to ... call them 'changes in the situation'? The longer we go, the more doubt starts to grow, yeah? Father Inaros is the face and voice of the Free Navy. Has been since the beginning.

His skill, yeah? His peculiar gift. But—” Rosenfeld spread his hands. *But he isn't here.*

“He has a plan,” Filip said.

“We have a problem. We can't wait for him much longer. Haven't told anyone. Hasn't found its way to the grapevine. But the problem's now, not tomorrow. Even the light lag may make us too late now.”

“What is it?” Filip asked.

“*Witch of Endor*. It's at Pallas. All the cache-safes we threw out into the void? Captain al-Dujaili has started gathering them back up. Says it's under orders from his commander, and he doesn't mean us. That's the fifth ship broken for Pa. Meantime, the Butcher's on Ceres, his ass keeping Dawes' chair warm. Calling for a meeting of the OPA clans, yeah? Black Sky. Carlos Walker. Administration on Rhea is looking to send a delegation. Free Navy made a statement when we broke Earth's chains. Statement was, *The revolution is already over*. That we'd won. Inevitable. Already happened, us. Only now, maybe not.”

Filip's gut was tight. Anger warmed his throat and shoved his jaw forward like a tumor at the base of his jaw. He didn't know who he was angry with, but the rage was deep and powerful. Maybe Rosenfeld saw it, because his voice changed, became softer.

“Your father, he's a great man. Great men, they're not like you or me. They have other needs. Other rhythms. It's what sets them apart. But sometimes they go so far into the void we lose sight of them. They lose sight of us. That's where little people like me come through, yeah? Keep the engines running. Keep the filters clean. Do the needful things until the great man comes back to us.”

“Yeah,” Filip said. The rage still shoving its way up his neck, filling his head.

“Worst thing we can do is wait,” Rosenfeld said. “Better that we point all our ships the wrong direction than that we leave them too long floating. Change it later, bring them back, they think the situation shifted. Put them on the burn, they know they're going somewhere.”

“Yeah,” Filip said. “See that.”

“Time comes to say it, if it's not him, it's going to be me. *For* him, yeah, but me. Not a bad thing if you stood with. Make everyone know it's me for him, not another Pa.”

“You want to give orders to the Navy?”

“I want orders given,” Rosenfeld said. “Don’t care who does it. Barely care what the orders are. Just there are some.”

“No one but him,” Filip said. There was a buzz in his voice. His hands ached, and he didn’t know why until he looked and saw them in fists. “My father made the Free Navy. He makes the calls.”

“Then he has to make them now. And he won’t listen to me.”

“I’ll talk to him,” Filip said. Rosenfeld lifted a hand in thanks and blinked his thick, pebbled eyes.

“He’s lucky to have you,” Rosenfeld said. Filip didn’t answer, just took one of the handholds, turned himself, and launched down the throat of the ship where the lift would have risen and fallen if there were any up and down to guide it. His mind was a clutter of different emotions. Anger at Michio Pa. Distrust of Rosenfeld. Guilt for something he couldn’t put a name to. Fear. Even a kind of desperate elation, like pleasure without being pleasure. The walls of the lift tube skinned past him as he drifted almost imperceptibly to the port. *If I reach the crew deck without touching the wall, everything will be all right.* An irrational thought.

And still, when he grabbed a handhold and swung into the corridor that led to Marco’s quarters without having to correct his path, he felt a little relief. And when he reached his father’s door, it was even justified. The fear he’d carried with him of his father wrecked by betrayal—glass-eyed, unshaven, maybe even weeping—were nothing like the man who opened the cabin door. Yes, the sockets of his eyes were a little darker than usual. Yes, there was a scent in his room of sweat and metal. But his smile was bright and his focus clear.

Filip found himself wondering what had kept him locked up so long. If he felt a twinge of annoyance, it was overwhelmed by the warmth of seeing his father back again. Behind Marco, tucked in at the edge of one of the cabinets, a strip of fabric spoke of something light and feminine. Filip wondered which of the crew had been here to comfort his father and for how long.

Marco listened to Filip’s report with a gentle attention, nodding with his hands at each point of importance, letting Filip cover everything—Fred Johnson, the *Witch of Endor*, Rosenfeld’s half-spoken threat to take the reins—without interrupting him. Filip felt the anger slip away as he spoke,

his gut relaxing as the anxiety faded, until by the end he wiped away a tear that had nothing to do with sorrow and everything to do with relief. Marco put a hand on Filip's shoulder, a soft grip that held the two of them together.

"We pause when it's time to pause, and we strike when it's time to strike," Marco said.

"I know," Filip said. "It's only ..." He didn't know how to end the thought, but his father smiled anyway, as if he understood.

Marco gestured at the cabin's system, opening a connection request for Rosenfeld. The pebble-skinned man appeared on the screen almost at once. "Marco," he said. "Good to have you back among the living."

"To the underworld and returned with wisdom," Marco said, a sharpness in his voice. "Didn't frighten you with my absence, did I?"

"Not as long as you came back," Rosenfeld said through a rough laugh. "We have a full plate, old friend. Too much needs doing." Filip had the sense that a second conversation was happening between the men he couldn't quite parse, but he kept quiet and watched.

"Less soon," Marco said. "Send me the tracking data for all of the ships still answering to Pa's commands. You tell your guard ships at Pallas *Witch of Endor's* gone rogue. Jam it, kill it, and send the battle data to us. No mercy for traitors."

Rosenfeld nodded. "And Fred Johnson?"

"Butcher will bleed in his turn," Marco said. "Never fear. This war's just beginning."

Chapter Nineteen: Pa

Iapetus Station wasn't on the moon itself, but in locked orbit around it. The station's design was old: two long counter-rotating arms supporting habitation rings, a central docking station on the axis. Lights glittered on the surface of the moon, marking automated stations where the ice was quarried and split. On their approach, there was a point where the station and moon and the ringed bulk of Saturn behind it were all the same size on the screen. An illusion of perspective.

The docks were almost filled with ancient water haulers that the tariffs had kept from harvesting the moon. No one was enforcing the fees anymore, and all the ships that could were taking advantage of the opportunity. Tugs flying teakettle rose up from the surface or dropped down toward it. Shipping containers filled with ice studded the hulls of the haulers like a crust of salt. The administration of Iapetus hadn't sided with Marco and the Free Navy or against them, but they weren't losing the chance to shrug off the strictures of Earth and Mars either. Michio watched the traffic control data and tried to see it more as liberty and freedom, less as grabbing what there was to take and getting away while the getting was good.

The comm channel opened. A request from Iapetus control. She could have let Oksana answer it, but impatience won out. "This is the *Connaught*," she said.

"Bien, *Connaught*. Iapetus bei hier. We're slotting the *Hornblower* into berth sixteen. Good to go in half an hour, yeah?"

"That'll do."

"Hear tú's have prisoners, yeah?"

"Do. Refugees too. *Hornblower*'s original crew."

"Pissed off, them?"

"Not happy," Michio said. "Think they'll be grateful to be in rooms that

aren't welded shut, though. Your supply officer said you'd be able to take them."

"Can take contract here, can book passage to Earth or Mars. Or refugees, can etwas. Prisoners are their own thing."

"Won't have them hurt," Michio said. "Don't want them let free either."

"Guests of the station," Iapetus control said. "All marked. Good and good. And ... not official, yeah? 'Gato for the load. Hydroponics were getting mighty strained with the shipments from Earth dead."

"Glad we could help," Michio said before she dropped the connection.

It was true too. There was something in her chest—a soft, golden feeling—that came from knowing that the people who would have suffered without her would at least suffer less. She'd spent more time on Rhea than on Iapetus, but she'd had enough experience to know what shortages of hydroponic equipment meant to a station like this. At the least, her shipments would mean the difference between uncertainty and stability. At most, between death and life.

It wouldn't have been this way if the Belt had been allowed to grow and become independent. But Earth and Mars had kept the labor here on a leash made of soil analogues and complex organics. Now, thanks to Marco, the Belt would have a chance to bootstrap itself up into a sustainable future. Unless, thanks to Marco, it starved and collapsed in the attempt.

She hadn't heard back from him one way or the other since she'd called her ships to refuse his orders. Statements of allegiance had come from eight of her sixteen ships. Acknowledgment from four more. Only the *Ando* and the *Dagny Taggart* had rejected her outright, and even they hadn't taken action yet. Everyone was waiting for Marco to make an announcement. Even her. And every hour he didn't made it seem more possible that he wouldn't.

Other voices, though. Oh, there were others. A collective of independent prospecting vessels out of Titania needed replacement parts for their drives. A cargo ship that was also home to a family crew of twenty people suffered a catastrophic failure of their Epstein drive's power systems and were on the drift. Vesta was putting its population on protein rationing until the food relief Michio had promised them actually arrived. Kelso Station, in an irrational fit of altruism, had sent relief supplies to Earth and was now facing shortages of water and helium-3 for the reactors.

Centuries of technology and progress had allowed humanity to create a place for itself in the vacuum and radiation of space, but nothing had overcome entropy or ideology or bad judgment. The millions of skin-bound complications of salt water and minerals that were human bodies scattered throughout the Belt still needed food and air and clean water, energy and shelter. Ways to keep from drowning in their own shit or cooking in their waste heat. And through accidents of Marco's charisma and her own idealism, she'd become responsible for it all.

But here was her start. The supplies of the *Hornblower*, instead of flying through gates and away forever, would feed Iapetus and give the station there the reserves to help others. The *Connaught* and her sister ships didn't need to solve every distribution issue. Only get the supplies, make them available, and let market forces and the communal nature of the Belt take over from there.

She hoped it was enough.

Oksana, at her station, laughed. It wasn't mirth, so much as a kind of amazed disbelief.

"Que?" Evans asked.

Oksana shook her head. Michio had known her long enough to read the gesture and the ghost of shame that came with it. *Not while I'm on duty*. Keeping that division between being family during family time and crew during crew time had always been important to Oksana. Usually, it was important to Michio too, but between waiting for a berth and dreading news of Marco, any distraction was a gift.

"What is it, Oksana?" Michio said.

"Just something odd on the newsfeeds out of Ceres, sir," she said.

"Well, I don't think it's going to disrupt us. Put it on screen."

"Sir," Oksana said, and Michio's controls vanished, replaced by a professional-looking news video, crawl at the bottom and filtering options along the side. And looking out of her screen, the earnest, open face of James Holden. For a moment, Michio was on the *Behemoth* again, and then she was back. Like a long-forgotten smell or the taste of a food eaten only in childhood, James Holden carried an echo of the guilt and fear, a reminder of violence.

Images flickered as Holden spoke: a terribly old Belter man with merry eyes, two women—one young and one older—clapping hands together in

some game like batbat or pattycake or shin-sin, a professionally dressed woman with dark skin and a sober expression standing at a hydroponics tank so long it curved up in the distance with the body of the station. *My name is James Holden, and I want to introduce you to some of the people I've met here on Ceres. I want you to hear their stories. Come to know them the way you do your shipmates and neighbors. I hope you'll carry a little bit of these people with you the way I do now.*

"Fuck is *this*?" Evans asked, laughter in his voice. "Watch the trained Belter dancing for your fun?"

"No, it's Holden," Oksana said. "He's OPA."

"En serio?"

"Johnson's OPA," Michio said. "He works for Earth too. And Mars."

On the screen, Holden was handing a bulb of beer to the ancient-looking man. The Belter's cheeks were already a little flushed, but his voice wasn't slurred at all. *Were five men for every woman on the station, back then. Five to one.*

"You shipped with him, sí?" Oksana asked. "Back in the slow zone?"

"Little bit," Michio said. "He's also waking up next to Filip Inaros' mother. The one Marco didn't manage to kill? That's him."

"And he's announcing to Big Himself y alles where he's bunking?" Oksana said. "So. Brave o crazy, him?"

"Not sure I get to criticize," Michio said, just before the fear hit her system. For a fraction of a second, she didn't know why, and then she realized what she was seeing. In the text crawl at the bottom of the screen, and just marching off the side. *Witch of Endor*. She grabbed the crawl, pulled it back. *Ship destroyed by Free Navy identified as Witch of Endor*.

She selected the feed. Her screen flickered. Holden and the old Belter laughed about Ceres Station before it had been spun up, but she didn't hear them. On her screen, the hyperreal image of an intelligence telescope showed a ship under high burn, streams of PDC fire seeming to bend as the ship accelerated away from the rounds. From the shape of the curve, she guessed it had been pulling almost ten gs. The picture didn't show what she was fleeing from, and the torpedo that managed to penetrate the defenses was moving too fast to see. The ship shifted, spinning for a tenth of a second, and then blossomed into light. *It is unclear*, the announcer said, *why the Free Navy forces appear to have attacked one of their own ships*,

but reports confirm drive plumes from several other known enemy locations on vectors inconsistent with an attack of consolidated fleet positions—

“Sir?” Oksana said, and Michio realized she must have said something aloud.

She considered Oksana’s eyes, respectful and hard. Evans’ soft and alarmed. Her crew and her family.

“We have Marco’s answer,” she said.

“Shift in language is shift in consciousness, yeah,” Josep said. He was dressed in his jumpsuit, as was she. But he was strapped into the crash couch. A complex schematic showed the state of the system as best she knew it. The ships loyal to the inners clustered around Earth and Mars and Ceres in red. The Free Navy loyal to Marco in blue. Her own handful of pirates and idealists in green. The independent stations and ships—Ganymede, Iapetus—were white. And a dusting of gold over it all showing where Marco had buried his treasure chests in the void.

“Mind is made from analogies,” Josep said, not needing her to contribute to the conversation. “Change in ages, change in the frame. Was *in* against *out* before. Turning into *connected* against *unconnected* now. *Free* Navy. *Consolidated* fleet. The ones who shrug off the chains against the ones who tie themselves together.”

A direct one-to-one battle against Marco wasn’t plausible. He had too many ships, and Michio’s appeals to Rosenfeld and Dawes and Sanjrani hadn’t won her any replies. Though they also hadn’t been rejected. Marco was the only one calling her traitor to the cause thus far. The others, she assumed, were only following his lead.

Didn’t help her in the short term.

She traced routes and burns for her green ships, arcs that would keep them out of range of the Free Navy’s wrath and still allow them to send supplies where the need was worst. It was like solving a complex math puzzle without any promise that an optimal solution existed. The search for the least-bad answer.

“Us, freest of the free. Disconnected from the disconnected,” Josep went

on. “And because of that, coming into connection. Alienated because of our commitment to community, yeah? The yang inside the yin, the growing light from inside the dark. Had to be this way. Rule of the universe. Thermodynamics of meaning, us. Shikata ga nai. So free we have only one option. Because that’s how the mind of God is shaped. Minimums and maximums sheeting together like a curve. Like a skin made from interpretation.”

Michio moved the tactical display into her personal data and reached out, turning herself with one handhold until she faced the crash couch. Josep gazed at her with an expression of childlike joy. His pupils were so dilated, his eyes looked black.

“Got to go do something,” she said. “You going to be all right without a babysitter?”

Josep chuckled. “Been a citizen of the mind since before you were born, child-bride. I can swim in vacuum and never die.”

“All right,” she said, and set the straps on the couch to restraint with her password as the release. “I’m going to set the system to watch your vitals. May have Laura come sit with you.”

“Tell her to bring her go set. Play better when I’m stoned.”

“I’ll tell her,” Michio said. Josep took her hand in his, squeezing her fingers gently. He meant something by it—something deep and subtle and probably not comprehensible by a sober mind. All she saw was the love in it. She dimmed the lights, had the system play soft music—harp and a woman’s voice so perfect she assumed it was artificial—and left him alone. On her way up to the command deck, she sent a message to Laura and got a response. Josep probably didn’t need a minder, but better to be safe. She laughed at herself as she steadied her ankle against a foothold. Safe in the little things, reckless in the big ones.

Bertold was in Pa’s usual crash couch, music leaking from the earphones on his head and the ship’s status monitors showing green and happy on his screen. Everything was fine as long as he didn’t look out too far.

He lifted his chin to her as she pulled herself into Oksana’s customary station instead. It still felt strange, being in a ship designed by Mars. It was all built with a sensibility she couldn’t quite put her finger on: military and rigorous and straight. She couldn’t help thinking it was because the designers had grown up with a constant gravity pulling them down, but

maybe that wasn't true. Maybe it was just Martian because Mars was like that. Not inners against outers, but the rigid and brittle against the flowing and free.

"Matter? Geht gut?" Bertold asked as she retrieved the tactical schematic.

"Fine. But Josep decided to get stoned, and I'm just not doing work that goes well with intoxicated mysticism."

She felt a stab of regret as soon as she'd said it, though she knew Bertold wouldn't take her snapishness as more than it was. Still, if the family fell apart in the middle of everything else failing, she wouldn't be able to do this. She needed her rock.

Good, then, that she had it.

"You mind if I ...?" Bertold asked, and she mirrored her display to his. All the ships, all their vectors. The final refutation of the one-ship. Here was humanity in all its fissures and disconnections. She went back to her analysis. Here was how to get a quarter of the lost resources back and only lose two of her ships. Here was how to deliver a tenth, but not to the people most in need. Here was how to keep her ships safe and achieve nothing else.

"Looks like an amoeba giving birth to twins," Bertold said. "Sehr feo."

"Ugly indeed," Michio said, running another scenario. "Stupid, wasteful, and cruel."

Bertold sighed. When they'd first been married, Michio had been deeply infatuated with him and Nadia both. Their shared passions had mellowed since then into an intimacy that she appreciated more than sex. It was the trust that let her say what she was seeing, what she was thinking. Let her hear the hard truth spoken in her own voice. "If we're going to do this, I'm going to have to do some things I don't like."

"Knew that going in, didn't we?"

"Didn't see the details."

"Bad?"

In answer, she flipped a variable in the tactical readout. New options opened that hadn't been there before: Recover sixty percent and lose nothing. Supply the five stations at greatest risk of collapse and keep Marco away from Iapetus. Open and possibly control a path to Ganymede for a few weeks at least. Bertold scowled, working out what she'd done and how

she'd done it. When he saw, he grunted.

"That's a dream," he said.

"It's not," Michio said. "It's an agreement, and two enemies willing to respect it as long as their interests align."

"It's putting your back to the Butcher of Anderson Station."

"Well, yes. It is that. But I know what he is. I won't make the mistake of trusting him. He'll use us if he can. I'd be stupid not to repay that in kind. If Marco wasn't putting us as his top priority, it would be different, but he's burning hard for our ships."

"Injured his pride, sa sa?"

"All we need is that the consolidated fleet agree not to fire on us and we don't fire on them, and it opens up zones where Marco won't follow. Safe havens."

"'Safe' meaning huddled underneath Fred Johnson's guns. Waiting for him to turn them on us."

"I know," Michio said. "And with Johnson, that time will come. When it does, we won't be there."

"This is a bad plan, Captain," Bertold said. His voice was gentle, though. He already understood.

"It is. It's the best bad plan I've got."

He sighed. "Yeah."

"Well," she said. "We could have done things Marco's way."

"Don't think we could have," Bertold said.

"Don't either."

"What about the stations and ships we're giving to? Some of them going to have guns. Have guards."

"Withhold aid unless they agree to fight and die for us?" Michio said. "Let them starve if they won't? No, don't. I'm not saying no to that. I'm asking. Which is worse? Extort people into being soldiers for us, or negotiate with Fred fucking Johnson?"

Bertold pressed a palm to his forehead. "No third side to that coin?"

"Die noble?" Michio said.

Bertold laughed, and then he didn't. "Depends on what the Butcher wants."

"It does," Michio said. "So we should ask him."

"Yeah, fuck," Bertold said. She saw her own dread and anger and

humiliation reflected in his eyes. He knew what even considering this was costing her. And the ruthlessness she treated herself with that made it necessary. “I love you. You know that. Always.”

“You too,” she said.

“Doesn’t take much before we have to compromise ourselves, does it?”

“Get born,” Michio said, pulling the comm controls and setting the tightbeam for Ceres.

Chapter Twenty: Naomi

The danger is overreach,” Bobbie said, hunching over the table and making it seem small. “They sucker-punched us. We got a couple easy wins coming back. It’s tempting to drive it as far as we can, and try to break them. Seems like we’ve got them on the back foot. But the truth is, we’re still sizing his forces up. He’s still seeing what we do.”

“And what are we doing?” Naomi asked, handing across a bowl of scrambled egg and tofu with hot sauce.

Bobbie scooped up a bite and chewed thoughtfully. Naomi sat across from her and tried a bite from her own bowl. Ever since Maura Patel had upgraded the food systems, the *Roci*’s hot sauce tasted a little different, but Naomi was coming to like it. There was a pleasure in the novelty. And also a sense of nostalgia for what had changed. That wasn’t only food. That was everything.

“I don’t think anyone knows,” Bobbie said. “My tactics teacher back in bootcamp? Sergeant Kapoor. He was an entomologist—”

“Your sergeant in bootcamp was an entomologist?”

“It’s Mars,” Bobbie said, shrugging. “That isn’t weird there. Anyway, he talked about shifting strategies like they were the middle part of metamorphosis. Apparently when a caterpillar makes a cocoon, the next thing it does is melt. Completely liquefies. And then all the little bits of what used to be caterpillar come back together as a moth or a butterfly or something. Finds a different way to assemble all the same pieces and make it something else.”

“Sounds like the protomolecule.”

“Huh. Yeah. Guess it kind of does.” Bobbie took another bite of her eggs, her gaze on the far wall. She was quiet for long enough that Naomi didn’t know if she’d come back.

“But he meant something tactical?” Naomi said.

“Yes. That pivoting your strategy was like that too. You go into a situation thinking about it a particular way, and then something changes. Then either you stick with the ideas you had before or you look at everything you have to work with and find a new shape. We’re in the find-a-new-shape part. Avasarala’s busy trying to keep what’s left of Earth out of environmental collapse, but once that’s stabilized, she’s going to try to capture Inaros and everyone else who ever breathed his air and put them all on trial. She wants it to be crime.”

Sandra Ip came in from the lift, nodded at the two of them, and pulled a bulb of tea from the dispenser.

“Why, do you think?” Naomi asked. “I mean, why treat it like a criminal act and not war?”

“I think it’s a statement of contempt. But in the meantime, Mars is ... I don’t know. I think it’s finding out that for all our strength, we were brittle. I’m not sure how we come back from that, but we’ll never be what we were. Not any more than Earth will. And Fred? He’s trying to build consensus and coalitions, because that’s what he’s been doing for decades.”

“But you don’t think he can.” It wasn’t a question. Ip left the galley, her footsteps retreating as Bobbie thought.

“I think putting people together’s a good thing. Generally useful. But ... I probably shouldn’t be talking about this. I’m supposed to be his representative for Mars. Junior league ambassador or something.”

“But he’s trying to rebuild his caterpillar when we need a butterfly,” Naomi said.

Bobbie sighed, took a last bite of egg, and tossed the bowl into the recycler. “I could be wrong,” she said. “Maybe it’ll work.”

“We can hope.”

Bobbie’s hand terminal chirped. She considered the incoming message with a frown. The way she moved, even little motions like this, had the strength and economy of training. And more than that. A frustration.

“Oh joy,” Bobbie said dryly. “Another important meeting.”

“Price of being central.”

“I guess,” Bobbie said, hauling herself to her feet. “I’ll be back when I can. Thanks again for letting me bunk here.”

As Bobbie stepped past, Naomi put a hand on her arm. Stopped her. She didn’t know exactly what she was going to say until she said it. Only that it

was tied up with the ideas of crew and family and trying not to betray who you were. “Do you *want* to do this junior ambassador thing?”

“I don’t know. It needs doing, I guess,” Bobbie said. “I’ve been trying to reinvent myself since Io. Maybe since Ganymede. I really liked working veterans’ outreach, but now that I’m not doing it, I don’t miss it. I figure this’ll be the same. It’s something to do. Why?”

“You don’t need to thank anyone that you’re bunking here. If you like that cabin, it’s yours.”

Bobbie blinked. Her smile was small and rueful. She took a half step away, but didn’t turn her body. The physical expression of hesitation. Naomi let the silence between them stretch. “I appreciate the thought,” Bobbie said. “But adding someone into a crew? That’s a big deal. I don’t know what Holden would think about it.”

“We’ve talked about it. He already thinks you’re crew.”

“But I’m doing this ambassador thing.”

“Yeah. He thinks our gunner is Fred’s ambassador from Mars.” Naomi knew she was stretching the truth a little there, but it was worth it. Bobbie was still for the space of a heartbeat. And then another one.

“I didn’t know that,” she said, and then with no other words, stepped back toward the lift, the airlock, Ceres Station. Naomi watched her go.

Fires on shipboard were dangerous. There were any number of ship processes that could rise up past the point of spontaneous oxidation. The trick was knowing when letting a breeze through would start combustion and when it wouldn’t. Sometimes talking to Bobbie was like putting her hand on a ceramic panel to see how hot it was. Trying to guess whether a little air would cool the big woman down or start up flames.

Alone in the galley, Naomi went through a little casual maintenance: wiping down the tables and benches, checking the status of the air filters, clearing the recycler feed. Having so many people on the ship left them running through supplies faster than she’d become accustomed to. Gor Droga’s fondness for chai drove down their supply of tea analogue. Sun-yi Steinberg preferred a citrus drink that ate into the acids and texturing proteins. Clarissa Mao ate kibble and water. Prison food.

Looking over the supply levels, Naomi had to remind herself that the *Roci* was carrying three times the crew it was used to. Still well within the ship’s specs and abilities. The *Tachi* had been designed for two full flight

crews and cabins full of Martian marines. Renaming it hadn't changed that. It had only changed her expectations. But they were still going to have to resupply again soon.

The aromatics and spices that kept everyone from eating like Clarissa were going to be hard to get. Supplies were thin on Ceres. Supplies were going to be thin all through the Belt, and now the inner planets too. Any of the complex organics that Earth used to supply could be synthesized in labs or grown in hydroponics on Ganymede and Ceres and Pallas. The touristy resorts on Titan. The problem, she thought as she replaced the injection nozzle on the coffee machine, was capacity. They could make anything, but they couldn't make it all at once. Humanity was going to get by on the minimum until there was a way to increase production, and a lot of people living on the margin wouldn't make it. They'd die on Earth, yes, but keeping the Belt fed wasn't going to be trivial either.

As she dropped the old injection nozzle into the recycler, she wondered if Marco had thought about that or if his dreams of glory had swept away any realistic plan for taking care of all the lives he'd disrupted. She had a guess about that. Marco was a creature of the grand gesture. His stories were about the single critical moment that changed everything, not all the moments that came after. Somewhere in the system right now, Karal or Wings or—thinking the name was like touching a sore—or Filip might be doing the same kind of maintenance she was doing on the *Pella*. She wondered how long it would take them to realize that the spoils of war wouldn't restock their ships forever.

Probably it wouldn't come clear until they'd used up everything. Kings were always the last to feel the famine. That wasn't just the Belt. That was all of history. The people who'd just been going about their lives were the ones who could speak to the actual cost of war. They paid it first. Men like Marco could orchestrate vast battles, order the looting and destruction of worlds, and never run out of coffee.

When the galley was done, she took herself back to the lift, and up to the command deck. There was new analysis of the ships that had gone missing in the ring gates. No new data, just a rechewing of the old. Her fascination came from a sense of dread. She'd been through those rings, traveled the weird not-space that linked solar systems, and of all the dangers she'd faced, just quietly vanishing away hadn't even been on her scopes. For a

few hundred people—maybe more than that—something else had happened. The best minds of Earth and Mars that weren't occupied with trying to deal with their environment and governing bodies collapsing around them were looking at this. Naomi didn't have their resources or the depth of background expertise they did, but she had her own experience. Maybe she'd see something they hadn't.

And so she looked. Like an amateur detective, she followed clues and hunches, and like most investigations like that, she found nothing. The new conversation on the feeds was a theory surrounding the *Casa Azul*'s drive signature showing that the reactor was probably misconfigured, but apart from it being a rookie mistake that transferred a lot of energy into waste heat, Naomi didn't see anything in it. Certainly no reason that it or the other missing ships should have gone dark.

The analysis had just shifted into speculation over the plausibility of failed internal sensors in the *Casa Azul* increasing the pressure from the reactor bottle—which was what she assumed from the start—when her hand terminal chimed. Bobbie. She accepted the connection, and Bobbie's face appeared on her screen. Naomi felt a twinge of alarm.

"What's the matter?" she said.

Bobbie shook her head. It was probably meant to defuse the tension, but it reminded Naomi of a video of a bull getting ready to charge. "Do you know where Holden is? He's not answering his comm."

"Might be sleeping. He was up late going over footage for his broadcast thing with Monica."

"Could you go wake him up for me?" Bobbie asked. The wall behind her was sculpted stone with recessed lighting. Naomi thought it was the governor's palace. Fred Johnson's distant voice, low and graveled by annoyance, confirmed that.

Naomi rose, taking the terminal with her. "On my way," she said. "What's going on?"

"I don't understand why you're part of this," Fred Johnson said.

Across the desk from him, Jim still looked sleepy. Puffy-eyed and his

hair still a little mashed from the crash couch. Bobbie, her arms crossed, sat off to one side. Before Jim could come up with an answer, she stepped in.

“He knew this Captain Pa,” Bobbie said. “Worked with her on Medina before it was Medina.”

“When she was in my chain of command,” he said. “She isn’t an unknown quantity. She was one of mine. I assigned her to that ship. I don’t need anyone telling me about who she is or what they think of her.”

Bobbie’s face darkened. “Fair enough. I got Holden here because maybe you’d listen to him.”

Jim raised a finger. “I don’t actually know what’s going on here,” he said. “So. You know. What’s going on here?”

“Michio Pa is one of Inaros’ inner circle,” Bobbie said. “Only it seems like she figured out that he’s a great big asshole, because she broke ranks. Started sending relief supplies places without the Free Navy’s say so. And now Inaros is shooting at her and she wants us to help her out.”

“Relief supplies?” Fred said, his voice hard as stone. “That’s what you’re calling them?”

“That’s what she’s calling them,” Bobbie bit back.

Jim glanced at Naomi. His expression said, *This is not going well.*

Naomi smiled back. *I know, right?*

“Michio Pa is stealing colony ships for the Free Navy,” Fred said. “Even if she isn’t complicit in the destruction of Earth, she has the blood of every colonist lost to her piracy on her hands. Those aren’t relief supplies. They’re the spoils of *war*. A war against us.”

“Marco’s shooting at her?” Jim said, trying to catch the conversation’s reins. But Fred was locked on Bobbie and he wouldn’t disengage.

“This is my best-case scenario, Draper. Inaros’ coalition is falling apart. They’re shooting at each other, not at us. If Pa degrades Inaros’ fleet, that means they’re that much easier for us to face. Every ship of Pa’s that Inaros turns to slag is one less that’s hunting down innocent people and stealing their property. There is no advantage to me or to Earth or to Mars that comes of getting involved in it, and I personally resent you calling in your friends here to try to bully me into thinking anything different.”

“You aren’t the only one here with military training,” Bobbie said. “You aren’t the only one who’s had to weigh taking on problematic allies. You aren’t the only one with command experience. But you are the one in this

room who's *fucking wrong*."

Fred rose to his feet, and Naomi pushed back into the cushions of her chair. Bobbie stepped toward the man, her hands in fists, her chin jutting. Fred narrowed his eyes.

"I am not interested—" he began.

"If you want me to come here and wear a Martian uniform and puppet back whatever you say, you got the wrong girl," Bobbie half said, half shouted. "You think your magic OPA coalition pajama party is going to step in here and fix this? It's failing. They aren't coming to you anymore. You got Ceres and you got a fleet and you got me as your goddamn window dressing, and it's not enough. Stop acting like it is!"

The words hit Fred like a blow. He rocked back a little on his heels, his lips pressed together. *Was it like this when Marco's coalition fell apart?* Naomi wondered.

When Fred spoke, his voice was quieter, but cold. "I see why Avasarala likes you so much."

"Is that true?" Holden said. This time they heard him. "The OPA isn't coming?"

"It's taking a little longer to arrange than I'd hoped. I may need to change venue for it. Find a place that's neutral territory."

"Neutral territory," Jim said, skepticism in his voice.

"Some of these people are lifelong enemies of the inner planets," Fred said. "The combined fleet makes them nervous. They need to be reassured that our whole focus is on the Free Navy and not them. That's all."

Fred and Bobbie stood awkwardly, the momentum of their anger spent but both resisting being the first one to step back from it. Naomi coughed, though she didn't need to, then rose and went to the sideboard to pour herself a glass of water. It was enough. Bobbie took her seat, and then a moment later, Fred did as well. Jim hunched in his chair. She poured a glass for him too and brought it to him when she sat back down.

"This Captain Pa?" Bobbie said, speaking now to Jim directly. "She's an in. If we can get her to where she's willing to provide intelligence for protection, she might be able to give us something we need to crack Inaros."

Fred shook his head. The anger was gone from his voice, but not the resolve. "Pa is a loose cannon. She has a history of mutiny and defection."

“The last time she mutinied, she saved my life,” Holden said. “And just maybe every human in existence. A little context here.”

“She isn’t coming to us as an ally. She isn’t offering to stop her piracy or even slow it down. Cooperating with her means every ship she hijacks from now on will be our fault too!” Fred punctuated the end of his tirade by slapping his thick hand on the table.

“She’s offering to give supplies to Ceres,” Bobbie said.

“That she stole—maybe killed—to get.”

Fred spread his hands, but Jim wasn’t looking at him. Naomi sipped her water. It was cold with the bite of minerals, and it did nothing to loosen the lump in her throat. She had to resist the urge to pluck her hair down over her eyes. Bobbie had brought him here as someone to fight beside her. Someone Fred Johnson knew and respected. But the Martian didn’t know Jim the way she did. Even loyalty—even love—wouldn’t let him compromise his sense of right and wrong. She wondered if Bobbie would stay on the *Rocinante* after this. She hoped so.

Anyone who didn’t know him better would have said he looked thoughtful. Naomi could see the grief in the corners of his mouth and the angle of his eyebrows. The sense of loss. She put down her glass. Took his hand. He glanced up at her like he was remembering she was there. She was looking into his eyes, and imagined that she saw a light within them go out. Or no, not out. Not extinguished. Only wrapped in something. Armor. Or regret.

“Okay,” he said. “How do we get in touch with Pa?”

Naomi blinked. Fred mirrored her surprise and confusion.

“You’re going to try to force my hand?” Fred said. “We aren’t going to do it.”

“You can pull your people off the *Roci* if you need to,” Jim said, nodding as if he were agreeing with something. Fred scowled in a way that said he thought talking to Pa himself might only be the second-worst plan on the table. “If we have to do this alone, we’ll be less effective. But we’ll do what we can.”

“We will?” Naomi asked.

He squeezed her fingers. “We’re going to need someone like her,” he said so gently it was like someone whispering a love song.

She wasn’t sure what he meant, and it didn’t make her feel better.

Chapter Twenty-One: Jakulski

Favór,” Shului said. “Won’t ask you nada alles. Only do this for me, sa sa?”

Jakulski shook his open hands, waving the younger man off. With Kelsey visiting the head, they were alone in Medina’s technical command center. Because it was outside the drum, it was one of the only places on Medina that was always on the float. The couches were bolted to what would be the floor if the station ever went under thrust again. Angels wearing blue and gold pushed archways toward a God who, with them on the float, seemed like He was looking at them sideways. The only part that made any sense to Jakulski was the stars.

Shului was a picture of despair: mouth twisted in distress, hands out before him, eyes imploring Jakulski. The thick, crusty sty on the upper lid of his left eye looked like something out of the Book of Job.

“Can’t,” Jakulski said. “Promised my team I’d buy tonight.”

“Will instead. Clear sus tab, y alles la,” Shului said. “*Favór.*”

It had been a long shift already, and the truth was, Jakulski was looking forward to sitting down someplace with just a little gravity and a decent scotch. And the white kibble at the café that Salis and Vandercaust usually went to reminded him of his childhood. The prospect of staying another half shift—and worse, another half shift wearing the pinché Free Navy formal uniform—so he could be part of the greeting ceremony in Shului’s place had no charm to it.

But the distress in the young man’s expression was hard to look at. If he was smart, he’d just keep saying no, and hold to it until Kelsey got back. It’d be easier if there were someone else there. Keep Shului from debasing himself. Can’t. Sorry. Be done.

“For for?” Jakulski said. “Just a greeting ceremony, yeah?”

Shului looked embarrassed and pointed to his infected eye. “Rindai

gonna be there. She sees this? Favór, brother.”

“Che! You still tasting her air? She’s not gonna bite you. Talk to her.”

“Will, will,” Shului said. “Only *after* esá bastard heals up, yeah?”

“Bist bien,” Jakulski said, shaking his head. Then, with a sigh, “Favór.”

He thought for a moment Shului was going to embrace him, but thankfully the young man only took him by the shoulders and nodded in a curt way he probably thought was manly. Being young was undignified. Being young and in love was worse. He’d been a pup himself once, filled with all the same lusts and fears that every generation suffered. That he’d grown out of them now didn’t mean he couldn’t remember what it had been like. And fuck, but that pus-caked eye was hard to look at.

He sent a message to the technical team—Vandercaust, Salis, Roberts—that he’d been called on for extra duty and that he’d meet them after it was done if he could. Vandercaust sent back a generic acknowledgment. That was probably all he’d get from them. But maybe he could sneak away from the ceremony quick enough to catch the team. Cover for Shului and not have the tech team feel like he was putting himself above them. Eat his cake and still have it after. It would be a tired night if he could get it all done, but some nights were tired.

People. No matter where he went, no matter what he did, it was all still people.

Kelsey came back from the head and took her place at the main crash couch with the angels looking beneficently down over her shoulder. When Jakulski said he needed to get off shift a few minutes early so he could get back to his cabin and change, Shului jumped in to say how it was all okay and he’d take care of anything that needed doing.

The transition from the command center at the top of the ship into the drum was a long, curving ramp, and Jakulski rode down it in a cart with wheels that gripped the decking at any g, all the way down to the inner surface of the drum, and then down from there, going under the false ground like a caveman driving down into the underworld. His own cabin was back toward engineering. If he’d known he was going to have to go meet the *Proteus* and the grandees from Laconia, he could have brought his good uniform at the start of shift and taken the lift that ran the length of the ship outside the drum, but leaving early was almost as good.

The body of the drum had been built spacious, more like a station than a

ship even from the start. Like it knew what it was destined to become. Long corridors with high ceilings and full-spectrum light like what used to fall on Earth before Marco threw a bunch of their mountains into their sky. He caught one of the diagonal halls, curving off toward his cabin on the hypotenuse of the drum's traffic grid, and let himself feel a little philosophical about the way the lights of Medina were like the memory of the species—an idea of brightness that had outlived the light that inspired it. The way Belters had. Belt-light. It was a pretty idea, and a little melancholy too, which made it even better in his mind. All beautiful things should have just a little sorrow about them. Made them seem real.

His cabin had been built for a single young Mormon living alone before marriage, but it was plenty enough for him. He stripped off his jumpsuit, tossed it in the recycler, combed his hair, and took his Free Navy uniform out of storage. He threw his image up on the wall screen to see how he looked. Fucking uncomfortable piece of cloth, the damned thing was. But for all that, he had to admit he did come over suave in it. Distinguished man, elder of his people, him.

To his surprise, he discovered that he was almost looking forward to this.

Medina had been on edge ever since word came through that Pa and her ships were rogue. But only a little. Everyone here had been OPA before they were Free Navy. And along with OPA, they'd been Voltaire Collective. Or Black Sky. Or Golden Bough. Or Union. Factions within factions within factions, sometimes with very different groups laying claim to a single name, was as Belt as red kibble and mushroom whiskey.

There was even a way that the split in the Free Navy was comforting. Not because it meant things were going well, but they were going to shit in a familiar way. Pa made a play for status; Marco was going to knock her back. Humanity still worked the way it always had. All the shooting was happening inside the orbit of Jupiter anyway. No one wanted it to spill out to the slow zone. If Duarte got nervous about it all, it was because he wasn't from here. Whatever he and his were doing on the far side of the Laconia ring, they'd been Martians when they went out and they were Martians still.

So Duarte wanted to send more resources to Medina? Good. He wanted to put advisors on the station, make sure the locals were all trained with the equipment he was shipping in? Good. More for Medina and everyone

happy. And plus all that, the *Proteus* was bringing it in. And everyone wanted to look at the *Proteus*. First ship to come in the gate that hadn't gone out through it first. A peek at whatever Duarte and his people were building out there. Given the choice, Jakulski would still have been in the café with his tech team, drinking a little too much and flirting. But since that wasn't happening, getting to see a little of the advisory force was okay for second place.

The *Proteus* had come through the gate earlier in the day, fast enough to coast to Medina without its Epstein and slow enough that its maneuvering thrusters could bring it into docking position down by the engineering decks. Jakulski'd heard rumors that the Martians were keeping the Epstein at a minimum so that no one could get a good look at their drive signature, but he didn't see how that made sense. Paranoia, rumor, and superstition was all. The *Proteus* might be one of the first ships built at a shipyard on the far side of the rings, but it was just a ship. Wasn't like they were flying there on the back of a dragon.

Captain Samuels—in charge of Medina because she was Rosenfeld Guoliang's cousin, but a good administrator anyway—was at the lock in full Free Navy military dress. Jon Amash representing for security. And there, with her auburn hair in a braid and eyes the same soft brown as her skin, Shoshana Rindai for systems. Shului had a point, that one. If Jakulski had been thirty years younger, he could have seen developing intentions toward her too.

Samuels scowled at him, but not in a way that meant anything. “You're for technical?”

Jakulski lifted an affirming fist and took his place in the line of floating grandees, ready to show the Marteños that the Free Navy was just as much a tight-assed military as the next coyo over. Medina had been meant for a generation ship once, and it still showed in the ship bones. Not much call for greeting visitors out in the wide nothing between stars, so the engineering lock opened onto a bare, functional decking with LED-white worklights and a rack of yellow-and-orange construction mechs on one wall. The air smelled of spent welding fuel and low-foam silicon lube.

Rindai glanced at him, lifting her chin in greeting. “For for Shului not come?” she asked, but before he had to come up with an answer, the lock cycled, and the Martians came in. Jakulski's first thought, quick as a reflex,

was that they looked pretty unimpressive for great saviors.

The captain of the *Proteus* was a dark-skinned man with wide-set eyes and broad, expressive lips. His uniform was Martian, except for its insignia. Not taller than Jakulski, probably, and comfortable moving in zero g. The six behind him were in civilian jumpsuits, but the broadness of their shoulders and the cut of their hair said they were as military as the captain no matter what they were wearing. Samuels nodded, but didn't salute. The *Proteus* coyo caught his ankle in a floor hold and pulled himself to a stop as gracefully as a Belter.

"Permission to come aboard, Captain?" he said.

"Glad to have you here, Captain Montemayor," Samuels said. "Esá es my department heads. Amash. Rindai. Jakulski. They're to help you with constructing and arming the security base."

Security base? Jakulski sucked in a long breath. Not something Shului had mentioned. He wondered if not wanting Rindai to see his infected eye had been bullshit and he'd just wanted someone else to pick up the project. Just as likely Shului hadn't even known ...

"Not at all, sir," the *Proteus* man—Montemayor, she'd called him—said. "We're here to help *you*. Admiral Duarte specifically told me to assure you that we have the utmost faith in your ability to address any instability that might come from Sol system. We just want to assist and support our allies in Medina as best we can."

"Appreciate that," Samuels said, and it could just have been Jakulski's imagination, but she did seem to relax a little. Like maybe she'd been expecting this to be less pleasant and was relieved that the Martian coyo had started by showing his belly. Jakulski looked over the other six, wondering which of them he'd be working with and what exactly they'd be working on.

"Come you, have a drink," Samuels said, clapping Montemayor on the arm just as if they were friends. "We'll get you an escort to your quarters."

"It's Callisto all over again," Roberts said.

"You weren't even born when Callisto had trouble," Salis replied. "Que

Callisto all over again?”

Jakulski leaned back, pressed to the ground by the spin of the drum. Somewhere five levels below their feet, a quarter of a klick aft, and maybe ten degrees spinward, his cabin waited and with it, his comfortable clothes. After the Martians had all been greeted and drunk to and made welcome and all, he'd hurried to the café, thinking maybe he'd be able to catch the technical team before they went home. He hadn't taken the time to stop and change clothes. So now the uniform, even undone at the throat, sanded his neck.

The technical team had all been there, and still were. Planted in their chairs like they'd taken root.

“Don't have to have been there to know what a proxy war is,” Roberts said. “My family's Callistan, three generations. I know what it looked like, even if I wasn't there. Earth sends private security. Mars sends advisors. Everybody just there to help out this union or that trade group, but what it came down to was Earth and Mars spending Belter lives so they never had to risk their own.”

He'd expected the place to be empty. It was long after his shift, well into when he should have been spinning down for sleep. But the light of the straight-line sun was bright and high, and even after generations in the black, some atavistic part of his brain still told him that meant midday. Drum time was permanent noon, first and last and always. And with the overlapping shifts that kept Medina alive and working no matter what the clock pretended, there were people coming in for an early breakfast or a late lunch, grabbing a quick drink on the way back to their cabin. Or like him and the technical team—burning the midnight oil. All at the same time. It was the drift of humanity left to live on whatever schedule they chose instead of being chained to the twenty-four hours of Earth and Mars. Belter time.

“Maybe if they'd come on their own, yeah,” Salis said. “Could see it then. But that's not the way I heard it.”

“The way you heard it?” Roberts laughed. “Didn't know you had your cameras in the bedrooms of power. Inside scoop, you?”

Salis made a rude gesture, but he was smiling while he did it. Jakulski took a drink of his beer, surprised to find the bulb so close to empty already.

“Friends in comms, me,” Salis said. “What I heard was Marco asked

Duarte to come. Not Laconia coming to pull our puppet strings. It's them dancing to a Free Navy song."

"The fuck would they do that for?" Jakulski asked. He sounded like Roberts, like he was busting Salis' balls, but he more than half wanted Salis to talk him into agreeing. In his fatigue, Jakulski couldn't stop imagining the six advisors in their civilian clothes and martial bodies.

"Same reason start storing your casino chips someplace new when your boyfriend moves out," Salis said. "Think on it, yeah? Michio Pa was one of his five. High up. Maybe Marco kept her out of the loop on Medina, only ran that through Rosenfeld. Maybe everyone knew a little of everything. Now Pa's making her play, it's only smart to change it up. She thinks she knows how the rail guns are protected? So he changes how the rail guns are protected. Simple."

"Or now Marco and Rosenfeld and Dawes are distracted, Duarte moves his 'advisors' in place so when he wants to, he can point the rail guns at Medina, tell us all what we should make him for breakfast," Roberts said.

Jakulski lifted a hand, caught the server's eye, and pointed to his spent bulb. One more wouldn't do any damage that wasn't already done. And all of it was going on God-damn Shului's tab anyway. Best make it count. Vandercaust, across from him, noticed and raised his own bulb as well. The server nodded with her hand and went back to what she'd been doing. A bird with wings as wide as Jakulski's outstretched fingers skinned past them, a fluttering and a flash of blue. It rode the breeze like it was still on a planet that curved down at the horizon instead of up. There was something wonderful about air wide enough to fly in.

"Say you?" he asked, looking at Vandercaust.

"Not saying nothing, sa sa?" the oldest tech said, scratching idly at the split-circle tattoo on his wrist. "Drinking."

Jakulski narrowed his eyes. Curiosity shifted sluggishly in his brain. He was too tired. He should go back and sleep. But the server was on her way with two fresh bulbs, and he'd made the trip so he could be with the team. "Best guess, then. Duarte pushing pawns to get control of Medina? Marco using Laconia against Pa? What are we looking at?"

"Best guess is I don't fucking know," Vandercaust said in an amiable voice, and gestured in a controlled way that made it clear he was very drunk indeed. "It's a war. Wars aren't like that."

“Aren’t like what?” Roberts said.

“Aren’t like stories about wars,” Vandercaust answered solemnly. “Stories about wars come after. Like Qin Shi Huang unified China or when you look and say this led to this led to this, and then it was over. How did anything begin? War start when Marco hit Earth? When Earth hit Anderson Station? And it ends when Earth and Mars are dead? When Belters have a home? When everyone agrees it’s done?”

Roberts rolled her eyes, but Salis leaned forward, fingers laced across his knee. Jakulski took his new bulb from the server and drank. It was cold and rich, but something made him a little sorry he’d stayed to drink it. Martians on Medina, and Pa running her own crew, and Fred Johnson taking Ceres back. It all felt like someone building the solar system’s biggest mousetrap. And Jakulski thought maybe he was living inside the cheese.

Chapter Twenty-Two: Holden

It hadn't really been that long since Fred had crewed up the *Rocinante* for its burn down to Luna, but it had also been a lifetime. Now, with the Tycho-based crew gone, the ship seemed bigger. Emptier. It was like the end of a really long party when all the guests have gone home, and Holden couldn't quite decide if it left him feeling lonely or relieved. When they headed out this time, they'd only have one pilot. One engineer. Still two mechanics, assuming that was Clarissa's official title. After flying with the *Roci* for so many years with just his little family, it was strange to feel the loss of that redundancy, but some deep training was still there in the back of his mind saying that everyone had to be replaceable. As if keeping Chava Lombaugh on the ship would have really made it bearable losing Alex to a badly placed PDC round or a stroke during a high-g burn or any of the other thousand things that could go wrong in space. As if Sandra Ip could ever have taken Naomi's place.

On one hand, it was unthinkable. On the other, it was reasonable. Alex was Alex, and no one else would ever be. If something did go wrong, though, they'd want a pilot. And the chances of things going wrong seemed pretty high.

The *Minsky* had started its life burning out of Luna with colonists funded by Royal Charter Energy. The same company that had landed on Ilus and Longdune and New Egypt. If things had gone the way they'd intended, they'd have passed through the ring gates on their way to landfall in a system called San Esteban. Instead, they'd been taken over by the *Serrio Mal*, looted, and were in a braking burn toward Ceres with what was left of the crew and supplies after Michio Pa and her people were done with it. Food and water, hydroponics and medical supplies, construction mechs and scientific equipment and the people to use them. And burning at its side, a Free Navy gunship as escort. Probably one of Pa's. Probably not a

trap.

Probably not going to get reduced to radioactive gas by Fred. But only probably.

Alone on the command deck, he had the *Roci*'s inventory schematic pulled up on the screen and the latest edited piece from Monica spooling on his hand terminal. The inventory chirped and updated. It took him a second to find the new data.

"Alex?"

"Right here, Hoss," Alex replied, his voice coming through the comm and down from the cockpit both.

"Confirm that you're seeing the juice on your couch topped up?"

A moment passed. "I am showing full-on shitty synthetic juice guaranteed to give a migraine and diarrhea if you use it for more than eight hours."

"Seriously?"

"We had better than this on the *Canterbury*," Alex said.

Holden felt a twitch of concern. "Why did we get third-rate juice?"

Naomi answered as if she were beside him instead of strapped into the loading mech on the dock. "Because the alternative was loading the injectors with morphine so you don't care so much about being crushed. There's a war on, you know."

"So there is," he said as the inventory chimed another update.

Amos said, "Should show we're at eighty percent on PDC rounds."

"Showing eighty-one point seven," Holden said.

"Really? I'm pretty sure that ain't right."

"Track it down," Holden said. "I'll let you know if the ship changes her mind in the meantime."

"We're on it," Amos agreed.

We. Meaning Clarissa. He was really going to have to get over that. He felt guilty that he hadn't already, but he didn't have a clear idea how to let his discomfort with her go. He pushed the issue back down his priority list again, the way he always did. And who knew? Maybe they'd all die in a hail of gunfire before it came up again and he wouldn't have to worry about it.

On his hand terminal, the new edit of latest video flickered. This would be the tenth one when it came out. Most of it was an interview with a

couple of musicians he'd met up in the shitty part of the station. Two Belters with patois so thick, he'd fed it through a translation program, but their voices were musical and there was an affection in them that transcended the language. Monica had redone the subtitles, putting them at the top of the image, so that the words were beside their faces, close enough to see their expressions as they spoke. They looked like grandfather and grandson, but they called each other "cousin."

As he watched, they talked about the music scene on Ceres, the difference between live music and recordings, between what they called *tényleges* performance and using microphones. They didn't talk about Earth or Mars, the OPA or the Free Navy. Holden hadn't asked, and the few times that they'd strayed in a political direction, he'd brought it back to the music. Two more reminders that not everyone who lived outside a gravity well had dropped the rocks on Earth. He liked this one a lot, and he wanted to get it approved for release before they left dock. *In case*, without ever quite letting himself think in case of what. Just *in case*.

The first nine pieces he'd released had gotten a little traction. Some of that was, he knew, because his name was on it. Being a minor political celebrity had its perks, and one was a small but reliable audience baked in for this project. Better than that, though, he'd started getting copycats. People with their own feeds on Titan and Luna and Earth doing interviews and slice-of-life bits like the ones he'd put out.

Or maybe they'd always been doing that, and he was copying them. Only he hadn't noticed any of it until now.

"Cap?" Amos said, and Holden realized it wasn't the first time. "You okay up there?"

"I'm here. I'm fine. Distracted. What've you got?"

Clarissa answered. "One of the feeds didn't zero before. We got it. The count's confirmed."

"Great," Holden said. On his hand terminal, the older man struck a chord on his guitar and the younger man laughed. He closed the file. He couldn't tell if it was working or not anymore. His brain couldn't imagine what it would be like to run into it for the first time. Whether the humanity that he saw in it would be there for someone on Earth or Mars or in the colony ships. Or on the far side of the gates.

He heard Naomi coming up before he saw her. He looked back over his

shoulder as she stepped off the lift. Her jumpsuit still showed lines of sweat where the loading mech's straps had held her, and when she leaned over to kiss his forehead, he took her arm. Her eyes were a little bloodshot, the way they got when she was tired. She looked back down at him, laughed a little.

"What?"

"You're very beautiful," Holden said. "I hope I tell you that often enough."

"You do."

"Then I hope I don't tell you so often it gets annoying."

"You don't," she said, and sat in the crash couch beside his, stretching her arm as she did so she could keep her fingers twined in his. "Are you all right?"

"A little exhausted."

"Just a little?"

"I'm not hallucinating yet."

Naomi shook her head. Just a few millimeters one way and then the other. "You know you're not responsible for fixing everything."

"Saving humanity from itself is a group project, yes," he said. "Really, all I'm doing is trying to show everyone on Earth and Mars and the Belt and Medina and the colonies that really we're all still just one tribe."

"So just transcend all lived human experience since before the dawn of history?"

"And keep the part where we kill each other to a minimum," he said. "Shouldn't be hard."

"At least you know why you're tired."

She squeezed his fingers and let them go, pulling up a tactical display of Ceres and the space around it. The station itself and the fleet ships that surrounded it like a cloud of blue fireflies were marked as friendlies. The colony ship and its escort slowing toward them were in yellow—status unknown, but of interest. The time to rendezvous was down to hours.

"Part of me hopes that Fred won't let us go out," he said. "We request the clamps come off, and they just say no and we're stuck in here."

"While the colony ship flips at the last minute and accelerates into the port, exploding in a nuclear fireball," Naomi said.

He pulled up his hand terminal and sent his approval to Monica on Tycho. At lightspeed, it would still be minutes before she got it. "It does

sound less appealing when you put it that way.”

Behind them, the lift cycled down, humming as it went. Alex—his voice still doubled by the headset and the free air—finished his checklist with Amos and Clarissa. Holden stowed his hand terminal in the crash couch’s high-g compartment. If things went poorly, he didn’t want it zooming around the command deck.

Naomi’s voice was low, but focused. “Can I ask you something?”

“Of course.”

“Why are we doing this?”

Holden wished his brain had been a little clearer. After a certain point, he felt like his verbal centers ran straight to his mouth without passing through the rest of his brain. “Because we can’t just blow up enough things that this becomes a good situation. We’re going to need more than that in our toolbox.”

Bobbie stepped off the lift. There was something odd about her, but he couldn’t put his finger on it. She was wearing simple blacks, but the way she held herself made them look like a uniform. Her hands were in fists at her sides, but she didn’t seem angry so much as nervous. That didn’t bode well.

“Hey,” Holden said.

“Sir.”

“Please don’t call me sir. No one on the ship does. Everything all right? Fred want something?”

“Johnson didn’t send me,” Bobbie said. “You’re going out, and I’m reporting for duty.”

“Okay,” Holden said. “You can route tactical and fire control down here, or take the gunner’s seat up by Alex. Wherever feels most comfortable.”

Bobbie took a deep breath and something Holden didn’t understand played out across her wide face. “I’ll take the gunner’s seat,” she finally said, and climbed up to the cockpit. Holden watched her ankles disappear above him, his brow furrowed hard enough to ache a little.

“That was ... um,” he said. “Was that a moment?”

“That was a moment,” Naomi said.

“Good moment or bad moment?”

“Very good moment.”

“Well. Shit,” he said. “I’m sorry I missed it.”

“All right, everyone strapped in?” Alex called.

One by one, the crew answered. They were ready. Or as ready as they were likely to get. Holden let his head sink into the gel of the couch, shifting his screen to match Naomi’s. There were an awful lot of ships floating in the vicinity of Ceres right now. He listened as Alex requested that the docking clamps be released. For long, painful seconds, Ceres traffic authority didn’t answer. And then, “Affirmative, *Rocinante*. You are cleared to leave.”

The ship shuddered and the spin gravity of Ceres vanished as Alex let their momentum fling them out into the vacuum. On his screen, they were a white dot flying off at a tangent to the station’s massive curve. He flipped to external cameras and watched the surface of the dwarf planet curve away.

“Well,” Naomi said. “Looks like Fred didn’t object to this enough to keep us from going out.”

“Yeah,” Holden said. “I hope he knows what he’s doing, trusting delicate work like this to agents of chaos like us.”

Amos chuckled, and Holden realized he’d said that on the full-crew channel.

“Fairly sure he’s making this shit up as he goes too,” Amos said. “Anyway, the worst-case scenario is we all get killed and he gets to feel smart for not having his people on board when we did it. Win-win for him.”

When Bobbie spoke, Holden could hear the smile in it, despite the words. “No one dies while standing watch without permission from the commanding officer.”

“You say so, Babs,” Amos replied.

“Keep braced,” Alex said. “I’m gonna have to get us on course here.”

Normally the shifting of the ship under maneuvering thrusters was almost subliminal to Holden. The subtle dance of vectors and thrust had been part of his life ever since he’d left Earth. It was only that he was so tired and worried and full of so very much coffee that it bothered him. With every adjustment, up and down changed a little and then went back to the float. When Alex fired the Epstein for a few seconds, the *Roci* sang, harmonics ringing through overtones up and down the hull like a church bell.

“Not too much, Alex,” Holden said. “We don’t want our braking burn to slag anybody. At least I don’t think we do.”

“Not a problem,” Alex said. “We’ll just tap back down to a good coasting speed until we’re right up alongside them. Final braking won’t catch anyone in the plume.”

“And keep the torpedoes and PDCs hot,” Holden said. “Just in case.”

“On it,” Bobbie said. “We’re getting painted by ranging lasers.”

“Whose?” Holden asked, dropping the exterior camera and going back to tactical. The scattering of fleet ships. The surface defenses of Ceres. The slowly approaching captured ship and its Free Navy escort.

“Oh,” Naomi said, tapping through a list of connection reports longer than her screen. “Pretty much everyone.”

“The escort ship?”

“They’re painting us too.”

On his screen, the incoming ships stuttered, the data around them updating as they killed their braking burns, appearing from behind clouds of superheated gas. The *Roci*’s sensor arrays checked contour and heat signatures, confirming almost instantly. The larger ship matched the *Minsky*—large, blocky, and awkward with communications satellites meant to bootstrap a network around an alien planet covering its sides like warts. The smaller was a Martian corvette, a generation newer than the *Roci*, a little lighter, streamlined for atmosphere and probably loaded with similar ordnance. Its transponder wasn’t answering.

“Hate seeing this,” Alex said. “Two good Martian-built ships squaring off? It ain’t right.”

“Well,” Holden said. “Who knows? Maybe we’re on the same side.”

“If it is a fight,” Bobbie said, “let’s win it. Permission to lock target?”

“Has it locked on us?” Holden asked.

“Not yet,” Naomi said.

“Hold off, then,” Holden said. “I don’t want to go first.”

An incoming comm request appeared on his screen from Fred Johnson, and for a confused half second, he wondered what Fred was doing on the gunship, then saw the tightbeam was coming from Ceres. When this was over, he was really going to need to sleep. He accepted the connection, and Fred appeared in a separate window on the side of his screen.

“Regretting this yet?” Fred asked.

“Only a little,” Holden said. “You?”

“I want to make something clear. If—if—you take possession of that

colony ship, under no circumstances does it come within three thousand clicks of my dock. If there are people who need medical assistance on board, they stay on board and we'll send help out to them. Nothing comes off that ship until it's been examined, scanned, reloaded, disinfected, and sprinkled with holy water by whatever flavor of priest I can put my hands on. I'm not running Troy here."

"Understood."

"The only reason I'm letting you do this at all is the chance of recovering prisoners of the Free Navy alive."

"That's the only reason?" Holden said. "So you'll hand all the supplies on the ship back over to the former owners instead of using them to keep Ceres alive?"

Fred's smile was gentle and warm. "Don't be an asshole."

"Okay," Bobbie said. "Now they're painting us. Permission to return the favor?"

"Granted," Holden said.

Bobbie said something under her breath that he couldn't make out, but it sounded happy.

"Be careful, Holden," Fred said again. "I don't like anything about this."

"Well, if it's a trap, you can say I told you so to whatever scraps of us are left."

"I've got thirty ships that'll make sure you have a nuclear funeral pyre big enough they'd see it on Proxima Centauri in four years. You know. If anyone's there."

"That's not comforting," Holden said.

"We should open comms," Naomi said.

"Fred? I've gotta go do this thing. I'll let you know how it went when it's done."

Fred nodded. The connection dropped. Holden swallowed past the tightness in his throat. "How are we for range?"

"Inside effective torpedo range," Bobbie said. "And we'll be good for PDCs in eight minutes and ten seconds."

"Rail gun all warmed up?"

"Oh hell yes."

"All right," Holden said. "Naomi, get me a channel."

A moment later, a new frame appeared on his screen. Dark but with the

yellow border of an open connection. They were so close, there was effectively no light delay. That alone made him nervous.

“Attention, unidentified warship. This is James Holden of the independent freighter *Rocinante*. We’re here to transfer possession of the *Minsky*. Hope that’s what brought you here too. I’d appreciate it if you’d identify.”

The screen stayed dark. Anxiety crept up his back. The seconds stretched without a reply. Something was wrong. Without moving, he rehearsed what he’d say to Alex. *Get us out of here. Something’s about to blow up.* What he’d say to Bobbie. *Protect the Roci first. Disable the gunship if you can. Kill it if you have to.*

The frame flickered. For a fraction of a second, an unfamiliar blond woman with sharp features appeared, and then immediately the image shifted to a woman with dark hair tied back. A small, cynical smile on her lips. Holden realized he’d been holding his breath and exhaled.

“*Rocinante*,” she said, “this is Michio Pa of the *Connaught*. Weird to see you again, Captain Holden.”

Chapter Twenty-Three: Pa

The *Munroe* died second. Marco's forces caught it near a cloud of machining equipment and medical supplies that had been buried in the void. As best Michio could reconstruct it, a plea for help had come from a mining ship called the *Corvid*. They had five families on the ship, and an outbreak of complex meningitis that had the children in medical comas. The *Munroe*, charging to the rescue, was intercepted by two Free Navy corvettes, and fled from them into two others. Marco had recorded the captain—a middle-aged man named Levi Watts who Michio had hardly known before he was placed under her command—begging for the life of his crew before his ship was overwhelmed.

It hadn't been dignified, and it ended in fire. Copies of it went on a dozen anonymous feeds with an attached listing of all the other vessels that had chosen to follow her.

The *Corvid*'s transponder vanished. The discussions of whether it had also been destroyed or invented as bait for the ambush came to nothing. The message was the same either way: No one could betray the Free Navy, and the Free Navy was Marco Inaros. Evans and Nadia had taken the responsibility of remaking the communication protocols for Michio's remaining fleet. She could see the concern in their eyes and hear it in the timbre of their voices. She loved them for caring, but there was a distance in that love for now. A coldness. She couldn't say how long her rage and grief would stay cold, but for now ruthless analysis was the only way she could mourn.

Maybe that was what worried them.

The *Minsky* had been flying dark outside the ecliptic in an orbit that, given several months, would have taken it near enough to the ring gate that it could have made a break for it, dodged into the slow zone before any of the Free Navy ships could intercept it. So when Foyle and the *Serrio Mal*

captured it, she'd also saved the lives of everyone aboard. It would have been a matter of minutes between the ship passing through the gate and rail gun defenses ripping it to pieces. Not that the colonists knew that. Not that Michio had told them.

Even when Foyle learned that the prize ship was being routed to Ceres and into the arms of the enemy, she'd been willing to escort it. Michio had been tempted to let her, but it was the wrong move. Reaching out to Fred Johnson had been her decision. If it was going to go pear-shaped, she should be the one to deal with it.

The transfer had been furtive and quick—high-g, short-burst burns that brought the *Minsky* and the *Connaught* together on an intercept with Ceres that kept away from the bulk of Marco's forces.

When, a lifetime ago, Marco had chosen her to head the conscription arm of the Free Navy, he'd given her the smaller, lighter ships. Armed, certainly, but not built for heavy fighting. She was meant to outrun the vast, bulky ice haulers, converted now to colony ships: massive and easy to overwhelm. Marco and Rosenfeld, the war leaders against the inner planets, had more need of the capital ships. They were the sledgehammer, and she was the scalpel.

And now she was going to find out whether her plan to cut a path where the great Marco Inaros couldn't reach her had worked, or if her rebellion was going to be short-lived and tragic.

The universe has plans for you, Josep said in her imagination. *You couldn't have come this far through so many dangers if there weren't a reason for you to be here.*

The same beautiful bullshit that everyone told themselves. That they were special. That they mattered. That some vast intelligence behind the curtains of reality cared what happened to them. And in all the history of the species, they'd all died anyway.

"Attention, unidentified warship. This is James Holden of the independent corvette *Rocinante*. We're here to transfer possession of the *Minsky*. Hope that's what brought you here too. I'd appreciate it if you'd identify."

"Well, fuck," Michio said.

"Captain?" Oksana said.

James Holden. Probably the most ambiguous man in the system. The

Earther who worked for Fred Johnson's OPA. The leader of the coup against Ashford back in the slow zone. The man Marco Inaros hated more than anyone else. Chosen envoy of the Martian Republic and the United Nations to Ilus, and everybody's favorite pawn. If she'd had a dream that his voice would be the one greeting her, Josep would have called it a sign. Of what, she couldn't guess.

Her display showed Ceres Station, the enemy ships arrayed around it like a cloud of insects waiting to attack. And all through the system, she was certain sensor arrays and optical telescopes were focused on her, on the *Minsky*, and on the ship coasting toward her.

Somewhere, Marco was seeing her with the chance to open fire on James Holden. If God had wanted to give her a way to walk back her rebellion, He couldn't have made a better one. She had her ranging laser on him. Even if she died, even if they all died, the other ships in her command would have a chance to sneak back into the Free Navy's fold. No more *Witch of Endors*. No more *Munroes*.

There are no coincidences, Josep said in her mind. Except of course there were.

"Captain, what are your orders?" Oksana asked.

"Open the connection."

Oksana opened the comms, grunted at some small error, and passed the feed to Michio's station. Holden was looking anxiously into the camera. The years had been kind to him. His face had a more comfortable look, and a touch of sorrow and humor that he wore well. She wondered if the others of his crew were still on the *Rocinante* with him or if he'd left Naomi Nagata someplace safely out of Marco's reach.

"*Rocinante*, this is Michio Pa of the *Connaught*. Weird to see you again, Captain Holden."

His lips widened into a boyish grin, and to her surprise, she found herself smiling back. It wasn't pleasure, but the giddiness of fear. Her heart tapped at her ribs like it was impatient. Trying to get her attention. *I could kill him. He could kill me. Either decision would be justified.* The *Rocinante* had a rail gun. By the time she knew he'd fired, she'd already be dead. But he probably wouldn't. And she probably wouldn't either.

"Weird to see you too, Captain Pa. Strange times."

She laughed, and it sounded like someone else. Evans looked at her,

concern in his eyes. She ignored him.

“Couldn’t help noticing that you’ve got some ships pointing their guns at me,” she said lightly.

“People are nervous,” Holden said.

“Was sending you supposed to be symbolic of something?”

“Nope. We just drew the short straw.”

It was eerie, speaking to someone on the other side of the fight without so much as a stutter of light delay. She wanted to flip and burn hard, get out. Every second on the float brought her closer to Ceres and the consolidated fleet and Fred fucking Johnson. Every dot on the tactical display made her itch. They were the enemy as much as Marco. But the enemy of her enemy was at least playing nice right now.

No sudden moves. Nothing without warning. They could do this.

“We’re ready to transfer control of the *Minsky* to you,” she said. “Her passengers are all on board confined to their quarters. I’ll send along a manifest with what supplies she’s carrying.”

Holden nodded. “So. Nothing’s going to blow up when we do this, is it? No booby traps? Because there are some smart people who think I’m pretty stupid for trusting you.”

“Plenty on my side saying the same of me. Nothing either of us can say right now’s going to change their minds. We’ll just have to try this. See what happens.”

Oksana’s voice cut through the air like a wire. “I’ve got fast-movers coming in from Ceres! Six torpedoes. Fifty seconds to impact.”

The breath left Michio’s lungs, pushed out by fear so profound it felt like calm. *Open fire, all guns. Get us out of here.* Whatever they were going to do, she had to order it now.

Except she was looking at Holden, and he was surprised too. Shocked, even.

Angry.

She had to give the order. She had to fire. Her family was going to die. If she fired, they’d all fire back. She had to run. Burn hard. Melt everything behind her to slag.

Stop, she thought. *If we die, we die, but right now, stop.*

Why was Holden angry?

“Holden?” she said, her voice trembling. “Do we have a problem?”

“Fuck yes, you have my permission,” Holden snapped, and it took her a fraction of a second to realize he wasn’t speaking to her.

“The *Rocinante*’s firing its PDCs,” Oksana said, her voice high and sharp. Fear was a resonance tone, and the deck rang with it.

“Lighting up our PDCs,” Evans said.

“Don’t,” Michio shouted before she knew she was going to say it. Then, in the stunned silence, “Touch those fire controls, and you will kill us all. Do you understand, Mr. Evans? Everyone you love will die, and it will be your fault.” Her husband looked at her, confusion in his eyes. His fingers hovered over the controls, twitching toward them. If she’d shot him, he couldn’t have looked more betrayed. “Oksana, what is the *Rocinante* firing on?”

“No no no,” Holden said. “We’re getting *them*. Not *you*. You don’t think we’re—”

“They’re targeting the missiles from Ceres. Impact in ... They’re done, sir. The *Rocinante* shot down the attack.”

Michio nodded. Her blood rattled in her veins. Her hands shook. She was aware of the panic in her mind like listening to voices in a nearby room, but she didn’t feel it. She didn’t feel anything.

“Evans,” she said. “Put your hands down.”

Evans looked at his own fingers like he was surprised to see them there, then slowly lowered them to his sides. She watched the realization bloom in his eyes: If he’d started firing, the enemy fleet would have started firing. Maybe not the *Rocinante*, but everyone else. His instincts had come within a finger-tap of killing them all. He moaned the way he did when he was sick or drunk, unstrapped, and pushed off. His crash couch spun gently on its gimbals as he abandoned his post. She didn’t stop him.

On her screen, Holden was bending in toward the camera. Not much, just the little unconscious curve of someone protecting their gut. She forced her own spine to relax. Long seconds passed as she waited for another attack. Heartbeat after heartbeat, nothing came.

“Well,” she said.

“Yeah,” Holden replied.

Another moment passed. Michio heard another voice behind Holden. Naomi Nagata. The words themselves weren’t clear, but the tone of the woman’s voice could have stripped paint. So he hadn’t left her someplace

safe. Fair enough. Safety might not exist now anywhere. The first hints of adrenaline crash haunted the edges of Michio's consciousness: a faint nausea, a deepening weariness, sorrow. She ignored those too.

"Was saying," Michio said, her voice calmer than she'd expected. "We have the *Minsky* and what she's carrying. Ready to pass control over to you. Then we're backing away before anyone else starts shooting at us."

"That wasn't Fred," Holden said. "I don't know who fired those torpedoes, but we're going to find out."

Michio's lips felt heavy, solid, like she'd been carved from stone. It didn't matter who'd pulled the trigger on the attack from Ceres. Look far enough back, and Marco Inaros would be behind it.

"I appreciate that," she said. "You let us know when you're ready for the remote command protocols."

Marco's response didn't take an hour. He shook his head sorrowfully, looked into the camera with wide, dark eyes. The raw charisma of his presence was banked by being on a screen, but it wasn't extinguished. Proof that the traitor Michio Pa was working with Earth. Undermining the efforts of the Free Navy to protect and rebuild the Belt. Brazenly giving aid and comfort to the enemy. His voice vibrated with indignation on behalf of his people and disgust for her collaboration with the enemy. It didn't matter that the "enemy" included millions of Belters he'd left behind. She wondered whether that would matter to the people who watched him.

He included images of the *Rocinante* defending the *Connaught*. The final proof, if anyone needed it, that she was in bed with the people who most wanted the Free Navy and the Belt to fail.

She watched it on the command deck, a dozen responses competing in her head. She even went as far as recording one, but the words got away from her, tugged along by her anger until the woman looking back at her from the screen seemed almost as crazed as the one Marco described.

They burned away from Ceres, but not hard. The point of the exercise was to put themselves in range of the inners and not be killed. To show the other ships still loyal to her and the handful of independent ships that saw

more hope in her path than Marco's that zones of protection were possible. Fleeing her new little zone of safety as quickly as she could was what she wanted down to her marrow, but it wasn't what she'd come here for. Wasn't what she'd risked her ship and her family and her life to get. And so a third of a g, and then the float, reorienting, then another burn. The farther she got from Fred Johnson's guns, the more she tried to make the *Connaught* hard for Marco to track.

When Oksana came to her cabin that night, it hadn't been as her officer but as her wife. She brought a bottle of whiskey with a bright-silver injection tip and two bulbs to drink it from. At first, Michio didn't want the company, but as soon as she did, she was desperate for it. Sex, in Michio's experience, was like music. Or language. It could express anything. Now it was rage and sorrow and need.

Afterward, strapped into the crash couch together, she listened to Oksana's breath, deep and steady as she imagined waves must be. Michio's heart felt fragile and more complicated than it had when she'd woken up that morning. Careful not to wake her wife, she stretched out, caught her hand terminal between her fingertips, and spooled up Marco's denunciation. The light from the little screen filled the room, and she dropped the sound until it was nothing but a distant rhythm of hard consonants. Heard that way, there was a pattern to how Marco spoke. A throbbing in his delivery like he was imitating a heartbeat. She'd never noticed that before.

She shifted over to the cached copies of the community feeds and forums. They filled with reactions and opinions. Judgment of her and her family. Declarations of hatred. Threats of death. Nothing she hadn't expected. These were the people she was risking everything to feed and support. And because she stood against Marco to do it, they hated her. Not all of them, but many. And deeply.

Good thing she wasn't doing it for the popularity.

The alert went on. Attitude adjustment and burn. She shifted the hand terminal to the *Connaught's* control systems. Nadia had plotted in a complex adjustment, turning on all three axes with a variable burn so that when they were done, only someone with very precise sensor arrays who'd caught them all the way through the maneuver would be able to plot where they were going with any certainty. The countdown came, the burn pressing her and Oksana gently against each other and shifting the crash couch

beneath them, swinging one direction and then another and back. The deep rumble of the Epstein was like God apologetically clearing His throat.

Oksana yawned, stretched, put her hand on Michio's shoulder.

"Hoy, Captain," she said, voice slushy with sleep and the aftermath of coupling. Michio sighed, smiled.

"Navigator Busch," she said, matching Oksana's joking formality, and weaving their fingers together. "You should sleep."

"So should you. Can you?"

"No," Michio said. "If it gets to be a problem, I'll hit the autodoc. Get something."

"What's the status?"

Michio almost asked, *The status of what?* But it would only have been so she didn't have to think too much. She knew Oksana meant the Free Navy's reaction. Were there gunships burning for them now? Had long-range torpedoes launched toward them from the ships and stations of the Belt, hoping to come quietly and fast enough to overwhelm their PDCs? Michio shifted to kiss her forehead just at the hairline. Oksana's hair smelled of musk and the fake vanilla she favored. It was a beautiful scent.

"Everyone hates us, but no one's shooting yet," she said.

"They will, though."

"They will. But we've carved little islands of safety. Now that they've accepted our tribute, we can go to Ceres or any other station Fred fucking Johnson takes without Marco following on. Unless he's ready for a full battle with the inners."

"In which case, it won't really matter if we're there or not," Oksana said, her lips against Michio's collarbone. "And you? Are you all right?"

The *Connaught* made a complex corkscrewing burn, the crash couch shifting one way, then another. The universe seeming to swirl around the stillpoint of their bodies. Michio shrugged in the darkness. "I don't know. I know what my project is. Get the things the Belt needs and give them to the people that need them the most. But ... no one's going to thank us for it."

"Some will," Oksana said. Then, a moment later, "I mean, no one with power."

"Isn't that what we're doing, though?"

"Doing?" Oksana asked, rubbing the sleep out of her eyes.

"If no one with power loves us, let's make our own damn power."

Chapter Twenty-Four: Prax

The morning routine was the same. Prax got up first, padded to the kitchen still wearing his robe and slippers. He started brewing the tea and making breakfast for the family. Pancakes and bacon for the girls. Red rice and eggs for him and Djuna. He played music on the system. Usually something calm and wandering, what Djuna called his getting-a-massage music. And about the time the rice was cooked and the bacon crisped, he heard the sound of Djuna's shower and the voices of Mei and Natalia. This particular morning, the girls were gabbling pleasantly to each other. Other mornings, they would snap and argue.

When Djuna's shower water stopped, he poured the first pancake onto the grill, two eggs beside it. They took almost exactly the same time to cook, so that he could turn them both, one with either hand. It was showing off, but when Mei saw it, it always made her laugh. Djuna's hectoring voice came from the hall, moving the girls through their morning rituals—washing faces, combing hair, getting dressed. When they all came to the table, Prax would be the only one not wearing his work clothes. The girls made fun of him for lazing around in his robe, even though he'd been the one to do the most, and he pretended to be offended even though he really wasn't.

After breakfast, Djuna would take the girls to school on her way to work, leaving him alone to clean away the dishes, take his own shower, and prepare for the lab. It wasn't something they'd ever discussed. It was just the way their own particular domestic habits had formed. Prax liked it like that. He'd had more than enough adventures in his life. He got more work done when things were predictable.

He sweetened his tea with the same syrup he drizzled over the pancakes, put the plates and glasses filled with food in their places, and was just sitting down with his rice and eggs when Djuna came in, driving the girls

before her like a cattleman in the tradition of mothers all through history.

Mei was a little quieter than usual, Natalia a little brighter, but both within the error bars. Djuna turned down the music while they ate and talked. When the conversation turned dangerous, Prax didn't notice.

"What does *resistance* mean?" Natalia asked. Her face was serious and sober, and on so small a person, vaguely comic.

"It's a measure of how electrons flow through something," Prax said. "You see, we think about current flowing through wires kind of the same way we think of water flowing through pipes. It's actually more complicated than that when you get down to quantum levels, but it's a very, very good model."

"And models are how we make sense of things," Natalia said. Proud of herself for remembering the catchphrase that he and Djuna had been using with the girls for so long. He didn't think Natalia was old enough to understand it yet, but she would be. And Mei sometimes surprised him with her insights.

"Yes," Prax said. "Exactly. So resistance is about how hard or easy it is for electrons to flow through something."

Natalia's little brow furrowed. Mei was looking away and Djuna had gone very still. Which was odd. But he could tell he wasn't making sense to the girls, so he tried again.

"So imagine you've got a big straw," he said, demonstrating with his hands. "And when you put it in your juice, it's really easy to drink. But then you take a teeny little skinny straw, you have to try really hard to get the same amount of juice up out of the glass. The big straw is like something without much resistance, and the little straw is like something with a lot of resistance."

Natalia nodded very seriously. It was like he could see her trying to solve the puzzle of it. "Is it a good thing or a bad thing?" she said.

Prax laughed. "It's not good and it's not bad. It's just part of how the universe is. Now, if you had a circuit where you wanted really low resistance and you didn't have it, that wouldn't be a very good circuit. But only because it didn't do what you wanted. If you had something where you wanted high resistance, maybe that very same circuit would be perfect. It's not about right and wrong. Just how things work."

"It's time to go," Djuna said, and her voice seemed sharp. It was the

voice she used when something was bothering her. And there were still almost fifteen minutes before they really needed to be out the door. Maybe something was going on at the biofilms lab he didn't know about.

When they'd left, he turned his music back on, cleared the dishes, showered, dressed himself for work. The rooms seemed wrong without them, and the extra time by himself empty and somehow ominous. All the way to the tube station, he worried about whether Mei had remembered to take her medicine. He'd planned to use the tube ride to review the new datasets on the harvester yeast, but his eyes kept skipping off his hand terminal and up to the screens across from him. A newsfeed was spooling, but he couldn't hear the words over the rattling of the tube and the voices of the other commuters. Ships were fighting, but he couldn't tell where. Earth. Iapetus. Pallas. Ceres. Mars. In the void between places, far distant from everything. They were all possible. The only thing he could be certain of was it wasn't here, and that only because there weren't any alerts blaring.

At the central station, half the passengers shuffled off into the vaulted transfer chamber, making way for another flood coming on. A half dozen men in Free Navy uniforms were among them. The Free Navy had started wearing sidearms openly now, and they walked with a swagger. Two civilian girls seemed to be with them, laughing and flirting. The oldest of them didn't look much past her twenties. Not *that* much older than Mei. Not really. Prax turned his attention back to the newsfeed, and then his hand terminal. He still wasn't able to concentrate on it, but something about the Free Navy men made him feel more comfortable with his eyes cast down. His heart was pumping a little faster, his back felt tight. He hadn't done anything wrong, but the sense of being threatened and the experience of guilt were so closely related that it was hard to feel one without the other.

When he'd been a student at lower university, he'd had to take a humanities class—literature, drama, art appreciation. Something to make him well rounded. He'd opted for philosophy in hopes that it would have something like rigor to it. Most of the experience had been forgotten, the memories washed away in decades of neuroplastic adjustments. What he did still recall was dreamlike and fragmentary. But sitting there, pressing deeper into the seat as the tube car shifted up toward the surface, the hum and rattle of the tube vibrating up his spine, listening to the too-loud laughter of the soldiers, one moment came back to him vividly. His

professor—an overweight, balding man with an alcoholic’s complexion and an air of intelligence so profound it seemed to bend space around him—lifting a hand and speaking a phrase: *the terror of the normal*. Prax was almost sure it had been something about Heidegger, but here and now, he thought he understood it better than he had back then.

This was how things were now. This had become normal.

He’d hoped to spend the morning on his own research, but Khana and Brice didn’t even let him get as far as his lab before falling into step beside him.

“I was looking at the open partition, and I think there may have been a problem with the data transfer,” Khana said. “The datasets directory only had Hy18 through the ninth run.”

“No, no,” Prax said. “I know. I didn’t get around to transferring them yet. I was going to, but I got distracted.”

Brice made a small sound in the back of her throat. Prax understood it, and he didn’t envy her. Ever since Karvonides’ death, Brice had been in the unenviable position of doing her own work and covering for her dead supervisor. Every day, Prax had intended to move all the critical data out to the open partition. He couldn’t even say why he hadn’t gotten around to it. It was just that something always seemed to come up.

“Boss,” Khana said, “we need the latest on Hy1810 unless you want us to push the new run.”

“You can’t push the new run,” Prax said.

They reached the door of Prax’s lab. Khana shoved his hands into his pockets, his jaw set, his eyes focused off somewhere about ten centimeters to Prax’s left. “I know. But ...”

“I’ll do it now,” Prax said. “Give me half an hour.”

He ducked into his lab and pulled the door closed behind him. Khana and Brice hovered for a long moment on the far side of the frosted glass and then walked away. Prax sat at his desk. He wanted to check the water levels and pull new samples from the hydroponics. He was tempted to just do that for a few minutes, put off going through Karvonides’ partition. But he’d said now, and they really did need to get the animal trials going.

He pulled up the staff directory, keyed in his access code, and let the system do its ritual biometric check. Then, with a deep sigh and a sense of growing dread, he went into the dead woman’s partition. It was his job to do

this. There was nothing to be anxious about.

Two of the datasets were in editing lock, so he had to close them down before he could move them. Not hard, but it took a few more seconds. He would need to go through her messages too. Make sure anything that needed attention was passed down to Brice or up to McConnell. Anything personal for her, he could ignore. He didn't need to pry, and he probably didn't want to know. Except that one of the messages had James Holden in the subject. NEW JAMES HOLDEN FEED FROM CERES, it said. James Holden, who'd saved Mei. And Prax himself. And everyone. Prax didn't intend to open the feed. It was more like a reflex. *This looks interesting—what is it?*

On the feed, just as promised, James Holden looking earnestly into the camera. On the one hand, it looked professionally produced. The video didn't stutter or shake. The colors had the carefully modulated look of a newsfeed. Holden's voice when he spoke was clear and sharp without being spiky. But Holden's demeanor had an awkward authenticity that was so familiar and unrehearsed, it was like seeing him in the flesh again.

"This is James Holden from Ceres Station. Today, we're doing the third in this open ended series thing, and I'm really hoping you're all looking forward to this. Especially all my friends and family back on Earth and Mars. I say this every time, but we're doing these clips and interviews so that the folks back home can put faces and voices to the real people out in the Belt. And ... yeah. So, let me introduce—"

The image cut to a tall Belter girl sitting in the galley of the *Rocinante*. Prax leaned forward. He'd sat exactly where she was once, during the worst part of his life. He felt a wave of nostalgia like seeing his apartment from upper university—someplace familiar that had been important to him once—that broke against the novelty of this new girl.

"Alis Caspár."

"Great. Okay, and where do you live?"

"Ceres Station. Salutorg District."

Prax watched the whole feed. The clap-juggling of shin-sin that seemed to delight and fascinate the Earther. The way the girl was embarrassed for him and he didn't seem to notice. The older woman they called Tía flirting with him. It was ... charming. With all the news of war and death, with all the images of ships chewing each other to shavings of metal and ceramic,

the body bags of Earth, Holden's video was nothing. Pleasant. Meaningless. Sweet, even.

The feed ended. Prax, surprised, found he'd been tearing up. He wiped his cheek with the cuff of one sleeve, and was startled when the next message opened its own feed automatically. A thin-faced woman with skin darker than Djuna's but with the same deep hazel eyes smiled into the camera. The image shook a little and the colors weren't as professionally toned as Holden's had been.

"This is Fatima Crehan, sending back to James Holden and all the good people of the Belt. We're in the refugee camp opened by the governor of Arequipa, and today I want to introduce you to a woman whose causa has been turning heads and filling bellies for, it seems like, everyone in the city."

Prax watched, fascinated. And when it was over, another video feed, this one from Shanghai, where an old man in a yarmulke interviewed a musical band of ethnic Han boys about their music and then watched them in an alleyway with mud-colored clouds churning above them. Prax couldn't look away.

A soft knock came at the door. Brice leaned in. "I'm sorry to interrupt, sir, but—"

"No no no, it's fine. I'm transferring them now." Prax grabbed Karvonides' data reports—none of them edit-locked now—and shifted them into the open partition. "You should be able to access all of them now."

"Thank you, sir," Brice said. And then, "Are you all right?"

"I'm fine," Prax said, wiping his eyes again. "Carry on."

She closed the door. Two hours had gotten away from him somehow, and he was going to have to hurry in order to get all the samples pulled before lunch.

We could save lives. One message.

Prax shut down the dead woman's partition, put it under administrative lock. There wasn't time to think about anything more. He had work to do. In order to catch up, he ran the samples during his lunch hour, grabbing a few mouthfuls of rice and mushroom before the management team meeting. Afterward, it was time to go and retrieve Mei and Natalia from school, but he sent a message to one of the other parents in his parenting coop. The

girls could go play with the other kids until Djuna got home. He stayed, checking in with Brice and Khana. Seeing that everyone who needed access to the datasets could get to them.

Everything felt weirdly dreamlike and light. As if he was watching someone else doing it. In his office, he rechecked the day's sample run. How much dissolved CO₂ in the water, how much nitrogen, calcium, manganese. The plants were doing well, but until the stats were all fed through, he wouldn't know what he was looking at. That was fine.

He resisted the urge to reopen Karvonides' partition. To find the other feeds Holden had made or inspired. It was a bad idea. Instead, he waited, worked, watched through the glass. Only Brice remained, and her workstation was down a long and curving hallway. He closed his terminal, clocked out, went to the men's room, and waited. Washed his hands. Waited. Then casually stepped out to the main floor, swinging by one of the gang stations, opening a terminal with a guest account, accessing the datasets and protocols that Supervisor Praxidike Meng had carelessly put in the open partition without permissions set. The screen showed a pale blue logo, the flag of Ganymede. He sent copies to Samuel Jabari and Ingrid Dineyahze on Earth and Gorman Le on Luna. The only message was PLEASE CONFIRM THESE RESULTS.

Then he shut down the terminal and made his way out to the common corridors. Everything seemed brighter than it should have been. He couldn't tell if he was tired or restless. Or both.

He stopped at a noodle stand between the tube station and home. No-Roof for him and Djuna. Fried tofu for the girls. And—a luxury—rice wine. And a round ceramic container with green tea ice cream for dessert. When he got home, Natalia was whining about having to drill her times tables and Mei had shut herself in her room to trade messages with her friends from school and watch entertainment feeds of boys three or four years older than her. Other nights, he would have insisted that they all come to the table for dinner, but he didn't want to disturb anything.

He served the noodles into recyclable ceramic bowls with a pattern of sparrows and twigs on them, brought one to Natalia at her desk, another to Mei sprawled out on her bed. She was so big these days. Soon, she'd be bigger than his shoulder. His little girl, who no one had expected to live,

and look at her now. When he kissed the crown of her head, she looked up at him quizzically. He nodded her toward her screen of soulful-looking young men.

He and Djuna sat at the table together, almost like they were dating again. He looked at her: the curve of her cheek, the little scar on her left knuckle, the gentle fold of her collarbone. Like he was saving it for some coming day when she wouldn't be there. Or else when he wouldn't.

The rice wine bit at his mouth. Maybe it always felt like that—chill and warming at the same time—and he just didn't usually notice. Djuna told him about her day, the office politics and palace intrigues of biofilms, and he took in her words like they were music. Just before he cleared their dishes and broke out the ice cream, she reached across the table and took his hand.

“Are you all right?” she said. “You’re acting strange.”

“I’m fine,” he said.

“Bad day at work?”

“No, I don’t think so,” he said. “I think maybe it was very good.”

Chapter Twenty-Five: Fred

James Holden has just declared piracy legal,” Avasarala said from Luna, then paused. Her eyebrows were high on her forehead, and she nodded a little. Like she was encouraging a not very bright child to understand her. “He took in a *pirated* ship. From a *pirate*. And then thanked her for his cut of the fucking booty and waved as she burned away. And you, the Butcher of Anderson Station, grand Whatever-the-Fuck of the OPA? You sat there with your cock in your hand and let him do it. I mean, I understand Holden is Holden, but I let you put your hands on Ceres because I thought you at least were a fucking grown-up.”

She leaned back from her camera, shaking her head, and cracked a pistachio.

“I thought better of you, Johnson,” she said. “I really did. My life has become a single, ongoing revelation that I haven’t been cynical enough.”

At this point, he was pretty clear she was talking for the comfort of hearing her own voice. He checked the feed data. Ten more minutes. She might get to something important in the course of it, so he let it play as he walked through the bedroom. Her sharp consonants and scratching vowels made a kind of background music while he dug his evening medications out of his bedside table. Five pills and a glass of water. The pills were chalky and bitter on his tongue, and even after they were washed down his throat, he suffered their aftertaste.

Working twenty-hour days was a younger man’s gig. He could still rise to the occasion, but there had been a time his determination against the universe would have felt like a fair fight. Anger alone would have carried him forward, and maybe the scourge of fatigue would have made him feel he was expiating his sins. Now he was surviving on coffee and blood pressure meds and trying to keep the system from falling any further apart. It seemed less romantic.

“It looks like Richards has almost whipped what’s left of the Martian parliament into order,” Avasarala said, “so hopefully we can get something from her. Just an assurance she won’t come piss all over our strategy so it smells more like her would be enough. Souther’s pushing for Rhea or Pallas, depending on whether we want to shore up the allies we already have, half-assed as they may be, or deny Inaros a manufacturing base. Admiral Stacey’s pushing back against any of it for fear of stretching our ships out too thin.”

Both strategies were mistakes. He’d need to make the case for that. She pressed her fingers to her forehead. A short, percussive sigh. For a moment, she seemed smaller. Vulnerable. It was a strange look for her.

“We’ve had two more rocks. One of them had the stealth coating on it, but we caught it. This time. I’ve got the deep arrays sifting through all their data looking for more. But it costs so little to push something into an intersecting orbit, Inaros could have done hundreds of these. Spaced them out over months. Years. A century from now, we could see something loop in from out of the ecliptic with a note on it that says, ‘Fuck you very much from the Free Navy.’ My grandchildren’s grandchildren will be cleaning this same shit up.”

“Hopefully. If we win,” Fred said to the screen. Not that the recording could hear him. He moved to the bathroom, and the display shifted to follow him.

The best thing about the governor’s quarters was the shower. Wide as a rainstorm, and the whole floor a grated drain that worked even at a third of a g. Fred stripped and washed the sweat and grime of the day off his skin while Avasarala went over the latest intelligence about the state of affairs on the colony planets (no hard data, but things were probably bad), the reports on the ships that had gone missing passing through the gates (several theories and hope that the flight records from Medina would help if they ever became available), and the situation on Earth (the expected second wave of deaths from collapsed food, sanitation, and medical infrastructure was starting to appear).

After he dried off, Fred pulled on a fresh shirt, clean trousers. Thick, soft socks. The small pleasures of life. Avasarala kept delivering her report, diving into unneeded details and side comments as if she were lonely and didn’t want to face the emptiness and quiet of her own rooms on Luna. But

even she couldn't last forever.

"I'll expect to hear from you," she said. "And I'm fucking serious about this. Don't let Holden. Make. Any. More. Laws."

Fred sat on the edge of the bed, closed his eyes, and let his head sink into his hands. He'd been awake for over thirty hours now, and was looking down the barrel of another shift. Negotiating with the unions, adjusting decades-old contracts to fit the new situation. Moving Belters out of their holes, shutting down great swaths of the station to conserve the supplies they had. Part of his mind kept treating it like an emergency. A wound that had to be stanchied until help could arrive. Three, four times a shift, he'd remember that there wasn't help. That the choices he made today might stay in place for years. Forever.

The temptation to lie back, put his head to the pillow, and let his gritty, tired eyes close was as powerful as hunger and sex had been four decades back. The weight of the idea as much as exhaustion pulled him down. It was stupid for anyone, much less a man his age, to be pushing that hard, and the governor's bed was soft and inviting, the sheets clean and crisp. But if he did, his eyes would open the moment his head touched the pillow. Restlessness would twist him, knotting the sheets around his legs until he gave up, two or three wasted hours later. One more shift, and he'd be spent enough to let the pills work. He'd fall into the blackness behind his eyes, consciousness blinking blissfully out. But not yet.

His first lover—Diane Redstone, her name was—had a phrase for moments like this. *Nice woods*, she'd say, and then get up out of their bed and go to work. He hadn't understood where the saying came from until years after they parted for the last time. Now that he did, he couldn't help harboring an irrational dislike of Robert Frost.

He pulled up his hand terminal, considered himself through its tiny eyes, and pressed Record.

"Message received. I'll do what I can to keep our mutual acquaintance in line. But I'd also point out that he's a resource we'd be foolish to squander. Neither of us is in a position to do some things that Holden and his people can. Speaking of which, I'm including a salvage manifest for the *Minsky*. It's a big ship, and well supplied. It's within my power as acting governor of Ceres to claim emergency powers and seize property for the common good. That's not Holden's law, that's just law. I'll be sending it and

a third of its cargo back down to Earth, and the *August Marchant* and *Bethany Thomas* as escort. There's enough in there to keep a midsized city alive. Just a drop in the bucket, I know, but that's how buckets get filled."

He tried to think of anything else he should say, and couldn't decide if there was too much or not enough. Either way, it could wait. He reviewed the message, encrypted and queued it, and then levered himself up off the bed. There'd be time to sleep later.

His security detail met him outside his door and followed him to the carts in the main corridor. His was sheathed in bulletproof glass. Sitting in it made him feel like he'd put his head in a fishbowl. But until he was certain that Inaros didn't have more people mixed in among the millions of legitimate citizens, he was stuck with it. And since he'd never be certain, he figured he might as well get used to it. They lurched out into the corridor—one security cart going before him and another behind, leaving enough room that a bomb would have a hard time taking out all three at once. The logic of the battlefield. And everything was a battlefield now.

The citizens of Ceres made way for them, standing against the corridor walls and staring as they passed. Fred felt like he should genuflect to them. Or wave. Anderson Dawes—his old friend and enemy—had run this station for years. He couldn't imagine the man putting up with this. But Ceres had been a different place then.

The governor's palace was close to the docks, out near the skin of the station where the spin gravity was greatest and the Coriolis least. The *Rocinante* had its own berth in the same dock as the *Minsky*, and when Fred's cart pulled to a stop by the loading dock, James Holden was already there.

"I was wondering if you were going to come over," Holden said as Fred pulled himself out of the cart. "Because I couldn't help noticing that someone shot at us."

"Really? And here, I thought they shot at the pirates."

Holden closed his mouth, his face turning a little darker. But then he shrugged. "Okay, that's a fair point, but it was still a dick move."

"It wasn't my people," Fred said, moving toward the *Rocinante's* airlock. Holden took the hint and fell in step beside him.

"I guessed that from the way that not every other ship in the fleet followed suit. And thank you for that, by the way."

“You’re welcome,” Fred said as they passed into the ship’s cargo hold. Amos Burton—wide-shouldered and friendly—stopped the mech he was driving and let them pass through with a nod. Fred had never met the infamous Clarissa Mao in person, but the girl who ducked away from the lift and into the machine shop was unmistakable. Wasn’t the strangest alliance he’d seen, but it was close. Fred waited until Holden was on the lift too and then set the controls for the crew deck. When they were out of earshot, Fred continued. “There’s something I need to discuss with you.”

“Is it about how someone shot at us, because I’m still kind of stuck on that.”

“I’ve got a team on it. We know it was Free Navy sympathizers, and we know which supply dump they raided to get the munitions, and no, that’s not why I came.”

“Are you going to arrest me for aiding a pirate?”

Fred chuckled. “It had crossed my mind, but no.”

“Bobbie? Because I’m not sure this whole ambassador thing is working out for her.”

“Not that either. You know I’ve been working on a summit. High-level meeting with the branches of the OPA that haven’t declared for the Free Navy.”

“The pajama party.”

Fred winced. “I wish you wouldn’t call it that.”

“Sorry. I just like the visual. Your very serious meeting of OPA leaders.”

The lift stopped at the crew deck. Fred got off, turning toward Holden’s cabin. Their footsteps on the decking sounded louder than Fred remembered, but it was probably just that the full crew wasn’t there any longer to provide the background noises of human life. No conversations, no music, no laughter. Or maybe it was only that it seemed that way to Fred.

“They won’t come to Ceres.” Fred sighed. “Not with the fleet here.”

“I can’t recommend sending the fleet away, though.”

“No, that would be bad. We’ve agreed on Tycho Station, but only with the provision that no UN or MCRN ships come.”

Holden paused at his cabin door. His brow was furrowed. It made him look younger than he was. “We’re going to my cabin because I have that whiskey you like, aren’t we?”

“We are,” Fred said. Holden considered for a moment, shrugged, and led the way in. The captain’s cabin was larger than the others on the corvette, but felt smaller by having many of Naomi Nagata’s possessions in the space too. Holden opened a locker and pulled a flask and two bulbs out, filling them as he spoke.

“What are the chances of pulling together a meeting like this and not having Marco find out about it?”

“Poor,” Fred said, taking the bulb Holden held out to him. “But that’s going to be true no matter what we try to organize. The OPA’s not an intelligence service. Everything out here runs on gossip and personal relationships.”

“Unlike intelligence services?” Holden said, and Fred laughed.

“All right, it’s a little like an intelligence service. My point is, yes, the information will leak, if not in detail, at least in broad strokes. Trying to keep it secret would be an exercise in frustration. And counterproductive, really. If we’re tiptoeing around the Free Navy, it makes it seem like we’re afraid of them. It strengthens my hand if these people see me coming in unafraid. Not foolhardy, but not intimidated.”

“Like on a gunship,” Holden said. “But not one that works for Earth or Mars. Maybe an independent that’s done some work with the OPA on and off. One that Marco has already tried to blow up a couple times and failed.”

The whiskey really was very good. Rich and complex, with the aromatics of an oak cask and a pleasant bite. He handed the bulb back over to Holden and shook his head when the captain offered him a second shot. Holden emptied his own bulb, thought for a moment, refilled it, and emptied it again.

“You know,” Holden said, putting bulbs and bottle back in his locker, “Inaros is going to disrupt this meeting.”

“That’s why I’m not sending you messages through the comm system. I don’t know how much has been compromised, and I’m a strong believer in the security of the air gap. But the truth is, as much as we’ll keep the details away from him, I’m hoping he’ll try. There’s nothing like attacking in anger to leave you exposed. And if he turns toward us, it gives Pa some breathing room.”

“I thought you were against joining forces with her.”

“I am. It was a bad move, and I expect we’ll pay for it. But since we’ve

done it, we should do the hell out of it. Better to be decisive and wrong than to let them see us wobble.”

Holden leaned against the wall, his arms crossed. Scowling. Fred waited.

“How does this end?” Holden said.

“We keep trying to draw him into making a mistake. He keeps doing the same to us. Whoever screws up last loses. Whoever screws up second to last wins. That’s what war is.”

“Not sure I was asking about the war,” Holden said.

“No? What then?”

“You always said you were looking for a place at the table. How do we win the peace? How does *that* end?”

Fred was quiet for a long time, a sense of mourning blooming in his chest, thick and aching. “Honestly, then? I don’t know how it ends. I don’t even know if it ends. I dedicated my life to this fight. First one side, and then the other. But now, I look at it? What’s happened with the gates. What’s happened to Earth. I don’t recognize this anymore. I keep doing what I can because I don’t know what else to do.”

Holden took a deep breath and let it out through his teeth. “When should we be ready to go?”

“I told Drummer I’d be wrapping things up here for two weeks. I’d like to leave four days from now. While any of Marco’s people who find out about it are still putting together their plans. Make them move before they’re ready.”

“All right,” Holden said. “We’ll take you.”

“I’ll have my people report whenever you need them. I’ll see myself out,” Fred said with a nod, and headed for the lift.

On the way back down, he closed his eyes and let the thin vibration of the mechanism rattle up through the soles of his feet, up his aching spine, to the crown of his head. There was still so much that needed doing before he left Ceres. He still had to meet with the crew of the *Minsky*, but he’d promised to consult with Avasarala’s solicitor general before he did, so that he didn’t accidentally obligate Earth to anything by saying the wrong phrase. And he wanted patrol rotations set for at least a month, so that his unexpected absence wouldn’t throw anything off. And he wanted sleep.

As he stepped out the airlock again, his hand terminal chirped. A new

message had arrived from Earth. From Avasarala. He paused in the wide air of the docks. The roar of the air recyclers and the clang of the loading mechs. The smell of lubricant and dust. His security detail was already moving toward him, ready to usher him back into his fishbowl. He waved them back and started the message.

Avasarala was in a corridor, shuffling briskly in the lunar microgravity. She looked as tired as he did, but she had a thin, amused smile. He'd never known anyone in his life who could be so cheerfully disappointed in humanity.

"I've run your list past my relief coordinator," she said—what would it be? Eight minutes ago? Ten? He used to be able to calculate light delay in his head. "It didn't quite bring him to orgasm, but I think he may want to take you out for drinks when you're in town. Be careful with him. He's got busy hands."

Someone off screen interrupted. Avasarala's eyes flickered away from the camera and she shook her head. "Does he want me to wipe his ass for him too? His job is to make decisions, not ask me what decisions he ought to make." A curt, deferential voice said yes, *ma'am* or something like it, and she started walking again.

Fred found himself smiling. When she'd been his enemy, she'd been a good one. Now that they were working as allies, the ways that they were the same almost humanized her.

"Where was I? Oh. Yes, the so-called relief supplies. I'm sending along a list of what we most need on the surface. If you get a chance to pass it on to Pa, please do. Apparently we're *all* fucking pirates now."

Chapter Twenty-Six: Filip

The night before the *Pella* left Pallas Station, Rosenfeld hosted a dinner for Marco and the other captains. The hall had been a vast open space designed as a construction compartment, but changed now into a kind of null-g throne room. A soft, chiming music played like flowing water with a melody. Serving platforms bristled with ceramic bulbs brightly colored as oil on water and filled with wine and water. Long ribbons of red and gold shifted in the breeze of the recyclers. Great lengths of gold fibered paper fluttered and bellied against the walls between the hand- and footholds. The crew of the *Pella* and the staff of Rosenfeld's Pallas authority mixed, Free Navy uniforms standing out sharp and martial against the casual civilian clothes of the locals. Young men and women in flowing robes of crimson and blue floated through the air slowly enough to deliver tapas of bean-and-grain cake, curried shrimp fresh from the tanks, and garlic sausage with real meat stuffed in the skins.

No element of the design suggested a consensus up or down. No concession had been made to the architecture of Earth and Mars. The combination of a traditional Belter aesthetic with lushness and luxury left Filip a little intoxicated even before he started drinking.

"I don't know what you could mean by purification," his father said through laughter, "if not 'getting rid of the impure parts.'"

Rosenfeld's answering chuckle was dry. After weeks traveling with the man, Filip still wasn't certain he could read his expressions. "You're saying you planned for this?"

"Anticipated. A change in the system of the greater world always risks having people lose perspective. Get drunk on possibility. Pa rode the wave in; now she thinks she can command the tides. I didn't know she would break, but I was ready if she did."

Rosenfeld nodded. Across the great echoing chamber, two women sang

together a few bars of a song that Filip knew, and then dissolved into hilarity. He looked across the open air, hoping that one of them might be looking back. That a girl would be watching him floating in conference with the great minds of the Free Navy. No one was.

When his father went on, his voice was lower. Still conversational, still friendly, but charged. "I had plans in place for anyone that broke. Pa, Sanjrani, Dawes. You. When I make my next strike, everyone will see how weak she is. Her support will burn off faster than breathing."

"You're sure," Rosenfeld said, making the words a statement and a question at the same time. He drank from his bulb, coughed. Filip watched his father waiting for the pebble-skinned man to finish his thought. Rosenfeld sighed, nodded. Filip felt some deeper meaning swim just below his understanding, leaving him bobbing in its wake. "It's only that she's been feeding people. The laity find that sort of thing endearing, sí no?"

"Anyone can buy votes with free ganga," Filip said.

Rosenfeld turned his head then, like he was noticing Filip for the first time. "True, true."

"Johnson and his cobbled-up fleet," Marco said, "have been squatting on Ceres with their eyes wide. Can't move forward without exposing themselves. Can't move back and leave Ceres to us again. They're trapped. Just the way we said they'd be."

"True," Rosenfeld said, and left *True, but ...* hanging in the air. All the criticisms trailed behind it like the ribbons in the breeze. *True, but it's been a long time since we left Ceres, and it's left us looking weak ... True, but one of your generals broke away and you haven't brought her to heel ... True, but Fred Johnson is issuing orders from the governor's mansion at Ceres, and you aren't.* Filip felt every point like a blow to the gut, but because they were unspoken, he couldn't answer them. Neither could his father. Rosenfeld took another drink, accepted a stick of vat-grown meat from a passing server, and steadied his drift with one hand as he ate. His expression was mild, but his gaze stayed locked on Marco.

"Waiting until the perfect moment is the mark of a great strategist," Marco said. "For now, the outer planets are ours to pass through freely. Mars and Earth and Luna—even Ceres. They're hiding behind their walls while we move through the wide plains of the vacuum, masters of the void. The more they realize they don't matter, the more desperate they'll become."

All we have to do is watch for the opportunity that's coming."

"Fred Johnson," Rosenfeld said. "He's already reached out to Carlos Walker and Liang Goodfortune. Aimee Ostman."

"Let them talk with him," Marco said, an edge coming into his voice for the first time. "Let them see how little he's become. I know his patterns, and I know what you're saying."

"Not saying anything, coyo," Rosenfeld said. "Except maybe we've been drinking too much."

"I told you before that Johnson would be off the board, and he will be. We didn't take him at Tycho, and we'll take him somewhere else. He is my white whale, and I will hunt him to the end of time."

Rosenfeld looked down at his bulb, his body hunching a degree in submission. Filip had felt his father's victory like it was his own.

"Didn't finish reading that book, did you?" Rosenfeld asked mildly.

Marco called the ships the three wolves. The *Pella*, of course, was the leader of the pack, with the *Koto* and the *Shinsakuto* placed in slow orbit to support her. Moving the ships into position was the hard part. Marco's trade hadn't included true stealth ships. The nearest they had were regular gunships with a coating of the stolen radar-eating paint layered over the skin, and without being designed for it and for holding waste heat, the Martian tech was less effective.

But the Belt had always had smugglers, pirates, and thieves. There were ways to hide, even in the abyss. Running without transponders was only one of them. They'd left Pallas with a hard burn. Hours of being pressed into the crash couches, juice burning in their veins and still driven to the edge of consciousness. And then, the coast. With no drive plume to show where they were, the *Pella* and her fellow hunters were hardly more than warm rocks, making a traverse of the vastness between Ceres on the inner Belt and Tycho Station in its own deeper orbit. The *Koto* risked a braking burn to plant itself alongside a charted asteroid, using the mass of stone and ice to hide it and explain the ladar ping responses. The *Pella* and the *Shinsakuto* stayed on the float, their orbits matching the widespread detritus

of the asteroid belt. No broadcasts. The only communications were tightbeam. They off-gassed a little to cool the outer hull and complicate its thermal signature. The emptiness itself was their friend. Even in the most crowded corners of the Belt, where the asteroids were thickest, it would have taken a telescope to see the nearest neighbors. The *Pella* was a warm sliver of metal and ceramic in trillions of square kilometers—less than a thumbnail clipping in an ocean.

Even if Ceres saw them—and over the long weeks of their silent hunt, it might—they would be indistinguishable from a thousand other unlicensed prospectors, smuggling ships, and homesteading Belter families. Johnson and his inner planet allies would need to know where to look to find them. And even if they found one, two more waited.

Fred Johnson's desperate meeting to sweep up the shards of the OPA was still weeks away, but Marco put them in and flying dark long before Fred would need to leave the safety of Ceres. *Men have patterns*, he said. And Fred Johnson's were misdirection followed by overwhelming force. Their sources said that the fleet would remain pinned at Ceres. With overwhelming force no longer an option, all that remained was misdirection. And so they floated, their passive sensor arrays pointed at Ceres and Tycho like a too-clever child watching a street magician's other hand. When Fred Johnson went to make his plea to the ragged stragglers of the OPA still willing to listen, Marco said, he would know. And when Johnson's prospective allies saw him die ...

Well, they had lost Michio Pa. But Marco could replace her a hundred times over. Strength pulled people as surely as gravity. More, sometimes.

Marco would wait for hours every day, strapped into his crash couch as if a hard burn could come at any second, his eyes flickering over sensor data, and still end his shifts energized and laughing, excited. Joyful. Filip didn't have his father's raw endurance. For the first several days, he could equal Marco's focus and sense of imminent violence, and even then by the time he went to the gym, to the galley, to his cabin, the brightness in his chest had started to change to something more like anxiety. Or rage. Only he didn't know what he was anxious about or who he was so angry with.

When the *Minsky* came to Ceres, the *Connaught* at its side, Filip had been sure that the moment had arrived. Pa was there, the consolidated fleet watching her inch toward them like a cat hauling a dead mouse home as a

love gift. Filip felt it in his blood—the coming violence. The grand and gaudy proof that the Free Navy was stronger than its enemies. He hadn't been the only one either. It was like all the crew of the *Pella*—Josie and Karal and Bastien and Jún—everyone had taken a breath at the same time, steeled themselves for the burn and the battle.

Everyone but Marco.

He'd stayed just the same, watching the datafeeds from his crash couch on the command deck. The attack from Ceres, the *Rocinante's* defense of the *Connaught*. All of it seemed to wash over Marco like it was nothing. He captured images of the ship transfer. When he recorded his denouncement of Pa and revealed her as a stooge of the inners, he seemed to wake up for a moment, but only while the recording was going on. As soon as the camera shut off, he seemed to fall back into himself. Filip took comfort that this wasn't the same torpor and indifference that had haunted the *Pella* after leaving Ceres the first time. Marco watched like a predator in cover, the *Pella* drifting in its orbit around the distant sun like it was locked to Ceres Station.

Several days after the *Connaught's* departure, Filip dreamed of Earth—only it wasn't Earth. It was a massive spaceship, layer upon layer of scaffold, reaching down forever. A great fire burned at its core, and Filip was lost in it, trying to find something. Something precious that he'd had and lost or else that had been hidden from him. Also, he was being chased. Sought by something so that he switched from being hunter to prey and back to hunter.

In the dream, he was floating down a long corridor. Purely ballistic. The handholds and footholds skated by on all sides, just beyond his reach. There was a strong smell—mineral and heat. The exposed iron core of the Earth. Its burning heart. And there was something at the end of the passage. Something waiting. His mother and an army of the dead who he'd killed. The rapping of their bone fingers on the deck was a threat and a promise. Filip woke with a shout, grabbing at the straps of his crash couch like they were trying to strangle him.

Then the rapping of fingers came again, and the door of his cabin slipped open. Karal floated in the corridor, his eyes an image of concern. And maybe excitement.

“Hoy, Filipito,” he said. “Bist bien?”

“Fine,” Filip said. What time was it? He felt like he’d woken in the middle of a cycle, but he couldn’t be sure. He’d been sleeping so much lately, it was easy for him to lose track. So long as there was nothing to do but wait, it hardly mattered how the hours passed. But sleeping too long was much like sleeping too little. It left him confused and tired.

“Marco wants you. Command deck, yeah?”

Filip nodded with his left hand while he unstrapped with his right. “Con que?” he said. “Something happened?”

Karal’s look of concern eroded into a bestial grin. “Dui,” he said. “But let Marco show you, yeah?”

Pulling himself along the lift tube, Filip’s heart tapped against his chest. The sense of the dream wasn’t quite gone, bleeding into the solid ship under his hands. Excitement and dread wore each other’s clothes, spoke in the same voice. When he reached the command deck, the lighting was set for battle, and the crash couches were crewed: Sárta strapping herself down, Wings already in place. Bastien’s voice echoed from the cockpit, and the anticipation of thrust made Filip think it was above them. The words were clipped and terse. The air seemed cleaner, as if Filip could see everything for the first time.

Marco reached out and spun his own couch on its gimbals to face him. The light from the screen threw shadows across his father’s eyes. Filip saluted, and Marco spread his hands.

“The hour has now arrived, Filip,” Marco said. “All of our patience and sacrifice have brought us here to this one, perfect moment.” Times like this, he sounded almost like an Earther. Filip nodded, his heart beating faster. He didn’t know whether to keep looking at Marco or if it would be all right to turn to the screens. Marco laughed, and pulled Filip close. He gestured to the tactical readout. A dot of light.

If he looked outside the ship, on float with merely human eyes or through the cameras that took in the same spectrum, the star field would have overwhelmed the glimmer from the ship. Even Ceres would have been little more than a bit of darkness where the starlight was blotted out. On the screen, the critical light was brighter, its path sketched in. Filip glanced at Marco for permission, received it in a nod, and then drew back the scale until the full arc of the little ship’s pathway was clear.

A single ship, burning hard from Ceres to Tycho.

“Fred Johnson,” Filip said.

“More than that,” Marco said, and the calm in his voice made him sound almost drugged by pleasure. “Look at the drive signature.”

Filip did, blinked. His breath went shallow and tight. It matched the *Rocinante*. James Holden’s ship. His betrayer of a mother. The clean, clear center of everything he hated, everything they had to overcome. And here it was, delivered to them like a present.

“I’ve been tracking them. They’ve left the effective protection range of Ceres. They’re alone in the void, except for us.” Marco’s smile was beatific, but the expression in his dark eyes changed. Instead of being lost in the gratification of the moment, he was looking at Filip. More than looking at him. Seeing him. Seeing *into* him.

“KaraL,” Marco said. Half strapped into his couch, the big man paused. Marco shifted a degree. “Need you in engineering. Damage control, yeah?”

KaraL shrugged, unstrapped. Marco looked back at Filip, then pointed to the crash couch with his chin. *It’s your station. Take it.* As KaraL launched down the lift tube, feet vanishing last, Filip pulled himself into the crash couch. Weapons controls filled the screen. Torpedoes. PDCs. The sword of the *Pella* was in his hands.

The warning Klaxon seemed to come from a great distance. The *Pella*, preparing after weeks sleeping on the float. The needle stung when it went into his vein, and the cold, bright flow of military-grade juice lit him from within like he was fire itself, consuming everything he touched.

Two new dots appeared on tactical. New stars in the star-sown blackness, both marked as friendlies. The *Koto* and the *Shinsakuto* leaping from their cover, and announcing their attack. The *Pella* jumped up around Filip, grabbing his crash couch and all the others on the command deck. The gimbals hissed in unison as Bastien brought them around, couches snapping to face the new up and follow it, whichever way the maneuvering thrusters demanded. The rumble of the drive passed through the ship, through Filip’s bones. The crash couch gel flowed up the sides of his body. As if he was watching someone else do it, he keyed in firing solutions. One gunship against three. The *Rocinante* couldn’t help but die.

“They saw us, them!” Bastien shouted. “We’re getting painted!”

“Filip,” Marco said.

“Sa sa,” Filip said. With a motion, he trained the PDCs toward the

distant flicker that was the enemy, ready to chew down any incoming torpedoes. The *Pella* jumped forward again, the hard burn jumping harder. Filip let his arms sink down to his sides, fingers on the built-in controls. He fought to inhale. Five gs. Six, and the acceleration was still going up. The wolves were loose now. The pack running.

His vision narrowed, shadows crowding his peripherals like the dead from his dream. He had the weird sensation that *she* was in the room. Naomi Nagata. But that was only an accident of sleep and high-g blood flow. The crash couch chimed, a fresh infusion of juice brightening him. His lips were growing numb and tingling. He couldn't lift his head from the couch any longer. It was like he was becoming the ship. Or it was becoming him.

He heard his father trying to speak, but the acceleration was affecting him too. The *Pella* groaned, the superstructure settling and flexing under the acceleration. A high harmonic overtone rang through the air like a struck bell.

On Filip's monitor, a message appeared. From his father. His captain. Leader of the Free Navy and liberator of the Belt.

FIRE AT WILL.

Chapter Twenty-Seven: Bobbie

Confirm I've got four more fast-movers," Alex said, his voice tense and calm at the same time.

"Got them," Bobbie said, her jaw aching with the acceleration gravity. The gunner's control identified the new torpedoes, adding them to the six already on her scopes. Three ships converging on them from different angles were identified as the *Pella*, the *Shinsakuto*, and the *Koto*. Marco Inaros' personal ship and two gunships for backup, and nothing for the *Roci* to hide behind but her drive plume. The enemies were a long way off still—millions of klicks—and none on initial vectors that did them any favors. The *Roci* had already gotten past them. They were like a kid on a football pitch, running the ball with three opposing players sprinting to catch up. Except if the opposing players had guns.

When the *Roci* hit the mathematical balance point of velocity, mass, and distance that defined the halfway point, there would be some hard choices to make. Either they'd flip and start braking toward Tycho or commit to letting the chase go on indefinitely. If they let the Free Navy spook them out into the empty spaces between bases and stations, the chase turned into an ugly kind of attrition battle. Who ran out of ammunition or reaction mass first. Given how the outer system looked these days, it would make more sense to brake toward Tycho and hope that backup from the station could reach them before the Free Navy pounded them into scrap metal and blood.

Her job and Alex's were to make sure they lived long enough to have that problem. She tracked the torpedoes. With any luck, they'd all be standard issue. They didn't show the jittering path of point defense countermeasures yet. When they got in effective range, the *Roci* would start chewing them to pieces, streams of tiny tungsten rounds ripping the torpedoes to nothing. If there were only six, she'd have been confident they could do it. Ten at once was a little more complicated, but as long as they

didn't all hit at the same time, she was pretty sure they wouldn't be overwhelmed.

Holden's voice in her ear sounded anxious. "How long before we can start shooting back?"

"Fast-movers will be in effective PDC range in sixty-eight minutes," she said. "Do we have any response from Ceres? Because if they could throw a few spare long-range torpedoes at these sonsofbitches, it wouldn't hurt my feelings."

Fred Johnson's voice answered, calm and businesslike. "I'm working on that now."

"Our new friends are closing," Alex said. "We may have to get a little less comfortable."

"Understood," Holden said.

The *Rocinante* was already under a three-g burn. Bobbie felt it in her joints and eyes. The crappy juice dribbling into her veins gave her a distant, cloudy sort of headache and a taste like formaldehyde in her mouth. Below her, the rest of the crew—Holden's and Johnson's both—were strapped in for battle. She could hear Sandra Ip's voice bleeding out from Alex's headset, talking on a private channel. Naomi was talking to someone too, her voice rising from the deck below.

The anxiety and fear in her gut were as familiar as a favorite song. The logic of tactics and violence spread out on the screens, and she found she could see things in them like reading the future. If Ceres fired a barrage of missiles or long-range torpedoes, she knew the *Shinsakuto* would peel off to stop them. She saw how Alex would curve the *Roci*'s path to force a few extra seconds between the Free Navy's incoming torpedoes. The vectors of the enemy ships whispered things in the back of her mind about recklessness and aggression. And she knew that there were other people on each of the incoming ships whose minds were making the same analysis, reaching the same conclusions. Seeing something she didn't or missing a detail that she picked up. All it took was one critical mistake, and they'd be dead or captured. One oversight from the enemy, and they'd get away.

And along with it all—the shitty juice, the battle fear, the desperate effort of keeping her mind clear while all the blood tried to pool at the back of her skull—there was something else. A warmth. A sense of being where she belonged. Her team was counting on her, and her life depended on all of

them doing their jobs with efficiency and professionalism and an unhesitating competence.

When she died, she wanted it to be like this. Not in a hospital bed like her grandmother. Not in a sad little hole on Mars with a gun in her mouth or a gut full of pills like the failures of veterans' outreach. She wanted to win, to protect her tribe and wipe the enemy into a paste of blood and dismay. But failing that, she wanted to die trying. A snippet of something she'd once read popped in her head: *Facing fearful odds protecting the bones of her fathers and the temples of her gods*. Yeah. Like that.

"Shit," Alex said. "I've got six more. We're up to sixteen fast- movers."

"I've got 'em," Bobbie said.

"Why are they spacing them out like that?" Holden asked.

"The *Shinsakuto's* getting ready to flip and burn," Bobbie said. "I'm guessing Fred talked Ceres into helping."

"I did indeed," Fred said. "Just got confirmation."

"If our PDCs are going to have a chance chewing these fuckers up, I've got to punch it," Alex said.

"Everyone in your couches?" Holden said. There was a chorus of response. No one said no. "Do what you need to do, Alex."

He looked over at her. Pilot's and gunner's stations were the only ones in the cockpit. It was designed that way because if systems started failing, they could shout to each other. They had to be able to coordinate, because from now to the end of the battle, no one else mattered. Every other life on the ship was about to become cargo.

"You good for this, Gunny?"

"Let's kill these assholes," she said.

The *Rocinante* jumped forward, hitting her in the back like an assault. Her arms slammed into the gel, her fingers against the control barely able to move. The images on the screen went fuzzy, her eyes deforming past her ability to refocus them. She tensed her legs and arms, pushing the blood back to her core. The couch chimed and a fresh blast of cheap juice hit her bloodstream. Her gasps sounded like someone choking. Eight gs, maybe? Maybe more. It had been too fucking long.

An endless time passed, and then a chime told her the first round of torpedoes were in PDC range, and her targeting solution kicked in. Alex bent the *Roci's* path, forced the attackers to shift. Gave her an extra fraction

of a second between them. The PDCs lit up, going gold on her display as they fired. The deep chattering tapped through the deck with each one like she was playing music. Four torpedoes flamed out at once, but the other six danced away from the streams of metal, then spiraled closer to the ship. Alex banked hard, catching one with the edge of the drive plume, making the other five maneuver. She caught four. The fifth shifted, evaded, streaked close—

Alex tried to yell, but it came out as little more than a high squeak. The ship turned the extra three degrees to bring another PDC arc into play, and the enemy torpedo died, falling behind them in bright shards and melting in their plume.

A message appeared on her screen from Alex. TAKE IT TO THEM?

The two ships were bearing down on the *Roci*, pushing hard to narrow the distance. She didn't know if that was bold or foolhardy. Probably they didn't either. Ships full of Belters weren't known for loving high-g burns, but this was war. You took the risks you had to take. But the third ship had peeled off. And two points, her old sergeant used to say, defined an opportunity. Those bad guys were awfully close to each other.

DONNE, she typed back, and didn't bother fixing the error.

She routed the five torpedoes between the *Pella* and the *Koto* in a starburst. The Free Navy ships were firing PDCs at the *Rocinante* now, the rounds coming like ropes of pearls on the screen. Alex maneuvered around them easily. Range was too far still for close-quarters battle tactics to apply, but maybe the Belters didn't know that. Or just meant it as an insult.

She watched the curving arcs of PDC fire shift to find her torpedoes as they burned for the abstract line between the two ships. Two of hers died. Three. Four. But the fifth curved into the space between the *Koto* and the *Pella* where their tracking software would recognize that the PDC fire that would stop the torpedo would also riddle the friendly on the other side. The two ships lurched apart, and the *Koto* dropped a torpedo that took out Bobbie's attacker just a few seconds before impact.

The maneuver had bought them a few moments, but at the cost of one-quarter of their total torpedo stores. It wasn't a game she could afford to keep playing when the ante was so high. But by then she'd put in her next firing solution and passed it to Alex.

To his credit, he didn't question her. In a single instant, the gravity vanished, the *Roci's* Epstein dropped to zero. Her couch slammed to the side, the hard spin of the maneuvering thrusters whipped them around. The custom-built keel-mounted rail gun made the ship jump as it fired. It was the one weapon the *Roci* had that wasn't standard for a Martian corvette. The rotation continued until they were back on their old course, and then ten gs slammed her back into her couch as the Epstein drive kicked back on and the counterthrusters killed the spin.

A high-speed three-sixty with a precision-timed rail gun shot halfway through the spin wasn't exactly standard combat tactics for Martian frigates, but she thought her old combat-tactics instructors would have approved.

The sudden crushing weight of thrust brought a wave of nausea, and her heart stuttered in a confusion of fluid dynamics and pressure. She must have blacked out for a moment, because she didn't see the *Koto* hit. Only the glowing plume of superheated gas expanding behind it where it had dropped core. Even pressed into the crash couch, she managed a smile. She waited to see if the *Pella* would break off, go to the aid of her fallen comrade.

It didn't.

Bobbie fed a new firing solution, passed it to Alex, and they tried again. A weightless, spinning moment, the kick of the rail gun, and slammed back into the couch like an assault. The *Pella* knew now. At the vast distances between them, even the fraction of a second that it took to spin the *Rocinante* around was enough for the enemy to anticipate them and dodge. She threw two more torpedoes at the *Pella*, but they were shot down well before they could do damage.

The *Pella* launched another round of torpedoes, but without the *Shinsakuto* and the *Koto* to box them in, Bobbie wasn't worried. The complexities of the battle looked to be over. Now it became longer and simpler and worse. Something in her trachea slid where it wasn't meant to be and she forced out a cough, her head spinning a little when she did.

This was how they'd end now. A long, desperate race to see who ran out of PDC rounds or torpedoes first. Who had allies near enough to complicate the situation. But before any of that, there was the braking threshold. The point of no return at which they wouldn't have enough reaction mass left to match the thrust they'd already pumped into their vector. They'd be trapped

in a desperately long orbit, at the mercy of whoever came for them. *That* was her hard deadline.

Fighting to move her fingers against the built-in controls, she sent a message to Holden: DISTRACT THEM.

A moment later, a reply arrived: ???

DISTRACT THEM.

Bobbie waited for the inevitable calls for clarification, but was pleasantly surprised when instead the comm array went active. A tightbeam. To the *Pella*. She saw the connection accepted. Good. She tried to count down from five, but got lost somewhere around three. She breathed through gritted, aching teeth, and re-sent the firing solution. Float, spin, fire, and slam back into the couch, spine shrieking and mind fluttering on the edge of blackness. It hadn't done any good. The *Pella* had dodged again.

There had to be a way. She couldn't let the enemy run them out. She couldn't let her team down again. There had to be a way. They could fire a fraction of a second earlier ... but the keel mount meant the *Roci* could only fire straight ahead. A tear pressed out of her eyes, slamming to the gel beside her ear like a stone. Were they still at eight gs? She looked at the firing solution through blurred eyes. There had to be something. Some other way to draw a straight line between two points.

She could try again, but the *Pella* would dodge the way it had before. The rail gun could only draw perfectly straight lines, and now that the *Pella* knew what their spin meant, its computers would be very good at predicting the slug's flight path and adjusting.

Something. Something there. The tiny, shining limn of an idea. The *Pella* would dodge the way it had before.

So how did it dodge before?

Her wrist creaked as she pulled the battle record up, moving back second by second. Twice the *Pella* had dodged the rail gun. Both times by firing all her port maneuvering thrusters—sidestepping—and then correcting on the starboard. It kept her pointing the same direction, not veering away. But if it was a habit ...

She fed the firing solution in again. The moment of sickening spin, the bang of the rail gun, the crack of the couch taking her in. But the *Pella* did it again. It dodged the same way. It was a pattern, and patterns were gaps in

the armor. She could fit a knife in there.

The formaldehyde taste in her mouth was heavy and chemical. They were out of PDC range, but that was only convention. PDC rounds didn't magically evaporate or slow down. Every tungsten slug that hadn't hit its target in battle was still out there in the black somewhere, speeding on as fast as the moment it had left the barrel. It was only the overwhelming vastness of space that kept every ship out there from being holed at random.

This wasn't fucking random, though.

Her fingers ached. Her head ached. She didn't care. She pulled up the speeds of everything she had—PDC rounds at so many meters per second. Torpedoes started slower, but followed a sharp acceleration curve. Rail-gun rounds ... she rechecked the number. Okay. Rail gun rounds went really fast.

It was a puzzle. It was only a puzzle. There was an answer, and she could find it. There would be one chance. She keyed in the new firing solution, everything tied together.

You are mine, you piece of shit. You are mine now.

She passed it over.

The *Rocinante* shuddered, the vibration of the PDCs made more violent by the high-g burn. On her screen, it looked like a cloud of gold. Thousands of rounds spinning out to kill torpedoes that weren't there. Too imprecise to hit the *Pella* at this range, and not in the right place anyway. It looked like a misfire. A malfunction. It looked like nothing. Then the torpedoes launched. Three of them, spitting toward the *Pella* in tight curves. The obvious danger. Shards of white showing internal strain, vector, guiding themselves toward their target and accelerating toward the *Pella's* port side. The *Pella's* PDCs opened up, spraying toward the incoming, evasion-drunk torpedoes. For long, terrible minutes, the pieces of her puzzle moved into place.

It wasn't going to work. They were going to see it. As clear as it was to her, they had to be able to see it too.

The torpedoes sped in, driving toward the *Pella's* flank and the withering fire of her PDCs. The *Pella* dropped three torpedoes of her own. Bobbie's golden cloud of PDC rounds was almost in position.

Alex killed the engine as he had before. Spun them. The rail gun fired in the split second it came to bear on the *Pella*, the spine of the ship creaking.

Before Bobbie could see what had happened, the *Roci* completed her arc, her drive returning as it had before. And the *Pella*—flagship of the Free Navy and private gunship of Marco Inaros—dodged the rail gun round just as it had before. *Just* as it had before. By sidestepping away from the torpedo battle to its port.

And into the path of the oncoming cloud of PDC rounds.

There was no way to know how many hit, but the *Pella* veered off course, its main drive still firing full out even as it turned almost orthogonally to the direction of the *Rocinante*. Alex eased off, and a mere three-g acceleration felt like being light as a balloon. Bobbie checked the stores and noted she'd already fired half her torpedoes, so she fired half of what was left, sending five more after the *Pella*, one after the other streaming toward the wounded ship's drive cone. The *Pella* had lost at least one thruster on her starboard and struggled to bring PDCs to bear.

And then it got hard to see what happened, because the enemy drive plume was pointing straight at them, the *Pella* retreating up out of the ecliptic and toward the uncaring stars. Alex cut the drive, leaving them on the float. The back of Bobbie's head was wet. Either she'd been sweating or the tears pulled from her eyes had pooled. Or her skin split and she was in her own blood. No matter what, it felt great.

Alex was staring at her, his eyes wide, shaking his head. Slowly a grin pulled at his lips. He started chuckling, and then she did too. Her ribs hurt. Her throat hurt. When she tried to move her left arm, the elbow protested like it had been dislocated and shoved roughly back into place.

"Holy shit," Alex said. "I mean just holy fucking *shit*."

"I know," she said.

"That was *great*!" Alex whooped, and punched the air. "We did it! We kicked their butts!"

"We did," Bobbie said, closing her eyes and heaving a deep, slow breath. Her sternum popped like a firecracker, and she started laughing again. A thin sound, distant as home, plucked at her awareness. She realized she'd been hearing it for a while, but hadn't registered it in the heat of battle. Now that she heard it, she recognized it at once.

It was a medical alarm.

Chapter Twenty-Eight: Holden

When Holden left the Earth Navy, he'd had a dishonorable discharge on his record and a sense of relief and righteous anger stiffening his spine. He'd thought at the time that the greatest irony of his newly fallen position in life was that, while his career options were now substantially narrowed and his status in the world dimmed, he felt freer. Looking back at it now, that freedom only earned second place after the subliminal, barely expressed relief that he wouldn't see any more ship-to-ship fighting.

Since the *Rocinante* had become his home, he'd tracked down pirates for the OPA. Battled over Io. The slow zone. Ilus. If he'd sucked it up and stayed in the service, he'd have been a thousand times safer. It wasn't something that had occurred to him before. In all the previous battles, he'd been in charge. Working for so many years with a skeleton crew of only four made frantic action the norm. Between his crew and Fred Johnson's now, every station had someone in it, and a backup ready to step in besides. Even with the high burn pressing him into the couch so hard he could barely breathe, there was a deeper urge to do something. To take control of some corner of the action. To have an effect.

The truth of the matter was that anything he did now would get in someone else's way. Watching the tactical map and trying not to pass out were literally all he could usefully manage. Even calling Ceres for help had been someone else's job. And Fred, in the couch at the far side of the command deck, had done it better than he could have. When a power exchange blew out and switched to the fallback, Amos or Clarissa had flagged it for repair before he could remember how to pull up the damage control schedule. Mfume and Steinberg were at stations amidships, Lombaugh and Droga down in engineering, two teams of pilot and gunner ready to take over if the Free Navy cleaved the cockpit off the ship. So he watched the *Shinsakuto* falling away to intercept the long-range torpedoes

from Ceres and then shifted to the *Koto* and the *Pella*—Marco Inaros' ship—as they raced up at them from below like sharks.

Naomi was in the next couch over, breathing in ragged gasps. He wanted to talk to her, to ask if she was okay, to offer her some sort of comfort. He tried to imagine her response. Something that meant, *I appreciate that you care, but the time to talk through my emotional well-being isn't during a firefight*. It was just another way that he could try to control something. Make something better. Anything. She was less than a meter from him, and a million clicks away.

When the drive cut out and the ship spun hard, he knew they were dead. Then thrust slammed him back into his couch. For a few seconds he'd wondered whether it had actually happened, or if he was starting to hallucinate, but then he saw the *Koto* falling away beneath them. Even then it took a few seconds to understand what had happened, just in time for it to happen again. He heard Naomi cry out as the impact of the couch hit them all again.

He wanted to shout up to Bobbie that she had to stop it. That there were people in the ship—some of them Belters. And anyway no one had grown up in gravity hard enough that they could shrug off eight-g impacts all day, crap-ass third-rate juice or not. But he couldn't even do that, because if she was doing it, she probably was right to. The best he could do was hate it and endure.

All of which was why, when something finally did arrive that he could do, he was practically giddy with relief.

DISTRACT THEM.

He stared at the words with blurry, aching eyes. Who was Bobbie asking him to distract? The crew? The enemy? He forced his fingers to the controls, managing ??? only with some effort.

The answer came back just the same. DISTRACT THEM.

Holden stared at the words. As much as he wanted to help, there really wasn't much he could do that the ship wasn't already doing. The ECM package was spraying radio chatter at the pursuing ship, doing its best to blind the enemy torpedoes. The comm laser was throwing as much high-frequency light into the *Pella*'s sensors as it could pump out. As far as distractions went, the *Roci* was already doing her best. He forced another

painful breath.

On the other hand, what else was he doing? And thinking about the comm laser gave him an idea.

He grabbed the comm control and put in a tightbeam-connection request to the *Pella*. Maybe they'd think he was asking for their surrender. Or offering his. Intellectually, he knew there had to be some anxiety in him. This was Marco Inaros. The man who'd killed the Earth. Who'd tried to capture Naomi and kill him. But between the ache of the burn and his juice-regulated heartbeat, he didn't feel it.

The tightbeam picked up carrier, paused while it negotiated wavelength and data protocol, and then the connection was accepted, and Holden was looking up into the eyes of Marco Inaros. He'd seen pictures of the man. Watched the videos of his press releases. He knew the face as well as he might any third-rate celebrity. Thrust had pulled back Marco's hair, stretched his skin, pushed his cheeks back and in. It made him look younger than he was. Holden hoped it was doing the same for him.

He hadn't assumed that the *Pella* would brake enough to make conversation possible. Whatever he was going to do, he'd thought it would be in text. But now that they were facing each other, he thought this might be enough. The monitor was only about sixty centimeters from Holden. Marco's would be about the same. It created the illusion that they were close to each other. He could see the little flaw in Marco's hairline where it curved back at the right temple. The blood vessels in his eyes. It felt intimate. Almost embarrassing. And, motionless as they were, there was also an uncanny feeling, like looking into the mirror and seeing someone else looking back. Here was a man who'd taken on the fate of humanity like it was a part-time job, right here in front of him. Close enough to touch.

It was hard to be certain what emotions were actually in Marco's expression and what Holden only imagined. A defiant sneer. Then confusion. Maybe they were there; maybe they were only what he expected to see. He was certain, though, that a malicious gleam came into the man's eyes at the end. The effort of working his controls showed in Marco's face, and Holden expected a message to come through. A taunt, an accusation. He was wrong.

Marco clicked away, and a new face appeared. Younger. Darker. As crushed by the acceleration, but unmistakable. Filip Inaros. The boy didn't

look at Holden, didn't seem aware of him. Holden, it seemed, wasn't showing on his monitor. Marco was only giving Holden a moment to look at the boy.

He didn't know what he was supposed to see there. Maybe it was a vulgar masculine boast. *She may be with you now, but I fucked her first.* That seemed about Inaros' level. Maybe it was to show that the son hated them as much as the father. But where looking at Marco had felt awkward, seeing Filip was actually fascinating. Holden couldn't help searching for traces of Naomi in the younger, masculine face. The epicanthic fold at the corner of his eyes. The angle of his cheeks and the shape of his lips. The way he moved reminded Holden of Naomi struggling under a burden.

What struck him most was how young the boy looked. At that age, Holden hadn't left Earth yet. Had still been waking up at the ranch in Montana, having breakfast with his many parents before going out to mend fences and check the turbines at the wind farm. Thinking of the Navy because Brenda Kaufmann had broken up with him, and he was sure he'd never get over her.

There were mistakes you made because you were young. Everyone made some of them.

Thrust cut out. Holden's couch snapped to the side again, bucked as the rail gun fired, and slammed back into him. On his screen, the boy's eyes widened as his couch swiveled. Something loud happened on the *Pella*. Someone shouted. The high whine of a medical alert. The tightbeam dropped as the thrust gravity on the *Roci* dropped back. Still more than usual, but after that long pushing at eight gs, his body's response was profound and visceral. Naomi's moan was half pain, half relief. People were shouting in his ear: delight and exaltation. His mouth tasted like blood. His elbow ached as he reached for the monitor, switching to tactical without the in-couch control. Alex's voice, muffled like they were both underwater, reached him. *That was great. We did it. We kicked their butts.*

The *Pella* was burning away, still under high thrust, but racing away. A wave of the *Rocinante's* torpedoes raced after them. Without thinking, he disarmed them.

His fingers hesitated above the screen, his mind falling apart and coming back together and falling apart again the way it did at the end of a long burn. The blood reperfusing through his brain carried strange, fleeting

sensations. His left leg cold and wet, like he was standing in a river. The smell of burning hair. A sense of unfocused moral outrage that flickered and went out as suddenly as it had come. He pressed his hands to his eyes and coughed. Pain shot down his spine. His ears rang. Tinnitus.

No, not tinnitus.

“Jim.”

He wrenched himself around, fighting against the unnatural weight of his body. Naomi was struggling in her couch, futilely trying to rise in the heavy g. Her face was ashen. His half-functioning brain leaped to panic. She was hurt. *Something’s wrong. This is my fault.*

“What?” he said, his voice rough and phlegmy. “What happened?”

Bobbie came down from the cockpit, muscles straining on the ladder rungs. Naomi looked from him to her and back again. She was pointing at something, gasping to get words out.

“Fred,” Naomi said. “He’s having a stroke.”

“Oh,” Holden said, but Bobbie had already surged forward, undoing the straps and half lifting Fred out of his couch. At their current acceleration, the old man had to weigh over two hundred kilos. Bobbie nearly collapsed but stayed on her feet, her arms wrapped around his upper body, trying to pull him free of the restraints. Holden staggered to the lift and shouted up. “Alex! Cut thrust. Put us at a third of a g.”

“Hostiles are still—”

“If they shoot at us, do something clever. We’ve got an emergency.”

The gravity let go again. Holden’s spine lengthened. His knees felt like they were swelling. Bobbie, now carrying Fred in her arms, was on the lift, dropping toward the medical bay. Fred looked tiny cradled against her, his eyes closed. Holden told himself that the old man’s arm draped around Bobbie’s shoulder was clinging to her. Had strength. He didn’t know if it was true.

A cacophony of voices shouted in his ear. Everyone asking what had happened. What was going on.

“Steinberg!” he barked. “You’re on weapons. Patel, take the comms.” Then he pulled off his headset. The lift was coming back up for them, the gentle hum barely audible in the noises of the ship, and the only thing he had ears for. He willed it to go faster.

Naomi put a hand on his shoulder. “It’s going to be okay.”

“Really?”

Naomi shrugged helplessly. “I don’t know.”

The lift came. They loaded on, descending for the crew deck. If the *Pella* got itself back under control, it could loop around. The fight could start again at any second, catching them away from their crash couches. Holden knew they should be burning hard, rushing toward Tycho as fast as they could. He walked through the tight, military corridor, into the medical bay. It felt like he was in a different ship. Everything was just where it always was, but it seemed new. Fresh. Foreign.

Fred lay on the table, stripped to the waist. The autodoc was strapped to his arm, needles inserted into the veins. He looked weirdly vulnerable, as if he’d physically shrunk between the time he’d gotten into the crash couch and now. Bobbie stood over him, arms crossed, glowering like an angel out of the Old Testament. One of the scary kind. The kind that kept you out of paradise and killed armies in a single night. She didn’t look up as they came in.

“How bad is it?” Holden asked.

Somehow Bobbie made her shrug an expression of rage. “He’s dead.”

He didn’t know how Amos and Clarissa got the duty of preparing the body, but whatever the mechanism, it turned out to be a good fit. Amos stripped him, and Clarissa cleaned Fred’s skin with a damp cloth. Holden didn’t need to be there for it. Didn’t have to watch. Except that he did.

They didn’t talk. Didn’t make jokes. Clarissa swabbed Fred’s body with a calm, businesslike intimacy. Compassionate and unsentimental. Amos helped when Fred needed to be moved and dressed in a fresh uniform and when she needed to slide the body bag under him. It took a little less than an hour from start to finish. Holden didn’t know if that seemed like too long or not long enough. Clarissa hummed something as she worked. A soft melody he didn’t recognize, but one that didn’t seem to rest in either a major key or a minor one. Her thin, pale face and Amos’ thickness seemed perfectly matched. When the bag was sealed, Amos hefted it. Easy to do. They were still barely above a third of a g.

Clarissa nodded to Holden as they passed out of the medical bay. Her skin was bruised at the back of her neck and all along the arms where the blood had pooled during the burn. “We’ll take care of him,” she said.

“He was important,” Holden replied, and wasn’t ashamed at the catch in his voice.

Something like sorrow or amusement flickered in Clarissa’s eyes. “I’ve spent a lot of time with the dead. He’ll be okay now. You go take care of the ones that lived through it.”

Amos smiled amiably and carried the bag out. “You need to get drunk or in a fistfight later, just let me know.”

“Yeah,” Holden said. “All right.”

After they left, he stood beside the empty medical table. He’d been on it more than once. Naomi had. Alex. Amos. Amos had regrown most of a hand in this room. That death had come randomly—stupidly—seemed obscene even though it was mundane enough. People stroked out. Fred was older than he’d once been. He was dealing with high blood pressure. He’d been going without sleep, pushing himself. The juice they had was lousy. It had been a long battle and a hard burn. All of it was true. All of it made sense. And none of it did.

The others were still at their stations, but the word had gotten out by now. He was going to have to face them at some point. He didn’t know what he’d say to Fred’s crew. *I’m so sorry*, but after that?

He brushed his hand on the mattress, listened to the hiss of skin against plastic. It felt colder than he’d expected. It took him a second to realize it was the dampness from Clarissa’s cloth evaporating. He recognized Naomi by her footsteps.

“Do you remember when it came out he was working with the OPA?” Holden asked.

“I do.”

“It was the only thing on any of the newsfeeds for ... I don’t know. A week. Everyone saying he was a traitor and a disgrace. Talking about whether there should be an investigation. Whether he could still be brought up on charges even though he’d resigned years before.”

“What I heard was more equivocal,” Naomi said. She came into the room, leaned against one of the other tables. She pulled her hair down over her eyes like a veil as she spoke, then scowled and brushed it back. “The

people I knew assumed he was a mole. Earthers trying to Trojan horse their way into our organization.”

“Was it still your organization back then?”

“Yeah. It was.”

He turned, pulled himself up to sit on the table. The autodoc, sensing his weight, pulled up the start screen, glowed hopefully for a few seconds, and turned back off. “I just can’t remember a time when Fred Johnson wasn’t someone important. It’s just ...”

Naomi sighed. He looked at her. The lines on her face that hadn’t been there when he’d met her. The way the line of her jaw had changed. She was beautiful. She was mortal. He didn’t want to think about it.

“Every faction of the OPA Fred could bully or beg or cajole into coming together is waiting for us at Tycho,” Holden said. “And we’re going to have to tell them Marco won.”

“He didn’t win,” Naomi said.

“We’ll have to tell them we were ambushed and Fred died, but Marco totally didn’t win.”

Naomi smiled. Laughed. It was strange how it made the darkness better. Not less dark. Just better, even though it still was what it was. “Well, all right, when you put it that way. Look, worst-case scenario is we don’t get them on our side. I’m not saying it wouldn’t be great to have more of the Belt on our side. But if we don’t have them to work with, we don’t. We can still win.”

“Only the war,” he said. “Not the part that matters.”

Chapter Twenty-Nine: Avasarala

Gorman Le blinked, rubbed his entirely-too-green eyes, and waited for her to respond.

“And you don’t know where it came from?” Avasarala said.

“Well, Ganymede,” he said. “The transmission records are clear. It definitely came from Ganymede.”

“But we don’t know who on Ganymede.”

“No,” he said, nodding to mean yes, she was right. Fucking confusing way to express himself.

The meeting room was a smaller one in Nectaris facility. The lights were cold, the walls a brushed ceramic that hadn’t been fashionable in thirty years. It was on a physically separate environmental system, so the air didn’t have the recently rebreathed smell that most of Luna suffered these days. If the gunpowder stink of lunar fines was there, she’d gotten so used to it that she couldn’t tell.

Gorman Le sat hunched forward like a schoolboy, a glass of water forgotten in his hand. He was wearing the same suit he’d had on yesterday and the day before. She was starting to think he kept it in a closet and threw it on whenever he had to talk with her. Weariness radiated from him like he was a medic on the last hour of a four-day shift, but there was something else in him. Something she hadn’t seen recently. Excitement, maybe. Hope.

That was bad. Lately, hope was a poison.

“So the report schema or whatever the hell you call it could be real,” she said. “Or it could be the Free Navy trying to fuck with us. Or it could be ... what?”

“Nutritional yeast with advanced radioplasts. We’ve been looking at how the protomolecule was able to grow based on some kinds of ionizing radiation?” The rise of inflection at the end made it a question, as if he were asking her permission instead of debriefing her. “Nonionizing too, but that’s

really easy. Light's nonionizing radiation, and plants have been harvesting that since forever. But—"

Avasarala raised her hand, palm out. Le's mouth kept moving for a few seconds, part of him still speaking while the rest was reined in. "I care deeply about all the fine details," she said, "only actually, I don't. Sum it up."

"If the numbers are right, we could feed maybe half a million more people on this base right now. The first runs we did looked really good. But if it's something that doesn't scale and the farms crash, we could lose days cleaning it back out."

"And then people starve."

Gorman nodded some more. Maybe he didn't mean anything by it. "Resetting would definitely mean missing some production goals."

She leaned forward, plucked the glass from his hand, and looked into his eyes. "Then people starve. We're grown-ups here. You should be able to say it."

"Then people starve."

She nodded and leaned back. The terrible thing was that her back felt better. She'd been at one-tenth of a g for so long, she was getting used to it. When she went back down the well, she'd have to reacclimatize. When. Not if. Gorman was looking at her, his jaw set, his nostrils flared like a panicky horse. She had to restrain herself from patting his head. She wanted some fucking pistachios.

"What's your doctorate in?" she asked.

"Um. Structural biochemistry?"

"Do you know what mine's in?"

He shook his head for a change.

"Not structural biochemistry," she said gently. "I don't know anything about whether this magic yeast recipe is bullshit or not. So if you can't tell, I'm less than fucking useless. So what are we here for?"

"I don't know what to do." He looked young. He looked lost.

The impulse to snap at him fought with the impulse to hug him. She closed her eyes, and damn it but they felt good closed. This morning, it had been a coordination meeting with the Lagrange stations talking about refugee loads, then security and resources talking about policing guidelines for the people still coming up the well. Over lunch, reports of an armed

uprising in what was left of Sevastopol—people panicking as food and water ran low. It was all bleeding together in her mind, one long, ongoing, weary sense of urgency.

She wanted to be angry with Le, but either she understood his frozen panic too well or else she just didn't have the energy anymore. "Is it a good bet?"

"I think so," he said, almost at once. "The data looks—"

"Then implement it. If it doesn't work, you can blame me."

"That's not what I was ... I mean ... If a larger scale production run works here, we should really look at sending this down the well." *Down to Earth. Where they were even hungrier.*

She opened her eyes. Something in them made Gorman look away.

"Yes, ma'am. I'll see that it's done."

She rose. The meeting was over. Only when she was out the door and shuffling across the yellow-gray paving toward her cart did she think about giving Le some kind of encouragement. A pat on the shoulder. A gentle word. She'd backed him down out of habit, not because he needed to be brought into line. She used to be better at this.

As the cart lurched forward, she pulled up a connection to Said. He appeared in a half-sized window that left room for her calendar and notes, almost too small to make out more than his V-shaped face and high, curly hair floating above a collarless blue shirt. "Ma'am?"

"Where do we stand?"

"You have a report from Admiral Pycior on the Enceladus situation waiting for review."

"Is it going to say anything besides 'The Free Navy fucked off before we got there and now we have more people we need to feed,' or do I already have the gist of it?"

"That's the gist. There were some casualties on our side. The *Edward Carr* is also going to need extensive repairs."

She nodded. Another fucking battle like trying to grab water in her fist. The cart turned, dipped into an access tunnel. Two security guards saluted as she passed. The cart turned down another ramp, slotted itself into the highspeed toward the government and administration centers at Aldrin, and turned again so that she could look back down the throat of the passageway. Gray walls with white archways retreating back and up. The air like an

eternal exhalation. The architecture seemed small in context. Insignificant against the tremendous scope of Luna and Earth. She clung to it like a lifeline. “Reports from Ceres are that the *Rocinante* was ambushed, but escaped. It’s on course toward Tycho Station.”

“Small favors,” she said.

“You also have a personal meeting on the schedule, ma’am.”

Personal meeting? For a long moment, she couldn’t remember what it was, but as the highspeed line lurched, pulled her cart in, and began its acceleration run, she remembered that Ashanti had been asking to see her. Somehow, her daughter had wheedled Said into putting her on the calendar.

“Cancel that,” Avasarala said.

“Are you certain, ma’am?”

“I don’t want to spend half an hour listening to a girl whose diapers I changed lecture me about taking care of myself. Tell her I’m tired and napping.”

“Yes, ma’am.”

“Do you have something you want to say, Mr. Said?”

Said coughed. “She’s your daughter, ma’am.”

Avasarala smiled. It was the first time Said had pushed back at her. Maybe there was hope for the little fucker yet. “Fine. Give her the first dinner slot that’s still open.”

“That’s three days.”

“Three days, then,” Avasarala said. The highspeed stopped accelerating, leaving her rocketing through the evacuated tunnel at however many hundreds of kilometers per hour it went. Enough to take her halfway across the face of the moon in half an hour. A body in motion remained in motion. It was a metaphor as much as anything. Stay in motion, because once she rested, she didn’t know how she would bring herself to ever start again.

She couldn’t remember how long it had been since she’d meditated. It used to be that when things were bad at work, she spent more time sitting, not less. Listening to her own breath rattle through the complex spaces at the back of her nose, being with her body in a deep and connected way that let all the shit settle. If she’d been keeping up, she’d have remembered to encourage Gorman Le, for instance. She hated to guess how many other little fuckups she’d passed by without even noticing.

The highspeed tunnel curved, pushing her gently against the cart’s door.

She told herself that between the war and the recovery, there was just too much to do. That was accurate as far as it went, but she'd spent too many years becoming familiar with her own mind to entirely ignore the fact that she was bullshitting herself. Meditation was there so that she could be with herself, experience what it meant to be Chrisjen Avasarala more deeply. And since she was fairly certain Chrisjen Avasarala was a bag of sorrow and glass right now, fuck that. Meditating deeply so that she could really, clearly experience being angry and lonesome and hurt and horror-struck never seemed as good as a strong gin and tonic and another hour of work.

She could be a basket case later. When things were under control.

The highspeed had just started slowing down when her hand terminal chimed. Said looked contrite, but not so much that he'd left her alone.

"Priority message for you from the *Rocinante*, ma'am."

"The fuck does Johnson want now?"

"It's not from Colonel Johnson. Captain Holden sent it."

She hesitated. In his window, Said waited. "Send it to me," she said.

Said nodded as she closed his window. She threw the readout to the cart's screen. Whatever was going on, she wanted to be able to see it without squinting. The message appeared, flagged with red. As soon as she opened it, she knew. Death was on Holden's face as clearly as if it had been written there. When he spoke, his voice was careful and controlled. Hospital tones. Funeral.

He laid out what had happened briefly, not giving any details she didn't need. The *Pella* had led the attack. They'd managed to fend off the Free Navy. Fred Johnson was dead. And then, as if Holden were having a stroke of his own, he stared for a long moment into the camera. Into her eyes, without seeing her.

"All the OPA groups Fred called together at Tycho are waiting there. We're on course and starting our deceleration burn. But I'm not sure if we should still be going there or if there's someone you want to send. Or how long they'll wait. I don't know what to do next."

He shook his head. He looked young. Holden always looked young, but usually it was young and impulsive. The lost expression around his eyes was new. If it was even there. Maybe she was only seeing it because she felt it in her own heart, her own belly.

The message ended. The terminal prompted her for a response, but she

only sat with it in her hand as the highspeed came to a halt, the cart pouring itself into more familiar corridors. She looked at her hands, and they seemed to belong to some other woman. She tried sobbing, but it seemed forced and inauthentic. More like playacting than grief. If she'd been in control of the cart, she might have let it drift into the wall or down any random corridor, all unaware. But it knew where to go, and she didn't think to take it to manual.

Fred Johnson. Butcher of Anderson Station. Hero of the UN Navy and traitorous voice of the OPA. She'd known him in person and by reputation for decades. He'd been her enemy and opposite and occasional untrusted ally. The part of her that was still thinking noticed how odd it was—how implausible—that his death should be the drop that made her cup overflow. She'd lost her world. Her home. Her husband. If she'd kept any of those, maybe this wouldn't have destroyed her.

Her sternum ached. Actually ached. Like there was a physical bruise there, and not only emotion left too long pressing at her flesh. She probed it with her fingertips, tracing the boundaries of the pain like a child fascinated by a dying insect. She didn't notice the cart had stopped until Said opened the door.

"Ma'am?" he said.

She stood. The lunar gravity seemed less like a force of nature and more like a suggestion. As if she could rise against it through simple force of will or the beating of her heart. She noticed Said again, noticed that she'd forgotten he was there. He looked distressed in an officious, too-pretty way.

"Please cancel everything," she said. "I'll be in my rooms."

"Do you need anything, ma'am? Should I get a doctor?"

She frowned at him, the muscles in her cheeks seeming to exist at a distance. She was piloting her body like it was a mech with failing controls. "What would that help?"

In her rooms, she sat on the divan, her hands cupped in her lap, palms up. Like she was holding something. The air recycler's fan had a little noise to it, resonant and unsteady. Wind passing over a bottle's mouth. Mindless, idiot music. She wondered if she'd ever noticed it before, and then forgot it. Her mind was empty. She wondered if there was something coming. Some overwhelming flood that would carry her away. Or if this was simply who she was now. An empty woman.

She ignored the knock at her door. Whoever they were, they'd go away. Only they didn't. Her door slid a few centimeters open. And then a few more. She thought it would be Said. Or one of the admirals. Some functionary of governance come, like Gorman Le, to ask her to carry the weight of loss and uncertainty for them. It wasn't.

Kiki wasn't a little girl anymore. Her granddaughter was a woman in her own right, though a young one. Her skin was deep brown like her father's, but she had Ashanti's eyes and nose. A glimmer of Arjun in the color of her eyes. As much as Avasarala tried to hide it, Kiki wasn't her favorite granddaughter. The girl always had an air of observing judgment that made being with her difficult. Kiki cleared her throat. For a long moment, they looked at each other.

"What are you doing here?" Avasarala asked. She'd meant it to drive the girl away, but it didn't. Kiki came in and closed the door behind her.

"Mother's hurt that you rescheduled us again," Kiki said.

Avasarala twitched her hands, fingers splayed, palms up. Exasperation without the energy behind it. "Did she send you to lecture me?"

"No," Kiki said.

"What, then?"

"I was worried about you."

Avasarala snorted in derision. "Why would you worry about me? I'm the most powerful person in the system right now."

"That's why I'm worried about you."

That's not your fucking job floated at the back of her throat, but she couldn't say it. The ache in Avasarala's sternum sank deeper, pressing in past bone and cartilage. Her vision went blurry, tears sheeting across her eyes with too little weight to pull them down. Kiki stood by the doorway, her face expressionless. A schoolgirl before her principal, waiting to be scolded. Without speaking she shuffled forward in the scant gravity, sat at Avasarala's side, and lowered her head to her grandmother's lap.

"Mother loves you," Kiki said. "She just doesn't know how to say it."

"It was never her job to," Avasarala said, her fingers smoothing her granddaughter's hair the way they had her daughter's once when they'd all been younger. Some other time before the world had shattered under them all. "Love was always your grandfather's work. I loved"—her breath caught—"I loved him very much."

“He was a good man,” Kiki said.

“Yes,” she said, running her fingertips through the girl’s hair. Tracing the paler line of her scalp.

Minutes passed. Kiki shifted a little, but only a little. Grandmother and granddaughter were quiet. The tears in Avasarala’s eyes weren’t thick. Didn’t fall. When she blinked them away, none rose to take their place. She considered the curve of Kiki’s ear the way she once had Ashanti’s, when her daughter had been a little girl. And Charnapal, when he’d been a child. Before he’d died.

“I do the best I can,” Avasarala said.

“I know.”

“It isn’t enough.”

“I know.”

A weird peace seemed to flow over her. Into her. For a moment, it was as if Arjun were there. As if he’d spoken some perfect bloom of a poem to her instead of only her least favorite granddaughter bearing witness to her failures. Everyone had their beauty and their way of expressing it. It was only hard for her to love Kiki because they were so much like each other. Exactly alike, if she were being honest. That made loving her too much dangerous sometimes. She knew what being herself had cost her, and so seeing herself in Kiki made her so very afraid for the girl. Avasarala heaved a great sigh, plucked at the girl’s shoulder.

“Go tell your mother I had something fall through, and we should eat together. Tell Said too.”

“He was the one that let me in,” Kiki said, sitting up.

“He’s a fucking busybody and he should stop putting his fingers in my shit,” Avasarala said. “But this one time, I’m glad he did.”

“So you won’t punish him?”

“Fucking right, I’ll punish him,” she said. Then, almost to her surprise, she kissed Kiki’s smooth, unlined forehead. “It’s just this time I won’t mean it. Go now. I have something I need to do.”

She’d expected her makeup to be ruined, but it really wasn’t. A touch of eyeliner and a stray lock of hair tucked down was all she needed to look like herself again. She pulled Holden’s message back up, let it play while she composed herself in the eye of her terminal’s camera.

When the prompt to reply came, she squared her shoulders, imagined

herself looking into Holden's eyes, and started the recording.

"I'm sorry to hear about Fred. He was a good man. Not perfect, but who is? I'll miss him. What we do next is simpler. You get your sorry ass to Tycho Station and make this work."

Chapter Thirty: Filip

The *Pella* limped along at a third of a g. After so long on the float, Filip felt even that in his knees and spine. Or maybe it was only that he was still bruised by the god-awful forces of the battle now behind them.

The battle they'd lost.

He stood in the galley, a bowl of Martian-designed rice noodles and mushrooms in his hand, and looked for a place to sit, but the benches were all filled. The *Koto* had taken it worse than the *Pella*—a rail gun round holing the reactor and cracking the hull from stem to stern. Most of the ships Filip had lived on would have died in that same second, but the Martian Navy had built with battle in mind. In a slice of a second so thin you could see through it, the *Koto* had registered the hit and dropped core, leaving the crew trapped and helpless, with only the battery backups to keep them alive.

The *Shinsakuto* had been driven away from them, hounded and harassed by fighting ships and torpedoes from the consolidated fleet and Ceres. If the *Rocinante* had finished its job on the *Pella*, the crew of the *Koto* would still be out there on the float. Or maybe they'd be dead by now, the air recyclers finally failing and leaving them all to gasp and choke and claw each other in their death panic. Instead, they were all on the *Pella*, hot-bunking with the usual crew, taking up space on the galley and pointedly not making eye contact with Filip as he looked for his place among them.

His own crew was there too. Men and women he'd been shipping with since before it all began. Aaman. Miral. Wings. Karal. Josie. They were looking away as much as the others. Only about half of them were wearing their Free Navy uniforms. *Koto* and *Pella* both had dropped back to the simple functional clothes that any crew might wear, and some of the ones still in uniform had rolled up their sleeves or left their collars open. Filip felt his own uniform, crisp and fresh and done to the neck, and for the first

time he felt a little foolish in it. Like a kid dressed in his father's clothes as a costume.

The murmur of conversation was a wall that excluded him. He hesitated. He could just take the bowl back to his quarters. It wasn't really that they were keeping him apart. It was only that they were so crowded now, and stung from having lost a fight. He took a step toward the corridor, intending to go. Meaning to. And then stopping and looking back in case there was some slot, some corner of bench, that he'd overlooked. Some place for him.

He caught Miral's eye. The older man nodded, and—Filip thought with a sigh—shifted to open a little room beside him. Filip didn't run there like a little boy, but he went quickly, worried that the gap might close again before he reached it.

Karal was sitting across from Miral, and all of them sandwiched by unfamiliar bodies. A woman with dark skin and a scar across her upper lip. A thin man with a tattoo on his neck. An older woman—white, close-cropped hair and a crooked, unfriendly smile. Karal was the only one of them to acknowledge Filip, and that only with a grunt and a nod.

When the older woman spoke, it seemed like she was picking up the thread of a conversation that had been going on before Filip had taken his seat, but with a studied casualness of someone with an agenda. "Con mis coyo on the *Shinsakuto*, the Ceres fleet's there forever. Earth away from Earth."

"Forever's a long time," Miral said, considering the table like he was reading it. "Can think we know what a year, two years, three years down looks like, aber that's only shit and guessing."

"Can't see the future," the woman said. "Can see what's there now, though, que no?"

Filip took a mouthful of too-salty noodles. He'd waited too long to start eating, and they were more than halfway to paste. The older woman grinned like she'd won a point, leaned in, put her elbows on the table so the split-circle tattoo of the OPA on her wrist showed. Almost like she was displaying it.

"All I'm saying is maybe time we start winning something, yeah? Ceres. Enceladus. Seems like las sola cocks we kick anymore are Michio Pa's, and not so much hers even."

"We beat Earth," Filip said. He'd meant it to seem like an offhand

comment. Something thrown into the conversation almost at random. Instead, he sounded shrill and defensive, even to himself. The words lay there on the table like something broken past fixing. The older woman's smile was thin and nasty. Or maybe he only thought it was. One way or the other, she leaned back, took her elbows off the table. When she stood, when she walked away, it was with the air of having made her point, whatever it had been.

Karal coughed, shook his head. "No te preocupes, Filipino," he said.

"Why would I worry?" Filip asked around another bite of the noodles.

Karal made a circling motion with his hand. *All this and everyone.* "After a fight it's the story about the fight, yeah?"

"Yeah," Filip said. "Bist bien. I understand."

Miral and Karal glanced at each other, and he pretended not to notice. The other crew from the *Koto* kept their silences to themselves. "Hoy, coyo," Miral said, touching Filip's shoulder. "Finish that and come help me with some repair work, yeah? Still tracking down some ganga between the hulls."

Filip pushed the bowl away with his fingertips. "This is done already," he said. "Let's go, us."

The strike that had crippled the *Pella* hadn't been one thing, but a tight cluster of PDC rounds. If they'd hit straight on, it would have been better. The top of the ship above the cockpit and command deck was angled and reinforced against exactly that kind of impact. Maybe it would have peeled back a section of the hull and made a hell of a bang, but kept the guts of the ship safe. The way it had happened—the rounds raking down the side of the ship in a stream—was worse. The housings of the *Pella*'s maneuvering thrusters and PDC cannons, sensor arrays and external antennas had suffered. It was like someone had taken a scraper along all the exposed parts of the ship and taken off whatever could be removed. The damage had left a blind spot in their PDC coverage, but the torpedo that came through it had malfunctioned. If it had detonated, it could have cracked the ship in two, and the old bitch from the galley would have had to hope for the mercy of the inners to keep her leathery ass from drowning in her own waste air.

The torpedo had still hit hard enough to breach the outer hull, though. And the long, tedious work of finding each bit of scrap shaken loose needed to happen. Leaving a handful of metal and ceramic shards to rattle around

between decks whenever they fired the maneuvering thrusters was begging for death. So Filip and Miral suited up, checked each other's seals and bottles and rebreathers, and crawled into the space between the hulls. The Martian designs were elegant and well ordered, everything labeled along with inspection and change-out dates. In the white flare of light from his lamp, Filip considered the bent plate of the outer hull, the jagged gash where the stars showed through. The galactic plane glowed white and gold and rose against the black. It was hard not to stop and stare.

It was different looking at the stars as stars and not dots on a screen. He'd spent his whole life in ships and stations. Seeing the billions of unblinking lights with just his own eyes only happened when he went outside on a repair or an operation. It was always beautiful, sometimes alarming. This time, it seemed almost like a promise. The endless abyss opened around them, a whisper that the universe was larger than his ship. Larger than all the ships put together. Humanity could put its flag on thirteen hundred of those dots and not be a percent of a percent of a percent. That was the empire the inners were fighting and dying to control. A hundred more planets a dozen times over, and less than a rounding error of what was out there staring back at them.

"Hoy, Filipito," Miral said on the suit's private channel. "Come around. Think I've got something."

"Commé. Moment."

Miral was crouched down beside the power conduit for the sensor array. His light was playing over a bit of inner hull. A short, bright line showed where something had scratched it. Miral ran his glove over it, and it smeared. Ceramic, then.

"Okay, you little shit," Filip said, playing his lamp down the conduit. "Where'd you go?"

"Follow on," Miral said, scrambling down the handholds.

When they reached Pallas, the crews could do a more complete inspection. There were tools to blast nitrogen and argon into every crease and curve of the ship and blow out anything stuck there. Better, though, to have as much done before they arrived. And, Filip thought, there weren't any other people out between the hulls. As jobs went, it was the most isolated one that the *Pella* had to offer. All alone, that was reason enough to work it.

Miral's little gasp of victory caught Filip's attention and brought him down close to where the other man was hunched. Miral took a pair of pliers from his belt, applied himself to a section of conduit where the weld had left a gap, then sat back with a grin Filip could see through the suit's helmet mask. The chip was the size of a thumbnail, jagged along one side, smooth on the other.

Filip whistled appreciatively. "Big one."

"Si no?" Miral said. "Leave esá bastard la bouncing around like shooting a gun in here, yeah?"

"One less," Filip said. "Let's see how many more we find."

Miral made a fist and agreed, then tucked the shard into a pocket. "You know, when I was about your age? Drinker back then, me. Spent my time with this coyo always talked about fights he'd been in. Got in them a lot. Liked them, I guess."

"Yeah," Filip said, lowering himself farther down, playing his light across the housing of a maneuvering thruster. He didn't know where Miral was going with this.

"This coyo, he said mostly when things spun up, it was from the other bastard getting embarrassed, sa sa? Maybe didn't want to throw knuckles, but couldn't find a way to push off without his crew seeing him weak."

Filip scowled behind his faceplate. Maybe Miral was talking about what had happened on Ceres? It still bothered Filip sometimes. Not the violence itself, but little flashes of the humiliation left over from realizing the girl he'd been with at the Ceres bar had gone. It wasn't something he wanted to spend more time with. "Que sa, es," he said, hoping that would be enough.

But Miral went on. "Only saying, a man who's feeling like he lost face, yeah? He'll say things he doesn't mean because of it. Do things he doesn't mean."

I meant all what I did, Filip thought but didn't say. *Would mean it again, to do it over.*

But it had the bright, painful feel of touching a fresh scrape, and he'd already come across like a shitty little kid once today. Better to keep his own counsel. And as it turned out, that wasn't what Miral meant at all.

"Your father? He's a good man. Belter to his bones, yeah? It's just this Holden bastard's a sore for him. Getting knocked back, happens a alles one time and another, y alles talk a little bigger afterward. Not a good thing, not

a bad thing. Just the way men get made. Don't take it too close."

Filip paused. Turned back.

"Don't take it too close?" he repeated, making it a question. A demand that Miral say what he meant.

"That," Miral said. "Your dad doesn't mean what he says."

Filip turned his light on Miral, shining it through the older man's faceplate. Miral squinted, put a hand up to shade his eyes.

"What does he say?" Filip asked.

Marco's quarters were past clean to spotless. The walls shone in the light, freshly polished. The dark smudges that always built up beside handholds nearest the door—evidence of the passage of hundreds of hands—had been scraped away. The monitor didn't carry so much as a fleck of lint. Fake sandalwood from the air recycler didn't quite bury the ghost of disinfectant and antifungal wash. Even the gimbals on the crash couch sparkled in the gentle light.

His father, watching the monitor, was also groomed to an eerie perfection. His hair clean and perfectly in place. His beard soft and brown and trimmed so well it seemed almost false. His uniform looked like it had never been worn before. Crisp lines and clean folds. The seams set perfectly, as if by his own precision and the force of his will, he could haul all the rest of the ship up to his standards. Like all the control Marco had spread across the system had been concentrated in one place. Not an atom in the air was out of place.

Rosenfeld was on the monitor. Filip caught the words *other eventualities* before Marco stopped the playback and turned to him.

"Yes?" Marco said. Filip couldn't tell what was in his voice. Calm, yeah. But Marco had a thousand varieties of calm, and not all of them meant things were okay. Filip was too aware that they hadn't really spoken since the battle.

"Was talking to Miral?" Filip said, crossing his arms and leaning against the doorframe. Marco didn't move. Not a nod, not a glance away. His dark eyes left Filip feeling exposed and uncertain, but there wasn't a way to step

back from this. Not without asking. “Said you were telling how what happened was my fault?”

“Because it was.”

The words were simple. Matter-of-fact. There was no heat to them, no sneer or accusation. Filip felt them like a blow to the chest.

“Okay,” he said. “Bien.”

“You were the gunner, and they got away.” Marco spread his arms in a quick, surgical shrug. “Was it a question? Or maybe you’re saying it was *my* fault for thinking you could do it?”

It took Filip an extra try to talk past his throat. “Didn’t drive us into those rounds, me,” he said. “Gunner, me. Not the pilot. And didn’t have a rail gun, yeah? Pinché Holden had a rail gun.”

His father tilted his head to one side. “I just told you that you failed. Now you’re giving me reasons why it’s okay that you failed? Is that how it works?” Filip knew the kind of calm now.

“No,” he said. Then, “No, sir.”

“Good. Bad enough that you fucked it up. Don’t start bawling over it too.”

“Not,” Filip said, but there were tears in his eyes. Shame ran through his blood like bad drugs and left him shaking. “Not bawling, me.”

“Then own it. Say it like a man. Say ‘I fucked it up.’”

I didn’t, Filip thought. *It wasn’t my fault*. “I fucked it up.”

“All right, then,” Marco said. “I’m busy. Close the door when you go.”

“Yeah, okay.”

As Filip turned, Marco shifted back to the monitor. His voice was soft as a sigh. “Crying and excuses are for girls, Filip.”

“Sorry,” Filip said, and pulled the door to behind him.

He walked down the narrow corridor. Voices from the lift. Voices from the galley. Two crews in the space of one, and he couldn’t stand to be near any of them. Not even Miral. Especially not Miral.

He put me up, Filip thought. It was like Miral said. They hadn’t kept hold of Ceres, and then Pa had insulted him by breaking away. This was supposed to be the thing to show the Free Navy couldn’t be fucked with, and all three of their wolves together hadn’t been able to stop the fucking *Rocinante*.

Marco had been humiliated. And shit floated against the spin, that was

all it was. Still, the space below Filip's ribs ached like he'd been punched. It wasn't his fault. It was his fault. He wasn't bawling out excuses. Except that was absolutely what he'd done.

He turned on the light in his cabin. One of the engineering techs was hot-bunking there, blinking up into the light like a baby mouse.

"Que sa?" the man said.

"I'm tired," Filip said.

"Be tired somewhere else," the tech said. "I've got two more hours down."

Filip put his heel against the crash couch and spun it. The tech reached out a hand, stopped it, and unstrapped. "Fine," he said. "You're so fucking tired, sleep then."

The tech took his clothes, muttering under his breath, and left. Filip locked the door behind him and folded himself into the couch, still in his uniform that stank of sweat and the vac-suit seals. The tears tried to come then, but he bit them back, pushed the hurt down into his gut until it settled into something else.

Marco was wrong. His father had embarrassed himself because Holden and Johnson and Naomi got past them. It was like Miral said. Men got like that, and they said things they didn't mean. Did things they wouldn't do if they were thinking straight.

Filip hadn't fucked it up. Marco was wrong, that was all. This time, he just got it wrong.

Words came into his mind, as clear as if they'd been spoken. Though he'd never heard her speak them, they came in his mother's voice. *Wonder what else he got wrong.*

Chapter Thirty-One: Pa

Eugenia was a terrible place to put a base of operations. It was less an asteroid than a complex pile of loose scrap and black gravel traveling in company. Neither the asteroid itself nor the tiny moon that circled it had ever suffered the gravity to press them together or the heat it would take to fuse them. Eugenia and other duniyaret like it offered nothing solid to build on, no internal structure to shore up. Even mining it was hard, the tissue of the asteroid too fast to shift and fall apart. Build a dome there, and the air would seep out through the ground it was built on. Try to spin it up, and it would fly apart. The science station that Earth had built there three generations ago and abandoned was little more than a ruin of sealed concrete and flaking ceramic. A ghost town of the Belt.

The only things it had to recommend it at all were that it wasn't inhabited already and its orbit wasn't too distant from Ceres and the questionable protection of the consolidated fleet. And even that proximity was only temporary. With Ceres' orbital period a couple percent faster than Eugenia's, every day added a little bit to the distance between them, stretching the bubble of safety until it would eventually, inevitably pop. In fairness, if they were still using it to escape the Free Navy when Eugenia and Ceres drifted to the far side of the sun from each other, they'd have bigger problems.

Instead of trying to build on the surface of the asteroid, Michio's little fleet had begun assembling a nakliye port that orbited around Eugenia's main body: shipping containers welded one to another to make passageways, warehouses, airlocks. A tiny reactor was enough to keep the air circulating and enough heat to balance what was lost to radiation. It was temporary by design. Inexpensive, fast to assemble, and made from material so standardized and ubiquitous that a solution discovered once could be applied in a thousand other situations. It grew from a seed of three or four

containers, spreading out, connecting, reinforcing, making distance where distance was needed, bringing together where it was not, spreading like a snowflake the white of rotting sealant.

There were stories of the poorest Belters living in nakliye stations for years, but more often they were used as Michio used them: storage and refueling stations. Floating warehouses without taxes or tariffs to bite into the operating budgets of the prospector. Hyperdistilled water to give pirates reaction mass and potables and oxygen. The older siblings to the scattered supply dumps the Free Navy had consigned to the void. On her monitor, it looked like some ancient sea creature, still experimenting with multiple cells. And beside it, the *Panshin*, compact and sleek.

The ship had matched orbit so precisely it seemed motionless beside the port, as if the two were connected. The flares of working lights and welding torches studded the station's skin, and the spidery shapes of mechs shepherded supplies to it from the *Panshin*. The *Connaught* had shut down its Epstein hours before to keep from slagging the port and the *Panshin* besides, and eased into her own gentle orbit on maneuvering thrusters. The deceleration burn was less like thrust gravity than a suggestion that Michio snuggle into her crash couch.

"They're painting us. Should I acknowledge?" Evans asked.

Everything was a question with him now. Ever since the scare at Ceres Station, his confidence had shattered. It was a problem, but like so many of her problems, she wasn't sure how to fix it. "Please do," she said. "Let them know I'll be coming over."

"Yes, sir," Evans said, turning to his monitor. Michio stretched, forcing her blood along its course. She didn't know why she should feel anxious about seeing Ezio Rodriguez again. She had known him for years, on and off. Another partner in the ongoing struggle to keep the Belt from being used and discarded by the inners and their allies. Only now, he'd taken her side against the Free Navy. This would be the first time she'd breathed his same air since her relief effort had become what it had become. And what did you take to a meeting with a man who'd agreed with you enough to risk his life and the lives of his crew? A thank-you card?

Michio laughed, and Oksana looked over. Michio shook her head. It wouldn't be funny out loud.

"The *Panshin* acknowledges, sir," Evans said. "Captain Rodriguez is on

the port.”

“Then the port it is,” Michio said, unstrapping herself. “Oksana, the ship’s yours.”

“Sir,” Oksana said, but there was a little disappointment in the word. She’d wanted to come along too, but someone had to keep an eye on Evans, and those two had been coming closer of late. Maybe having some time alone with Oksana would put Evans in a place where he could talk about what was bothering him. Better if the impulse came from him. Ordering someone to disclose their private fears wasn’t good leadership. And no matter how much Michio was his wife, she was also his captain.

The *Connaught* came to her place less than a kilometer from the *Panshin* and Eugenia port. That was Oksana showing off a little, but Michio didn’t mind. It made her transit short and easy. The vac suit was Martian, armored but not powered. Well-made, like everything Marco had bartered for. Bertold and Nadia came with, each carrying a sidearm. They passed out of the *Connaught*’s airlock and into the gap, moving slow to conserve fuel and talking about whose turn it was to cook that night while the stars slid between their feet. Michio felt the unexpected tug of happiness. It was amazing to think that people lived their whole lives on a planet’s surface and never had even one moment like this one, the closeness of intimate family and a vastness to rival God in the same breath.

The airlock was set halfway into one of the shipping containers, the walls cutting off the spread of the galaxy before they reached the door. All three cycled in together. As soon as the indicator went green, Michio checked her suit to confirm and then turned off her own oxygen supply and cracked open her seals.

The air inside the port stank of spent oxy-fuel and overheated metal. The percussion of someone’s music carried farther than the rest of the song, making the port throb a little. A steady, mechanical heartbeat. The lights were all unsoftened LEDs, sharp-edged shadows creeping along the ceramic walls as they pulled themselves through the long corridors. Magnetic pallets clung to the surfaces, making no distinction between wall, floor, and ceiling. Old hand terminals had been fixed to each, showing what it contained, where it had come from.

A woman in a transport mech shifted away to the side as they passed, the arms of the mech pulling in close like a spider. She saluted to Michio

and Bertold and Nadia equally, with an air that said she didn't know who they were and didn't care. So long as they were on the same side, they were good with her.

They found Captain Rodriguez in one of the hubs. Nine containers opened their mouths in each of the six directions, fifty-four in all, and were meant to be packed full. Michio could tell at a glance that they weren't. Ezio Rodriguez was a thin-faced man with a trim beard streaked with white, though the rest of his face looked young. He wore his hair cut to the scalp. His suit, like hers, was Martian design. Unlike her, he'd customized it: a starburst blazon on the back between his shoulder blades and the split circle of the OPA as if it were on an armband. Half a dozen other people were moving pallets in the containers around them, shouting to each other through the free air instead of using their radios. Their voices echoed.

"Captain Pa," Rodriguez said. "Bien avisé. Been too long."

"Captain," Michio said. "The *Connaught's* come to relieve you. Take our turn building and standing guard, sa sa?"

"Welcome to it," Rodriguez said, spreading his arms. "Not much, y not nothing."

Each of Michio's little fleet—alone or in pairs—had taken turns building and guarding the port while the others hunted colonists or gathered the supplies scattered into space, dodging Marco's ships while they did it. The *Solano* had taken another of the colony ships—the *Brilliant Iris* out of Luna—and was escorting it toward Ceres to pay their dues to Caesar. Eugenia port was too small to accommodate a ship that large anyway. The *Serrio Mal*, on the other hand, was picking up the dark containers flung off Pallas and Ceres. Those were destined for Eugenia, and from there to wherever they were needed most. Delivering the supplies to Kelso and Iapetus was the most dangerous duty, and Michio reserved it for herself.

Worse than that would be not going.

"Looks thin, que," she said.

"Looks because is," Rodriguez said. "Gathering up's been ralo these last times. Not getting what we were before. Some though."

"Enough?"

Rodriguez laughed like she'd made a joke. "Got something interesting, though. Something for you."

Michio felt the hair at the back of her neck stand up. This felt wrong.

She smiled. "You shouldn't have."

"Couldn't pass it by," Rodriguez said, firing his suit's thruster toward an access way. "Over this way. I'll show."

He didn't tell her to leave Bertold and Nadia, which was good. She wouldn't have. But she didn't know whether to be reassured that he hadn't tried to peel away her guards or frightened that maybe they didn't matter.

"Bertold," she said as they followed the other captain.

"Savvy," he said, his hand on the butt of his gun as if it had only happened to come to rest there. Nadia was the same. They fell into a guarding formation as naturally as blinking. When Rodriguez reached the walls of the port, he landed with a clank, turning on his mag boot and killing his momentum with his knees. The music they'd heard before was gone now, and Rodriguez looked behind them, as if making sure they weren't followed. Or else that they were.

"Making me nervous, coyo," Michio said, walking after him. "Something you want to say?"

"Bon sí, aber not here," Rodriguez said, the lightness gone from his voice and a grim tension in its place. "Smuggled past the smugglers, this one."

"Not feeling better."

"You will or you won't. Come alles la."

The container he took them to had a little office built out from the side. Scrapwelded together with its own airlock. Rodriguez keyed in a passcode by hand. Bertold stretched his arms, blew out his breath, like a weight lifter about to try more than his usual load.

"Love you," Nadia said, her voice calm and conversational as if she wasn't saying it in case they were her last words.

The airlock opened, and a man popped out. Thin frame, dark hair in curls. "Is she here?" he said, and then, "Oh. There you are."

A shock of surprise, the uncertainty of whether this was a threat or something more interesting. "Sanjrani."

"Nico, Nico, Nico," Rodriguez said, pushing Sanjrani back through the airlock. "Not here. Didn't sneak through te ass end of nothing to wave you like a flag. Get back safe in." When Sanjrani had retreated, Rodriguez turned to Michio, motioning that she should follow. When she hesitated, he lifted his arm to his sides, cruciform. "Got no guns, me. Esá goes bad, la

dué la can shoot me.”

“Can,” Bertold agreed. His sidearm was drawn, but not pointed. Not yet.

“All right, then,” Michio said, clomping forward in her boots, the magnets dragging her down against the floors, holding her, and letting her go again with every step.

In the little office, Sanjrani sat strapped onto a stool before a thin desk. Another waited across from him. She didn’t see a trap. Didn’t know what she was looking at. “Are you looking to change sides?” she asked.

Sanjrani made a deep, impatient cough. “I’m here to tell you why you’re killing everyone in the fucking Belt. You and Marco both. You two should be on *my* side.”

“Does he know you’re here?”

“Am I dead already? No, he doesn’t. That’s how desperate I’ve gotten. I try to talk to Rosenfeld, but he’s only talking to Marco. No one knows where Dawes got to. They won’t *listen*.” There was a desperation in his voice, high and thin as a bow against a string.

“All right,” she said, moving to the stool, pulling the belt across her lap. “I’ll listen.”

Sanjrani relaxed and pulled up a diagram from the desk’s display. A complex series of curves laid over x and y axes. “We made assumptions when we started this,” he said. “We made plans. Good ones, I think. But we didn’t follow them.”

“Dui,” Michio said.

“First thing we did,” he said, “was destroy the biggest source of wealth and complex organics in the system. The only supply of complex organics that work with our metabolisms. The worlds on the other side of the ring? Different genetic codes. Different chemistries. *Not* something we can import and eat. But that was okay. Projections were clear. We could build a new economy, put together infrastructure, make a sustainable network of microecologies in a cooperative-competitive matrix. Base the currencies on —”

“Nico,” she said.

“Right. Right. We needed to start building it all as soon as the rocks fell.”

“I know,” she said.

“You don’t,” he said. Tears sheeted across his eyes, clung to his skin.

“No recycling process is perfect. Everything degrades. The colony ships? The supplies? They’re all stopgap. They’re the measure of how long we have to make a living Belt. Look here. This green curve is the projected output of the new economic models. The ones we’re not doing, yeah? And this”—he pointed to a descending red curve—“is the best case of how long the conscripted supplies will last. Equilibrium is here. Five years out.”

“All right.”

“And this line here, the base we would need between them to keep the present population of the Belt alive.”

“We stay above it.”

“We would have,” Sanjrani said, “if we’d kept to the plan. Here’s where we are now.”

He shifted the green line. Michio felt her throat tighten as she understood what she was looking at.

“We’re fine now,” Sanjrani said. “We’ll be fine for three years. Maybe three and a half. Then the recycling systems stop being able to meet demand. We won’t have infrastructure in place to fill the gaps. And then we’ll starve. Not just Earth. Not just Mars. The Belt too. And once we start, we’ll have no way to stop.”

“All right,” Michio said. “How do we fix it?”

“I don’t know,” Sanjrani said.

The *Panshin* left a day later, taking Sanjrani and what little remained of Michio’s peace of mind with it. Her crew did their part, building out the port, ringing the new wires. Messages seeped into the *Connaught*’s antennas, some of them for her. Iapetus needed more food-grade magnesium. A collection of prospecting ships had exhausted their filters and needed replacements. The Free Navy poured out what they called news, some of it about how much Belter material she’d given over to the enemy.

Whenever she tried to sleep, the sense of dread welled up in her heart. When the hard times came, when the starving began, it would come like a ratchet. It was hard to make a new, shining city in the void when the people designing it, building it, living in it were dying from want. When they were

dying because she and Marco were at each other's throats instead of following the plan.

She had to remind herself that she hadn't been the one to change things. Marco had gone off script before her. She'd made her break because he had. She was trying to help. Only when she closed her eyes, she saw the red line sloping down toward nothing, and no upward green swoop to answer it. Three years. Maybe three and a half. But to make it work, they had to start now. Had to have started already.

Or they had to make a very new plan, and neither she nor Sanjrani knew what that was.

The others avoided her, giving her food and water and space to think. She woke alone, worked her shift, slept alone, and didn't feel the loss of company. And so she was surprised when Laura came to find her in the gym.

"Message came for you, Captain," she said. Not Michi, but Captain. So Laura was not her wife then, but her comm officer on duty.

Michio let the tension bands slide back into their housings and wicked the sweat off her skin with a towel. "What is it?"

"Tightbeam relayed through Ceres," Laura said. "It's from the *Rocinante* en route to Tycho Station. It's flagged captain-to-captain."

Michio considered telling Laura to play it. That they were family, and didn't have any secrets. It was a dangerous impulse. She stifled it.

"I'll take it in my quarters," she said.

When she opened the message, James Holden looked out from the screen. Her first thought was that he looked like crap. Her second thought was that she probably did too. She tucked her sweat-damp towel into the recycler. *No recycling process is perfect*. She shuddered, but Holden had started talking.

"Captain Pa," he said. "I hope this gets to you quickly. And that everything's all right with your ship and your crew and ... Well. Anyway. I'm in kind of a weird situation, and to be honest, I was hoping I could ask you for a favor."

He tried a smile, but his eyes looked haunted.

"I'll tell you the truth," he said. "*I'm kind of desperate here.*"

Chapter Thirty-Two: Vandercaust

When the guards got bored kicking him, they rolled Vandercaust into the cell and sealed the door.

He lay in the dark for some stretch of time—five minutes, an hour. Not more than that. When he sat up, his ribs and back ached, but not with the deepness or grinding sensation that broken bones carried. The only light was a single recessed LED at the joint where the back wall and ceiling met. Its dimness stole the color from everything, so the little streaks of blood on his shirt only looked black.

With nothing better to do, he took a slow inventory of his body: bruised ribs and cheek, swollen eye, abrasions at his wrists where they'd cuffed him. Nothing bad, really. He'd suffered worse, and sometimes at the hands of his friends. Wasn't like this was the first time he'd been arrested. Not even the first time he'd been arrested for something he didn't do. It had always been inners that did it before, though.

The more it changes, the more it's still the same, he thought. He found a comfortable spot in the corner where he could rest his head, close his eyes, and see if the anxiety was enough to keep him awake. It was, mostly, but he did manage a little doze before the door broke seal and swung open. Two guards in armor and sidearms. A higher-up in armor too. All Free Navy colors.

Probably that was good. People didn't generally dress up for a murder.

"Emil Jacquard Vandercaust?"

"Aquí," he said.

The higher-up was a thick-faced boy with a brown complexion that matched his eyes. Handsome, in his way, but too young for Vandercaust's tastes. He'd come to an age when sex was less about who he fell into bed with and more about who he woke up next to, and the set of people he considered children extended to include men in their early thirties. The

pretty child scowled, maybe at Vandercaust and maybe at how he'd been treated. For a moment, the silence in the room made him wonder if they'd leave again. Lock the door and stick him in the dark. The idea made him aware of his thirst.

"Agua, yeah?"

"Commst," the boy said. Vandercaust levered himself up to his feet, his abused muscles shrieking, but not badly enough to stop him. The guards fell in, one ahead and one behind, and the boy leading them all like a sad little parade. The room they took him to was brighter, more comfortable, though not by much. A low metal stool was welded to the deck, short enough that sitting on it made Vandercaust feel like he was in some school for children, expected to take a desk meant for a six-year-old. He'd been questioned by security enough in his life to recognize the little humiliation as the tactic it was. A guard brought him half a bulb of tepid water, watched him drink it, and took it back.

The guards stepped out, the door closing behind them. The boy stood at a desk, looking down at him through a floating display. Seeing the display from behind was like seeing someone through a bright mist.

Vandercaust waited. The boy took a flat yellow lozenge out of his pocket. Focus drugs, or what Vandercaust was supposed to assume were. The boy put the lozenge under his tongue, sucked thoughtfully for a moment. Shuddered.

"You missed the battle alert yesterday," he said.

"I did."

"Can you explain that?"

Vandercaust shrugged. "Deep sleeper when I'm drunk, me. Didn't hear it. No se savvy what happened before it was over, yeah?"

"Savvy tú now?"

"Heard some things, yeah."

"Let's go over what you heard, then."

Vandercaust nodded, as much to himself as to the boy. Time to pick his handholds careful. Whatever they were spun up over, this was the time he'd land in it if he spoke the wrong words.

"Was a bunch of ships came from the colonies, what I heard. Fourteen, fifteen ships all through rings at the same time. Fast too. Trying to get to Medina before the rail guns took them out, yeah? Only didn't so much.

What the guns didn't put holes in, station defenses took out. Some debris hits on the drum hull, aber nothing can't be fixed."

The boy nodded, made some notation in the bright air between them. "Fourteen or fifteen?"

"Yeah."

The boy's eyes hardened. "Was it fourteen you heard, or fifteen?"

Vandercaust frowned. There was something about the boy's reaction that didn't sit right. If they'd been playing poker, he'd wait to see if the boy's hand was particularly strong or weak, then spend the rest of the night cleaning him out over that hardness. Only there weren't any cards to come down here.

"Heard fourteen or fifteen. A phrase. Eight or ten. Six or seven. Didn't hear a number."

"What rings did they come through?"

"Don't know."

"Look at me," the boy said. Vandercaust looked up into the boy's light-brown eyes. "What rings did they go through?"

"No savvy. I don't know."

The boy's eyes flickered, looked away. Vandercaust scratched his arm even though it didn't itch. Just to be doing something.

"They all came through within fifteen seconds of each other," the boy said. "And they *were* going fast. Any thoughts about that, Mister Vandercaust?"

"Coordinated," he said. "Sounds like they been talking con alles, sa sa? Making plans."

Which—ah, yes—meant they'd found some way to break lightspeed, bend time, and locate each other in the vastness of the galaxy, or else that conversation had been passing through the rings. Through Medina. It meant somewhere on Medina Station, somebody had been working against the Free Navy. He'd known that the arrest couldn't just be for missing an emergency shift. Now it came a little clearer what the boy was looking for. Watched the boy watch him understand.

"Who told you about the attack?"

"Heard about it in my workgroup. Jakulski. Salis. Roberts. Just chap-chap over coffee, yeah?"

Another notation made. "Anything you think of I should know about

them?”

A coldness that had nothing to do with the temperature ran up Vandercaust's back, lifted his skin in bumps. Maybe it wasn't only that he'd slept through the alarm. He'd been drunk. Drunk men could sleep through anything. But if he hadn't made the call *and* he was near to someone with something worth hiding ...

Salis had friends in communication. Bragged about them all the time, how he knew what was going on with Duarte and Inaros, what kinds of barks and whines were floating through the rings. Someone was coordinating an attack on Medina, wouldn't they be in communications? Have to be, ne? And Roberts talking about Callisto and proxy wars. How Duarte's people were maybe using them against Earth and Mars, about how much she hated being caught between the powers like that. She'd been the first one Vandercaust knew to squint hard at the advisors from Laconia setting up defenses on the alien station where rail gun housings were. Possible that she'd work with the colonies if it meant shrugging off Laconia and keeping Medina independent. And hadn't Jakulski been at the greeting when the advisors came? He said it had been as a favor to one of the other supervisors, but what if he'd been engineering a chance to put eyes on the enemy?

Thousands of people on Medina, living and working. All of them Belters, more or less. Most of them OPA before and Free Navy now. But there were some that hadn't known what was coming. Maybe some with family still on Earth, dying under the rockfalls. He didn't know anything about Jakulski's mother, Salis' siblings, Roberts' old lovers. Any of them could just be acting like Free Navy because it was asking for hell to be anything else.

The boy cocked his head, sucked at the focus drugs. Vandercaust laced his fingers together and forced out a little laugh. “Easy to see how a coyo could get paranoid.”

“Why don't we go over this from the start?” the boy said.

It went on for hours, it felt like. No hand terminal. No screens that he could see. All Vandercaust had to judge by was the animal rhythms of his body. How long it was before he got thirsty again. Hungry. When he started feeling sleepy. When he needed to visit the head. He walked the boy through his whole night before the attack. Where he'd been. Who else had

been there. What he'd drunk. How he'd gotten back to his quarters. Over and over, pushing at anything he said a little different from another time, pushing him to remember things he didn't really remember and then coming at him when he got some detail wrong. The boy asked about Roberts, Salis, Jakulski. He asked about who else Vandercaust knew on Medina. Who he knew on the Sol side of the ring. What he knew about Michio Pa and Susanna Foyle and Ezio Rodriguez. When he'd been at Tycho Station. At Ceres. At Rhea. At Ganymede.

They showed him images of the attacks. The ships emerging through the gates all around the great sphere of gates. He watched them die as tactical images. As telescopic records of real people, really dying. Then they talked more, and showed it all to him again. He had a sense that the readouts were subtly different the second time out—another attempt to catch him out on something—but he couldn't say what the changes were.

It was exhausting. It was meant to be exhausting. After a while, he stopped trying to keep his answers safe. He'd known enough about interrogation to see that this—wearying and harsh and dull though it was—was on the gentler end of that spectrum. He had no reason to protect his friends beyond the vague tribalism of being on a workgroup with them. If they were innocent, the truth would have to be armor enough. For them, and for him too.

They took him back to his cell. No beating this time. Just a hard shove through the door that left him sprawling and knocked his cheek against the wall hard enough to split it. He slept for a while, woke in darkness, slept again. The second time he woke, there was a bowl of beans and mushrooms congealing beside the door. He ate them anyway. No way to know how long he'd be there. How long it would all go on. Whether it would get worse.

When the door opened again, five people in Free Navy uniforms came in. The brown-eyed boy wasn't among them, and for a moment, that made Vandercaust very nervous. Like looking for a friend and not finding them. The leader of the new group was laughing with one of her subordinates, checked her hand terminal by holding it up beside his face without paying much attention to him, tapped her screen.

"You should go, pampaw," she said, walking out. "Late for your shift, you."

They left the door open behind them, and after a moment, Vandercaust

walked out of the cell, out of the security station, into the wide corridors of the drum. His body felt like a rag used for too long. He was certain that he smelled like sick primate and old sweat. The guard had been right. It was almost time for his shift, but he still went back to his hole, showered, shaved, changed into new clothes. He spent a few long minutes admiring the bruises on his face and sides. On a younger man, they could have been badges of endurance. On him, they just looked like an old man who'd caught the toes of a few too many boots. So he was late. He had reason to be. Little rebel, him.

He found Salis and Roberts deep in the service passageways, testing flow on the sewage intake for the backup recycling plant. Roberts' eyes lit up as he approached, and she threw her arms around him.

"Perdíd," she breathed against his ear. "Are you okay? We were worried."

"Es dui?" Salis said, reaching across the table for the wasabi-flavored soy nuts. "They beat you up à nothing?"

The shift done, the three had retired to their usual bar. The breeze from spinward was as it always was. The thin line of sunlight stretched above them. Vandercaust pushed the bowl toward Salis' fingers. "Security is police, and police are the same everywhere."

"Still," Roberts said. "Why bother pushing off the inners if it's just to have a Belter foot stepping on our necks instead?"

"Wouldn't talk like that," Vandercaust said, then drank. Water tonight. Might be some time before he went for a long, solid drunk again. "Anxious times, these."

"Talk how I want to talk," Roberts said, but softly. She turned to her hand terminal. He could see the green and silver of the station feed, same colors it had been before the Free Navy took over. He wondered why they hadn't changed it. A way to give a sense of continuity, maybe. Anything on the feed would have been vetted, of course. The power of Medina Station was that it was so much not a part of any of the systems on the far sides of the gate. The price of it was that information came from a single source.

Back in Sol system, there would be any number of feeds and subfeeds. Some broadcast, some left in storage to be queried and mirrored. Hard to control what got out. Maybe impossible. Medina, one set of jammers blocked every unlicensed receiver and transmitter at once.

The server came with his gyro—textured fungus and soybean curd instead of lamb and beef. Cucumber yogurt. A sprig of mint. He reached out for it with a little grunt and a sudden ache. It wasn't the worst beating he'd ever suffered, but he'd still be sore for days.

"Why they set you out?" Salis asked. "Sprecht el la?"

"No, they didn't say," Vandercaust replied. "Or that they wouldn't be back. Maybe they just needed someone to keep you two on schedule."

He'd missed two full shifts and come in during the middle of the third. Three days, almost, lost in the darkness of the security cell. No lawyer, no union representative. He could have asked for one—should have, by the rules and customs—but the certainty was solid as steel that it would have only meant more bruises. Maybe a broken bone. Vandercaust knew enough of history and human nature to know when the rules weren't the rules anymore. He took a bite of his sandwich, then put it down while he chewed. After this, he'd go home. Sleep in his own bed. Sounded like the promise of paradise. He traced fingertips over the split circle on his wrist. It had been a statement of rebellion once. Now, maybe it only made him seem old. Still taking sides in the last generation's fight.

"My friend in comms?" Salis said. "You know what they say? Found a hidden dump in the data core. Walled off. Think it was what they used to coordinate with the colonies. Confirmations came in from all the gates just before the attack hit. Only funny thing? Two ships didn't come through."

Salis cranked his eyebrows up toward his hairline.

Vandercaust grunted. "Were asking me about how many ships came through. Like they wanted a number."

"Probably why. See if you knew how many came through or how many were supposed to, yeah? Trip you up if you were in on."

"But didn't have nothing," Vandercaust said, tapping his forehead with two fingers. "Bon besse for me."

Salis put a hand on his arm. The young man looked pained. Aching, but not in the muscles and joints. Not the way he was. "You should let me buy you a drink, coyo. You had a shit week."

Vandercaust shrugged. He didn't know how to explain himself to Salis or Roberts. They were young. They hadn't seen the things he'd seen. Hadn't done the thing he'd done. Being picked up by security, locked away, beaten, interrogated. They didn't scare him in themselves. They scared him for what they said about how it came next. They scared him because they meant that Medina Station wasn't a new beginning in history. It was and would be as red in the gutter as everywhere else humanity had set its flags.

Roberts sat up, her eyes going wide. "They got!"

Salis let his hand drop, turned to her. "Que?"

"The mole? The coordinator. They got."

She turned her hand terminal toward them. On it, station security in Free Navy uniforms were walking, eight of them, around a broad-shouldered, squat man with dark hair and a scruff of beard. Vandercaust thought he looked familiar, but couldn't place him. The image jumped to Captain Samuels, with Jon Amash standing behind her on one side. Political power and security service, one beside the other, and no light between them.

Samuels' lips began to move.

"Turn it up," Salis said. Roberts fumbled with her terminal, then shifted around between them so they could all see the screen.

"—ties not only to the settlements that chose aggression against us but also with regressive forces back in Sol system. He will be questioned fully before execution. While we have to keep eyes open and alert, I am convinced, given all I have seen, that the immediate threat to Medina Station is under control."

"Execution," Roberts said.

Salis shrugged. "You put the ship at risk, that's what happens. Those colony bastards weren't coming to play dice and make happy."

"Least it's over," Vandercaust said.

"Is why they let you go," Roberts said, shaking her hand terminal. "Found him. Saw you weren't involved."

Or picked someone to play the goat, Vandercaust thought. *Only I got lucky enough it wasn't me.* It wasn't the sort of thing you said out loud. Not at times like these.

Chapter Thirty-Three: Holden

The room they were using as an anteroom was larger than the *Rocinante*'s galley. Wide tables with built-in monitors and tall metal stools. Soft, indirect lighting in a manipulated spectrum that reminded Holden of early mornings in his childhood. He didn't have a rank or a uniform, but the ship jumpsuit had seemed wrong for the occasion. He'd decided on a dark, collarless shirt and pants that echoed the sense of a military uniform without making any specific claims.

Naomi, pacing now along the wall by the yellow double doors, had matched him, but he had the creeping sense that they looked better on her. So of the three of them, only Bobbie was in uniform, and hers had the insignia left off. The cut and the fitting all screamed Martian Marine Corps. And the people they were going to meet with—the ones gathering right now down the hall—knew who she was anyway.

"You keep pulling at that sleeve," Bobbie said. "It bothering you?"

"It? No, *it's* fine," Holden said. "I'm bothering me. Do you know how many times I've done this kind of diplomatic work? I've been in battles and I've put together video feeds, but to walk in, look down the table at a bunch of OPA operatives, and tell them how they all need to listen to me? I've done that exactly no times. Never."

"Ilus," Naomi said.

"You mean when that one guy killed the other guy in the street and then burned a bunch of people alive?"

Naomi sighed. "Yeah. Then."

Bobbie flexed her hands, put them palm down on the table display. The monitor glowed for a moment, waiting for a command, then dimmed again when nothing came. Muffled voices came through the doorway. A woman with a Belter's accent asking something about chairs. A man replying, his voice too low to make out. "I've been in rooms like this before," Bobbie

said. “Political work. A lot of different agendas and no one saying out loud what they were actually thinking.”

“Yeah?” Holden said.

“It sucked.”

The *Rocinante* had decelerated toward Tycho harder than they’d planned, burning off the speed they’d poured on during the battle and pressing them all down a little more than usual, like an illness or a regret. Holden held a little ceremony in the galley where each of them shared some memory of Fred Johnson and they let their various griefs blur together. The only ones not to speak were Amos, smiling his amiable and meaningless smile, and Clarissa, her brow furrowed in concentration like it was all a puzzle she was trying to solve.

When they broke up, Holden noticed that Alex and Sandra Ip went off together, but he didn’t have time or enough moral high ground to worry about fraternization. Every hour that passed had taken them a few thousand clicks closer to Tycho and the meeting there. All of his spare time was in his cabin with the door closed trading messages across the emptiness of the system. Michio Pa. Drummer on Tycho. A man named Damian Short, who’d taken the reins on Ceres. But mostly Chrisjen Avasarala.

Every long, heavy day, he traded messages with Luna. Long lectures from Avasarala on how to conduct a meeting, how to present himself and his arguments. More importantly, how to listen to what the others said and didn’t say. She sent him dossiers on all the major OPA players who would be there: Aimee Ostman, Micah al-Dujaili, Liang Goodfortune, Carlos Walker. Everything Avasarala knew about them—who their families were, what their factions within the OPA had done and what she only suspected they’d done. The depth of background was overwhelming, group loyalties intersecting and drawing apart, personal insults affecting political agreements, and political agreements shaping relationships. And along with it, Avasarala pouring the distilled insights of a lifetime of political life into his ears until he was drunk with it to the edge of nausea.

Strength by itself is just bullying, capitulation by itself is an invitation to

get fucked; only mixed strategies survive. Everything is personal, but they know that too. They can smell pandering like a fart. If you treat them like they're a treasure box where if you just tweak them the right way, the policy you want falls out, you're already fucked. They'll misjudge you, so be ready to use that.

By the time he walked into the meeting room on Tycho, he intended to have a little, simplified version of Avasarala that lived in the back of his mind. It felt like doing a decade of work in a few days because it sort of was. He got to where he couldn't sleep and he couldn't stay awake. When they finally reached Tycho Station, it was hard to say whether the dread was more powerful or the relief.

Walking the habitation ring of Tycho the first time after their return had been eerie. Everything was perfectly familiar—the pale foam of the walls, the slightly astringent smell in the air, the sound of bhangra music leaking from some distant workroom—but it all meant something different now. Tycho was Fred Johnson's house, only now it wasn't. Holden kept having the nagging sense that someone was missing, and then remembering who it was.

Drummer had done her mourning in private. When she escorted them in, she was the head of security that she'd been before: sharp and aware and businesslike. She'd met them at the docks with a convoy of carts, each one with a pair of armed guards. That didn't make Holden feel better.

"So who's in charge here now?" he'd asked as they paused at the bulkhead that marked the administrative section.

"Technically, Bredon Tycho and the board of directors," she said. "Except they're mostly on Earth or Luna. Never been out here. Always pleased to keep their hands clean. We're here, so until someone comes and makes a strong opposing case, we run it."

"We?"

Drummer nodded. Her eyes got a little harder, and he couldn't say if it was grief in them or anger. "Johnson wanted me to keep an eye on the place until he got back. That's what I plan to do."

There were supposed to be four people waiting for him.

There were five.

He recognized all the faces that Avasarala had prepared him for. Carlos Walker, wide shoulders and face, even shorter than Clarissa, had an uncanny air of stillness. Aimee Ostman could have passed for a middle-grade science teacher, but was responsible for more attacks against inner-planet military targets than all the rest combined. Liang Goodfortune, who Fred had only managed to lure to the table by offering amnesty for their daughter, a former OPA hitter still housed in a numbers-only prison on Luna. Micah al-Dujaili, with his fat, red-veined drunkard's nose, who'd spent half his lifetime coordinating free schools and medical clinics throughout the Belt. Whose brother had been captain of the *Witch of Endor* when the Free Navy destroyed it.

The fifth person had the white hair of an old man, pocked cheeks, and a deferential smile that was almost an apology, but not quite. Holden recognized him, but wasn't sure from where. He tried to keep his poker face, but the fifth man saw through the effort without seeming to realize it was there.

"Anderson Dawes," the man said. "I don't think we've ever met person to person, but Fred talked about you often. And, of course, your reputation."

Holden shook hands with the former governor of Ceres Station and master of Marco Inaros' inner circle, his mind racing. "I was wondering if you'd be here," he lied.

"I hadn't announced myself," Dawes said. "Tycho's a risky place for a man in my position. I was relying on Fred to vouch for me. We worked together for many years. I was sorry to hear about him."

"It's a loss," Holden said. "Fred was a good man. I'll miss him."

"As will we all," Dawes said. "I hope you don't mind my arriving unannounced. Aimee reached out to me when she knew she was coming, and I asked her to let me follow along."

Good, great, the more the merrier, Holden thought, but the little version of Avasarala in his imagination frowned. "I'm glad you're here, but you can't be in this meeting."

"I can vouch for him," Aimee Ostman said.

Holden nodded, tried to imagine what Avasarala would say, but it was the old, almost-forgotten voice of Miller that came to him. "There's a way

we do things. This isn't it. I hope you don't mind waiting outside, Mr. Dawes. Naomi, could you see that our friend here finds someplace comfortable?"

Naomi stepped forward. Dawes shifted his weight to the back of his feet, surprised. *This is your house*, Avasarala said in Holden's mind. *If they don't respect you here, they won't respect you anywhere*. Dawes gathered up his hand terminal and a white ceramic cup, nodding to Holden with a tight smile as he left. Holden took his seat, grateful for the solid and looming presence of Bobbie at his side. Aimee Ostman's lips were pressed thin. *If you're looking for mutual respect, you can start by asking before you invite people to my secret meetings*. It seemed like a rude thing to say out loud.

"If you're looking for mutual respect, you can start by asking before you invite people to my secret meetings."

Aimee Ostman cleared her throat and looked away.

"All right," Holden said. "This was supposed to be Fred Johnson's presentation, but he's gone. I know you all came here on the strength of his word and his reputation. And I know you're all concerned about Marco Inaros and the Free Navy. But I also know this is the first time any of you have met me, and I may not have your full confidence."

"You're James Holden," Liang Goodfortune said in a tone that meant *Of course you don't have our full confidence*.

"I took the liberty of arranging an introduction," he said, shifting the message from his hand terminal to the monitors on the table.

Michio Pa looked out at each of them. The command deck of the *Connaught* glowed behind her. "Friends," she said. "As you know, I was not long ago in the inner circle of the Free Navy, and what I saw there convinced me and many of those in my command that Marco Inaros is not the leader that the Belt needs. As the Free Navy has abandoned its original purpose of supporting and rebuilding the Belt and keeping the industry that feeds Belters from shifting out to the new colony worlds, I have stayed true. You all know this. I have lost friends to this effort. I have risked my life and the lives of those I care most deeply for. I serve with the true heroes of the Belt. My credentials are beyond reproach."

Bobbie nudged him and nodded toward Micah al-Dujaili. Tears were shining in the man's eyes. Holden nodded. He saw it too.

"Since my parting of ways with the Free Navy, I have been working

with Fred Johnson toward a comprehensive plan that will guarantee the safety and well-being of the Belt.” Pa paused, took a deep breath. Holden wondered whether she did that every time she lied, or just when it was a whopper. “This meeting was intended to be an introduction of that plan and of Captain Holden as integral to it. Unfortunately, while Fred Johnson was able to see the path forward, he isn’t able to make that journey with us. As a dedicated citizen of the Belt and a servant of our people, I’m asking you to hear Captain Holden out and then to join with us for a living future. Thank you.”

Everything about her statement had been negotiated. He’d lost track of the number of times they’d traded back and forth, Pa asking for something, Avasarala explaining what it really meant, him running between the two of them like a messenger, but learning a little more with every pass. Pa would agree to say they’d been working toward a plan, but not that they’d been working on a plan. She would say that Holden was integral to it, but not that he was central. The whole process had been everything he hated—niggling on details and nuances, fighting over turns of phrase and the order information was presented in, fashioning something that, even where it wasn’t outright false, was tailored to be misunderstood. Politics at its most political.

He looked at the four faces sitting around the table and tried to judge whether it had worked. Aimee Ostman looked thoughtful and sour. Micah al-Dujaili was still composing himself, moved by the reminder that his brother had already sacrificed himself in the cause. Carlos Walker, still and silent and unreadable as language in an unknown alphabet. Liang Goodfortune cleared their throat.

“Looks like Inaros has a habit of losing women to you, Captain,” Goodfortune said. Walker chuckled. *They’ll try embarrassing you a little to see how you react. Don’t try to one-up them, or they’ll try to escalate out of conflicts later. Stay on point.* Naomi stepped back in, came to sit at his side.

“Losing Fred is hard because it’s sad,” Holden said. “He was a friend. But it doesn’t change the situation. He formed a plan, and my intention is to follow it. Fred called on each of you because he felt you had something to offer this and also something to gain by it.”

Carlos Walker’s eyes shifted, as if he’d heard something interesting for the first time. Holden nodded to him, an intentionally ambiguous gesture.

Then he turned to Bobbie. Her turn to take the floor.

“There will be a military aspect to this,” she said. “We’re not getting through any of this without some risk, but we’re confident that it is more than outweighed by the rewards.”

“You say that as a representative of Mars?” Aimee Ostman asked.

“Sergeant Draper has worked as a liaison between Earth and Mars on several occasions,” Holden said. “She’s here today as a member of my crew.”

That was odd. Bobbie seemed to grow tenser at the words, gather herself, sit up straighter. When she spoke again, her tone was almost exactly the same as it had been before—no louder, no rougher—but something about it had grown fierce. “I have experience in combat. I’ve led teams in battle. It is my professional opinion that the proposal Fred Johnson put together is the best hope for the long-term stability and safety of the Belt.”

“Find that hard to believe,” Aimee Ostman said. “Looks to me like the captain here’s been getting all the women and Inaros has been taking all the stations.”

Before Holden could answer, Micah al-Dujaili snapped back. “Looks to me like Inaros is as bad at keeping territory as he is at keeping women.”

“Stop it with the ‘women’ bullshit,” Carlos Walker said. His voice was surprising. Reedy and musical. A singer’s voice. The accents of Belter cant were almost absent from it. “It’s juvenile. He lost Dawes too. He lost everyone in this room before he even began, or none of us would be here. Inaros has an open sore where his heart should be, and we all know it. What I want to hear is how you intend to change the dynamic. Every time you move toward him, he’s pulled you into overreach. Your consolidated fleet is going to be stretched too thin soon. Is that what you want us for? Cannon fodder?”

“I’m not ready to discuss the details,” Holden said. “There are security issues we all have to address first.”

“Why did you bring us here if it wasn’t to tell us what you intended?” Aimee Ostman said.

Liang Goodfortune ignored her. “Medina. You’re going for Medina.”

Something will go wrong. Something always does. They’ll see something you didn’t mean them to see; they’ll have a trap set you didn’t know to expect. These are intelligent people, and all of them have their own

agendas. When it happens—not if, when—the worst thing you can do is panic. The second worst thing you can do is engage. Holden leaned forward.

“I’d like to give all of you the opportunity to consult about this before we talk about any of the tactical options,” Holden said. “I’ve spoken to the security chief. You are all welcome to stay here on the station or else return to your ships. Feel free to talk among yourselves or with anyone you think might be useful. You can have access to the station comms unmonitored, or if you’d rather use the systems on your own ships, you won’t be recorded or jammed. If you are interested in being involved with this, we’ll reconvene here in twenty hours. I’ll be ready to go through all the details then, but I will expect your loyalty and commitment in return. If you aren’t comfortable with that, you have safe passage away from Tycho anytime within that window.”

“And after that?” Carlos Walker asked.

“After that’s a different country,” Holden said. “We’ll be doing things differently there.”

Holden, Naomi, and Bobbie all stood. The other four rose a moment later. Holden watched how each of them said their goodbyes or else didn’t. When the doors closed behind the four emissaries, leaving him alone with Naomi and Bobbie, he slumped down in his chair.

“God *damn*,” he said. “How does she do this all day, every day? That was maybe twenty minutes start to finish, and I already feel like I should dip my brain in bleach.”

“Told you it sucked,” Bobbie said, leaning against the table. “Are you sure it’s a good idea giving them free rein of the station? We don’t know who they’re talking to.”

“We couldn’t stop them,” Naomi said. “This way it looks like a gesture on our part.”

“So theater and palace intrigue,” Bobbie said.

“Just for now,” Holden said. “Just until they buy in. Once they commit, we can get down to our plan.”

“Johnson’s plan,” Bobbie said. Then a moment later, “So, just between us. Did Fred Johnson really have a plan?”

“I’m pretty sure he did,” Holden said, sagging into himself. “Don’t know what it was.”

“So this one we’re selling?”

“I’m kind of making it up.”

Chapter Thirty-Four: Dawes

There was no viewing of the body. Fred Johnson—the Butcher of Anderson Station—had requested that his body be recycled into the system of Tycho Station. Water that had been his blood was likely already coming through the taps and faucets throughout the station. His chalk bones would reenter the food cycle in the hydroponics pools. The more complex lipids and proteins would take longer to become humus for the mushroom farms. Fred Johnson, like all the dead before him, fell to his component parts, scattered, and entered the world again, changed and unrecognized.

Instead, there were printed images of him on the chapel wall. A portrait of the man as a colonel in the service of Earth. A picture of him as an older man, still strong in his features but with a weariness creeping in at his eyes. Another of a ridiculously young boy—not more than ten years old—holding a book in one hand and waving with the other, his face split by a massive and childlike grin. They were the right ears, the right spacing of the eyes, but Dawes still had to work to believe that happy child had grown into the complex man he'd known and called friend and betrayed.

The memorial was in a small chapel so aggressively nondenominational that it was hard to tell the difference between it and a waiting room. Instead of religious icons, there were sober, abstract shapes. A circle in gold, a square in forest green. Intentionally empty symbols meant as placeholders for where something with significance might have been. The Tycho Manufacturing logo in the hallway outside held more meaning.

The pews were bamboo textured to look like some sort of wood—ash or oak or pine. Dawes had only ever seen pictures of live trees. He wouldn't have known one from another, but it gave the little room some sense of gravitas. Still he didn't sit. He walked past the pictures of Fred Johnson, looking into the eyes that didn't look back. The thing in his chest, the one making it hard to breathe, felt thick and complicated.

“I had a speech ready,” he said. His voice echoed a little, the emptiness giving it depth. “Well practiced. You’d have liked it. All about the nature of politics and the finest of humanity being our ability to change to match our environment. We are how the universe consciously remakes itself. The inevitability of failure and the glory of standing back up after it.” He coughed out a chuckle. It sounded like a sob. “What I really meant was I’m sorry. Not just sorry I backed the wrong horse. Am sorry about that. But I’m sorry I compromised you while I did it.”

He paused as if Fred might answer, then shook his head.

“I think the speech would have worked. You and I have so much history behind us. Seems strange. I was a mentor to you once. Well. Feet of clay. You know how it is. Still, I really think you’d have seen the value in having me back. But this Holden prick?” Dawes shook his head. “You picked a shit time to die, my friend.”

The doors opened behind him. A young woman in an oil-stained Tycho Station jumpsuit and a deep-green hijab stepped in, nodded to him, and took a place in the pew, her head bowed. Dawes stepped back from the pictures of the dead man. There was more he wanted to say. Apparently there always would be.

He took a seat across the aisle from the woman, folded his hands in his lap, lowered his head. There was a profound mundanity in shared grief. A set of rules as strong as any human etiquette, and they didn’t allow for him to keep up his one-sided conversation. Not aloud, anyway.

The Free Navy could have been—ought to have been—a glorious moment for the Belt. Inaros had conjured up a full military for them out of nothing. Dawes had told himself at the time that Inaros’ failings as a political animal weren’t a problem. Were an opportunity, even. As a member of the Free Navy’s inner circle, Dawes could exert his influence. Be kingmaker. The cost was high, yes, but the rewards were nothing short of visionary. An independent Belt, cut free of the inner planets. The threat of the gate network under their control. Yes, Inaros was a peacock who made his way through life on charisma and violence. Yes, Rosenfeld had always had a whiff of brimstone about him. But Sanjrani was smart, and Pa was capable and dedicated. And if he’d said no, it would all have gone ahead without him anyway.

It was what he’d told himself. How he’d justified it all. The best would

have been that someone besides Inaros had acquired the ships. The second best was that Inaros' circle of advisors and handlers include him. So what was third?

After the abandonment of Ceres, Dawes had gone on playing the role of elder statesman for a while, even as Pa's rebellion made it impossible to pretend things were on track. When Aimee Ostman had found him, told him that Fred Johnson was putting together a meeting on Tycho, it had looked like an opportunity to broker peace. If not between Earth and the Free Navy, at least with the remains of the OPA. It had been the perfect way to leverage his relationship with Fred into a place at the table.

Another woman came in, sitting beside the one in the hijab. They exchanged soft words. Two men came in together, sat in the back. Change of shift was coming. Mourners would be stopping in on their way to work, or on their way back from it. Dawes felt a twinge of resentment that they should interrupt his time alone in the chapel. It was irrational and he knew it.

And anyway, Fred Johnson had made his wishes clear, even if he hadn't meant to. And Dawes still owed the colonel something.

"Is fucking bullshit is what it is," Aimee Ostman said. "James pinché Holden can fuck himself."

Dawes sipped his espresso and nodded. Holden's first move had been to humiliate her. For reasons Dawes understood. But still, for her to begin by losing face was hard.

"Forgive him for it," Dawes said. "I have. You should too."

"For for?"

Aimee Ostman scowled and scratched her chin. Her quarters in the station were wide and luxurious. One wall was taken entirely by a screen tied to an exterior camera, the resolution so fine it was indistinguishable from a window into space. The divan was spotless cream, the air scented with volatile molecules that mimicked sandalwood and vanilla. Dawes gestured at it all with his demitasse.

"Look at this," he said. "Room for an ambassador. For a president."

“And?”

“And he gave it to you,” Dawes said and took another sip. “Thought it was doing you honor. Best suite in the station.”

“He spat in your face,” Aimee Ostman said, pointing index and middle finger at him together like the barrel of a gun. “Kicked you out.”

Dawes laughed, shrugged. Invited her to laugh and shrug with him. It bit at his soul, but it was the thing to do. “I showed up unannounced. It was rude of me. Holden was in the right. How would you have been if I’d brought him to the back room at the Apex without telling you first?”

She scowled, her eyes tracking low and to the left. “Should have been more polite about it.”

“Maybe. But he’s new at this part.”

She sat across from him, folded her arms. The clouds in her eyes weren’t gone. He wouldn’t have expected them to be. But they weren’t thick with thunderbolts either. “Maybe,” she said. Grudgingly. “But I’m not staying. Not after that.”

“You should reconsider,” Dawes said. “If the plan came from Fred Johnson, it will be solid. And better that you be part of it than not.”

She grunted, but there was a hint of a smile at the corner of her mouth. That one found home. Dawes leaned into it a little, pressing his advantage.

“There has to be a grown-up in that room,” he said. “Holden’s a puppy. We both know that. We need you there to keep him from fucking everything up.”

“Holden’s the most experienced man in the system,” Dawes said. “He’s been on Medina. He’s been past it to the colonies. He walked off Eros Station before it woke up. He fought pirates for us. He went on diplomatic missions for us. His ship has berthed at Tycho Station more than anyplace else since the day he stole it from Mars. Holden has *years* working with the OPA.”

“There’s OPA,” Liang Goodfortune said, turning left down the corridor so that Dawes had to trot to keep up with them, “and there’s OPA.”

Tycho Station didn’t have the same breadth and depth as Ceres.

Everyone here had a job or access to one. The brothels were all licensed, the drugs all from a dispensary, the gambling all taxed. But the station was also a home to people who'd lived their lives in quiet rebellion against the inner planets, and that meant a kind of demimonde had existed there too. Workers for an Earth corporation whose first loyalty was to the Belt. And so there were clubs where the music had lyrics shouted in Belter cant, where the drinks and food called back nothing to a farmland under the bare sun, where the games were shastash and Golgo instead of poker and billiards. Liang Goodfortune fit in there like they'd never left.

"So it was Johnson's OPA," Dawes said. "He was a good ally."

"He was useful for an Earther," Liang Goodfortune said. "That's not saying much. And Holden's just the same. Another Earther for us to rally around? You know better than that, Anderson. Holden's worked for Johnson and Earth."

"On behalf of the Belt," Dawes said. "UN Navy kicked him to the curb before any of this began. His career was with a water hauler *because* he couldn't stomach being part of imperial Earth. Coyo can't change where he was born, where he grew up, but he's lived on float. His lover's one of ours."

"Savvy you he's loyal to the Belt because he's sleeping with Naomi Nagata? Or you think maybe she's *disloyal* à the Belt because she's with a squat? That knife cuts from the grip."

"Holden has been making a one-man propaganda campaign on behalf of the Belt," Dawes said, raising his voice over the ambient musical shout of the nightclub.

"His amateur anthropology feed? It's insulting y patronizing y shit," Liang Goodfortune said.

"It's well meant. And it's more than other people in his position have done. Holden's a man of action."

They came into the larger room, lights swirling around the bar, music thudding hard enough to press his lungs. Dawes had to lean in until his lips were almost brushing Goodfortune's ear. "I think if there's anyone in the system better prepared to stand against Inaros, you can't find them and neither can I. Either you make cause with him, or you go hat in hand to the Free Navy and say you're ready to take their table scraps. But do it soon, because I will wager everything I have that even if he has to go to war by

himself, James Holden will *destroy* Marco Inaros before this is done.”

“He can’t do it alone,” Dawes said, spreading his hands wide.

The *Desiderata of Bhagavathi* had been Carlos Walker’s ship for thirty years, and it bore the stamp of his peculiar aesthetic sense in every detail. The anti-spalling covers on the walls were gray, but textured to catch the light in smooth curves that rose and fell like the hills of a vast desert or the not-quite-identifiable skin of nude bodies. The crash couches on the command deck weren’t simple, utilitarian gray but a sculpted bronze that had nothing to do with the actual metal and ceramic that made them up. Music played on the speakers so softly it might almost have been Dawes’ imagination: harp and flute and a dry, hissing drum. It felt less like a pirate ship than a temple. Maybe there was room for both.

“That isn’t an argument that I should do it with him,” Carlos Walker said, handing over a drinking bulb. The whiskey that flooded Dawes’ mouth when he sipped was rich and deep and complicated. Carlos Walker smiled, watching him appreciate it. “I came out of respect for Johnson. I am staying out of respect. That respect doesn’t extend to dying on Holden’s errands. You say yourself that Medina is too well defended.”

“I say it’s well defended,” Dawes said.

“The rail guns will kill any ship that comes through the ring.”

“Perhaps,” Dawes said. “But keep in mind, this is Fred Johnson’s plan. And that Fred had access to Michio Pa and all that she knows about the station defense.”

Carlos Walker hesitated, though with him it expressed itself only as a slightly longer silence. He shook his head. “There’s risk in leaving Marco Inaros and his Free Navy to play themselves out. There’s danger in taking them on. But only one requires that I drive my ship into rail gun fire. I can’t agree to it.”

“Not every battle is won on the battleground,” Dawes said. “I respect your caution, but Holden hasn’t asked you to be vanguard. Hasn’t even asked you to go through the ring gate. Don’t assume he’s going to demand heroism and sacrifice. I know his reputation, but no one survives the things

he's survived without having a deep capacity for thoughtfulness and foresight. And more than that, strategy. Holden comes across feckless sometimes, truth, but he's a thinker. What he's doing? It's all from the head."

"You think he's not angry?" Dawes said. "Holden is here as much for vengeance as you are. This is a man who acts from the gut, from the heart, before his head gets in the way."

They were alone in the chapel, except for the images of Fred Johnson. It felt wrong to bring talk of violence and revenge into even as milquetoast a holy place as this, but grief came in all kinds of clothing. And this had begun as a moment to show respect for the dead. Micah al-Dujaili hunched forward, his arms resting on the back of the pew in front of him. His eyes were bloodshot.

"Carl talked to me," he said. "Said he couldn't stand by while the Belt starved. And Inaros killed him for it."

"Tried to kill Holden's wife too," Dawes said. He knew that wasn't quite true, but this was a moment for broad strokes. "Not because she was a threat. Not because she was of any sort of strategic value. Just because she'd embarrassed him, and he could."

"Inaros isn't who we thought he was. Everyone, they still call him a hero. They look at Earth and they look at Mars, and they cheer. They still cheer."

"Some still do," Dawes said. It was true. All through the system, Inaros had as many that loved him as had turned away. More, maybe. "It's not him, though. It's the idea of him. The man who stood up for the Belt. Only that man hasn't risen up yet. They only think he has."

"Will this Holden hurt him?"

"Every time Holden takes a breath, Marco Inaros suffers," Dawes said. And that was probably as close to truth as anything he'd said in the last two days.

Micah nodded slowly, then stood, wavering drunkenly, and threw his arms around Dawes. The embrace went on longer than Dawes felt

comfortable with. Just as he began to wonder if the other man was starting to black out, Micah stepped back, gave a sharp OPA salute, and walked out of the chapel, wiping his eye against the inside of his wrist. Dawes sat back down.

It was midshift, and almost midnight for him. The three Fred Johnsons still graced the front wall. The child, the adult, and the man who, all unknowingly, was at the end of his struggles. Fred Johnson as he had been. The way Dawes remembered him best was tied up and spitting angry the first time they'd met, and the flicker of disappointment in the man's eye when he realized Dawes wasn't going to kill him.

They'd fought a hell of a fight together, against each other and side by side. And then against each other again. The clash of empires, only he wasn't sure what the empires were any longer. Everything they'd done had brought them here, one dead, the other living a life he barely recognized or understood.

Humanity hadn't changed, but it had. The venality and the nobility, the cruelty and the grace. They were all still there. It was just the particulars he felt shifting away from under him. Everything he'd fought for seemed to belong to a different man in a different time. Well. It was in the nature of torches to be passed. Nothing to be sad about in that. Except that he was sad.

"Well, there you have it," he said to the empty air. "The kingmaker's last hurrah. I hope to hell you knew what you were doing. I hope James Holden is what you thought he could be."

It was almost an hour later that the door opened and a young man came in. Tight dark curls, wide-set warm eyes, a thin apologetic mustache. Dawes nodded to him, and the man nodded back. For a moment, they were both silent.

"Perdón," the man said. "Not rushing, me. It's only I'm supposed to take this one down now. It's ... it's on the schedule."

Dawes nodded and waved him forward. The man moved hesitantly at first, then reached a point of commitment where the work was just the work. The corporal came down first, then the head of the OPA. The young boy with the book and the grin stayed until last.

There had been a moment when that child had waved into a camera, decades ago, not knowing the gesture was also his last. The boy and the

Butcher were both gone now. The man took the picture down, rolled it together with the others, and slid them all into a sleeve of cheap green plastic.

He stopped on his way out. "You all right, you? Need something?"

"Fine," Dawes said. "I'm just going to stay here a little longer. If that's all right."

Chapter Thirty-Five: Amos

Sex was one of those things where the way it was supposed to work and the way it worked for him didn't always match up real well. He knew all the stuff about love and affection, and that just seemed like making shit up. He understood making shit up. He also understood how people talked about it, and he could talk about it that way, just to fit in.

In practice, he recognized there was power in being with another living body, and he respected it. The pressure built up over the weeks or months on the burn kind of like hunger or thirst, only slower and it wouldn't kill you if you ignored it. He didn't fight against it. For one thing, that was stupid. For another it didn't help. He just noticed it, kept an eye on it. Acknowledged it was there the same way he would anything powerful and dangerous that was sharing his workspace.

When they got into port someplace big enough to have a licensed brothel, he'd go there. Not because it was safe so much as it was an environment where he knew what all the dangers looked like. Could recognize them and not be surprised. Then he'd take care of what needed to be taken care of, and afterward, it wouldn't bother him for a while.

Maybe that was different from everyone else, but it worked for him.

The thing was, he'd usually be able to sleep afterward. Really sleep. Deep and dreamless and hard to pull up out of until he was done. And right now, he was mostly just looking at the ceiling. The last girl—the one called Maddie—was curled up next to him, the sheets draped around her legs, her arm under one pillow, snoring a little. One of the good things about getting a room for the whole night is they'd give you a quiet one away from the front. Maddie was someone he'd used and been used by before when the *Roci*'d been on Tycho, and he liked her as much as he liked anyone that wasn't in his tribe. That she felt safe sleeping next to him warmed something in his stomach that usually stayed cold.

She had a little gap between her front teeth and skin as pale as anyone he'd ever met. She could blush on command, which was a pretty good trick, and she'd been in the life since she was a kid. Before she'd come to Tycho for the legal trade. His own childhood in the illegal trade meant they had context that made the talk before and after more comfortable for him, and she knew he wouldn't pull any of that "you're better than this" soul-saving bullshit. He also wouldn't start calling her a bitch and being abusive out of shame the way some johns did. He liked shooting the shit with her afterward, and usually the way she snored just a little didn't keep him from drifting off.

Only that wasn't what was keeping him awake. He knew what was keeping him awake.

He got out of bed quietly so as not to wake her up. He'd paid her and rented the room for the whole night, and the house wasn't about to give him a refund for leaving early, so she might as well get the rest herself. He gathered up his clothes and slipped out into the hallway to get dressed. A john on his way out passed by as he was pulling on his jumpsuit, made brief and awkward eye contact, nodded curtly. Amos smiled his amiable smile and made room for the guy to go past before he zipped himself in and headed out toward the docks.

The *Roci* had spent more time in Tycho than any other port, usually getting put back together after the last whatever went wrong. It wasn't home—nowhere outside the *Roci* was home—but it was familiar enough that he could feel the differences. It was in the way people talked to each other in the hallways. The kinds of images that played on the newsfeeds. He'd seen what it was like for a place to change in ways that didn't change back. Earth was like that. Now Tycho. Kind of like a big, slow wave coming out from where the rocks had hit Earth and spreading through everyplace humans were.

There were people on Tycho who recognized him too. Not like they knew Holden. Holden, he couldn't walk through a room anymore without people staring at him and pointing and making a fuss. Amos had the sense that was going to be a problem eventually, but it wasn't one he knew how to fix. He wasn't even sure what it implied at this point.

Back at the ship, he headed down to the machine shop and his workstation. The *Roci* told him that Holden was in the galley with Babs,

Naomi was catching some bunk time, and Peaches was at work replacing the hatch seals they'd been talking about. He made a note on his work schedule to double-check them when she was done, even though he knew they'd be fine. Peaches turned out to be a pretty good worker. Smart, focused, seemed to really enjoy fixing things, and never bitched about the stresses of shipboard life. Perspective, he figured. Shittiest ship there was still had to be better than the best cell in the pit, if only because you got to pick that you were in it.

He shrugged into his couch, pulled up the technical reports, and spooled through the way he had before. Not that he expected to find anything different. Just to see if there was any reaction when he got to the weird bit. He got to it and looked at the data for a while. The torpedoes Bobbie had fired off. Their trajectories. The error logs. And he had the same reaction. It was bugging him.

He shut the workstation down.

"Hey," Peaches said, coming up from engineering with an ARL polymer tank slung over one shoulder.

"Hey," he said. "How's it going?"

She was still too skinny. The smallest standard jumpsuit still left her swimming in it. They'd had to adjust the code to convince the *Roci* that anyone flying on her could be so slight. Working made her look healthier, though.

She thumbed open a storage locker, slid the tank into place, and dropped into her couch. "I got the seals replaced, but I don't like the inner airlock door in the cargo bay. It's not throwing errors, but the power's dirty."

"Dirty dirty? Or inside the error bars but it pisses you off dirty?"

"Second one," Peaches said, and then grinned. But her grin faded fast. "You all right?"

He smiled. "Why do you ask?"

"Because you're not all right," she said.

Amos leaned back, shifted to crack his neck. Part of him wanted to talk to her about the torpedoes, but he couldn't picture Holden doing it. And this was kind of a Holden thing, so he only shrugged. "Need to talk to the captain about something."

“Then we’re back to the ‘throw ships at them until they run out of ammunition’ plan,” Bobbie said. Her voice was clear and sharp. Someone who didn’t know her might have thought she was pissed, but Amos was pretty sure that was her having a good time. He hesitated in the corridor outside the galley. Truth was, even if they decided to go after Medina like they were stomping snakes to death, they’d be in port for a couple more days. There’d be time to ask the question later that didn’t mean putting his elbow in the planning. But he also wanted to get some decent sleep, so he went forward anyway.

They were sitting across the table from each other, leaning in like two kids dissecting the same frog. The display between them glowed blue and gold. Holden looked tired, but Amos had seen him looking worse one time and another. Holden was the kind of guy who smoked himself down to the filter if he thought it was the right thing to do.

“We should talk to Pa again,” Holden said, looking up at Amos and nodding. “If we go for the station, we risk losing a lot of people.”

Amos ambled to the food dispensers. They were topped up fresh, so he had a lot of choices. There was a part of him that liked it better when it was just a few.

“It’s called war for a reason, sir,” Bobbie said. Even though she didn’t hit it, the *sir* had a sting. A reminder that it wasn’t just them anymore. “We know the fire rate. We know the retrain rate. We can do the math. If we can get even a small team onto the surface—”

“Of the alien station that we totally don’t understand but strapped a bunch of artillery to anyway,” Holden said. Bobbie wouldn’t be interrupted.

“—we can take control of them. The lack of protection on the station is the best shot I have.”

Amos keyed in *noodle soup*. The dispenser hummed and chugged for a second while Holden raised his eyebrows.

“Best shot *you* have?”

“I’ll lead the team,” Bobbie said.

“No. Look, I’m not getting you into this just because you want a fight.”

“Don’t be insulting. Name one other person you know you’d rather combat-drop onto a hostile station and I’ll bow out.”

Holden opened his mouth to reply, then just froze, gaping like a fish. When he finally closed it, his only reply was a shrug of defeat.

Amos chuckled. Both of the others turned to look at him as the bowl popped out, steaming and smelling like salt and reconstituted onion. “Anyone who can shut the cap’n up like that wins the ass-kicking contest every time,” he said, taking a spoon. “I’m not the boss of anything, but seems to me like having Babs here and not putting her in the front line? You use a welding rig to weld things. You use a gun to shoot things. You use a Bobbie Draper to fuck a bunch of bad guys permanently up.”

“Right tool for the job,” Bobbie said, and it sounded like thank you.

“You’re not tools,” Holden said. Then sighed. “But you’re not wrong. Okay. Just let me consult with Pa and Avasarala and the OPA Council, or whatever we’re calling it. In case someone has a better idea.”

Amos took a spoonful of noodle, sucked it up, and smiled while he chewed.

“All right,” Bobbie said. “But guideline? A decent idea now is way better than a brilliant plan when it’s too late.”

“I hear you,” Holden said.

“All right,” Bobbie said. “What about this Duarte asshole? What’s Avasarala’s guess on his reaction?”

“You know,” Amos said around his noodles, swallowed, “I hate to bust in, but you think I could borrow the cap’n for a few minutes?”

“Problem?” Holden asked at the same moment Bobbie said, “Sure.”

“Just need to check something,” Amos said, smiling.

Holden turned to Bobbie. “You should get some rest. I’ll fire off our notes. If we get enough sleep and eat breakfast after, we might even get some replies back.”

“Fair enough,” Bobbie said. “You’re going to sleep too, right?”

“Like the dead,” Holden said. “Just got to finish the stuff first.”

Bobbie rose up and headed out, tapping Amos’ shoulder with her knuckles as she passed. A silent *Thanks for having my back*. He liked her, but that’s not why he’d agreed with her. When you got a nail to drive, use the fucking hammer. Just made sense.

Amos sat down in her vacated spot, but sideways, with his back against

the wall and one leg running along the bench. His hand terminal chimed. Some update that Peaches had been running sending its system clear message to the team. As he watched, the *Roci* updated him: Alex was back on board. Amos shut the alerts off.

Holden looked like shit. Not *just* tired, exactly. His skin got waxy and his eyes sort of sank back in the sockets when that happened. Not exhaustion, then. Something else. He looked like a kid who just realized he'd jumped in the deep end of the pool and was trying to figure out whether he should embarrass himself by shouting for help or drown with a little dignity.

"You doing all right?" Holden asked before Amos had quite gathered his thoughts.

"Me? Sure, Cap'n. Last man standing. That's me. What about you?"

Holden gestured, hands out to the walls and bulkheads, the dock and station beyond it. The universe. "Fine?"

"Yeah, so. Peaches and I were doing the post-fight spit and polish."

"Yeah?"

"I went over the battle data. You know, usual thing. Make sure the *Roci* was doing all the stuff we expected her to do. Didn't need anything pinched or crimped or whatever. And, you know, part of that's looking at the armament performance."

Holden's jaw shifted just a little. It wasn't much. Probably wouldn't even have lost him a hand of poker, except Amos had known when to look for it. So that was something to remember. He took another spoonful of his soup.

"Those torpedoes that Bobbie fired off at the end," he said. "One of 'em scored a direct hit."

"I didn't know that."

"Okay."

"I didn't check."

"It hit," Amos said. "But it didn't go off. A dud is a serious problem. So I started looking at why it failed."

"I disarmed them," Holden said.

Amos put down his bowl, abandoned his spoon in it. The display Holden and Bobbie had been looking over shifted, trying to guess what Holden wanted to be shown.

“But that was the righteous thing to do,” Amos said. He didn’t make it a question, exactly. Just a statement that Holden could agree with or not. He didn’t want it to sound like anything was riding on it. Holden ran his hands through his hair. He looked like he was seeing something that wasn’t in the room. Amos didn’t know what it was.

“He showed me her kid,” Holden said. “Marco? He showed me Naomi’s son. Showed me that he was on the ship right then. Right there. And ... I don’t know. He looks like her. Not *like her* like her, but family resemblance. In the moment, I couldn’t take that away from her. I couldn’t kill him.”

“I get that. She’s one of us. We take care of us,” Amos said. “I’m only asking because those are the bad guys we’re planning to go up against again. If we’re not willing to win the fight, I’m not sure what we’re doing in the cage.”

Holden nodded, swallowed. The display gave up and shut down, leaving the galley just a little bit darker. “That was before we got here.”

“Yeah,” Amos said carefully. “Who your tribe is got kind of weird all of a sudden. If you’re the new Fred Johnson, that’s going to change what it means when you decide not to blow people up.”

“It is,” Holden said. The distress in his expression was like the growl of a power coupler starting to fail. “I don’t know that I’d do it differently if we were back there, in that same moment. I don’t regret what I did. But I know next time can’t be like that.”

“Naomi should probably be good with that too.”

“I was planning to talk to her about it,” Holden said. “I may have been putting it off.”

“So I gotta ask this,” Amos said.

“Shoot.”

“Are you the right guy for this job?”

“No,” Holden said. “But I’m the guy who got it. So I’m going to do it.”

Amos waited for a few moments, seeing how that answer sat with him.

“Okay,” he said, and stood up. The soup had gotten cold enough to have a little film forming on the top. He dropped it and the spoon into the recycler. “Glad we got that cleared up. Anything me and Peaches need to put on the schedule? Feeling like we should maybe give Bobbie’s stuff the once-over.”

“Pretty sure she’s already done that a few hundred times,” Holden said,

forcing a smile.

“Probably true,” Amos said. “Well, all right, then.”

He started out the door. Holden’s voice stopped him. “Thank you.”

He looked back. Holden looked like he was hunched, protecting something. Or like someone had kicked him in the chest. Funny how everyone else’s image of the guy got bigger and it made the real one seem small. Like there was only so much food to share between the two of them. “Sure,” he said, not certain what he was being thanked for, but pretty solid this was a good answer. “And hey. If you want, I can change the permissions so that you can’t disarm the torpedoes next time. If taking it out of your hands would help.”

“No,” Holden said. “My hands are fine.”

“Cool, then.” He headed out.

In the machine shop, Peaches was putting away her tools and running the closing sequences for her diagnostics. “Tested the new seals,” she said.

“They good?”

“Within tolerance,” she said, which was as close as she was probably ever going to get to saying they were good. “I’ll check them again tomorrow when the polymerization’s totally done.”

“Okay.”

The system chirped. She checked the readout, okayed it, and closed the display. “You heading out to the station?”

“Nope,” Amos said. Now that he bothered to notice, his body was feeling heavy and slow. Like coming out of a hot bath he’d stayed in a little too long. He wondered if Maddie was awake yet. If he got there quick enough, maybe he could finish up his night there. Except no. She’d be going on shift again about the time he was nodding off, and then it wouldn’t be clear if he’d come back to screw again, and that’d just be awkward. Unless ... He considered intellectually whether he wanted to screw again, then shook his head. “Nah, I’m just coming in. Going to grab some sack time now.”

Peaches cocked her head. “You came back early?”

“Yeah. I couldn’t sleep,” he said. “But I can now.”

Chapter Thirty-Six: Filip

Fixing your ship was what it meant to be a Belter. Earthers lived lives eating off the government dole and fucking each other into torpor by exploiting the Belt. Dusters sacrificed themselves and anyone else they could get their hands on for the dream of making Mars into a new Earth, even while they hated the old one. And Belters? They fixed their ships. They mined the asteroids and moons of the system. They made every scrap go longer than it was designed to. They used their cleverness and resourcefulness and reliance on each other to thrive in the vacuum like a handful of flowers blooming in an unimaginably vast desert. Putting hand to the *Pella* was as natural and proper as breathing in after breathing out.

Filip hated that he didn't want to do it.

In the first days, it was simple on-the-float work. Even then, he felt the eyes of the others on him, heard their conversations go quiet when he came in earshot. Josie and Sárta welding in the space between the hulls had said something about the dangers of nepotism, not knowing he was on the frequency, and then pretended they hadn't when he showed up. In the galley, newsfeeds from the crippled Earth were his best companions. His father didn't call for him or restrict his duties. Either would have been better than this nameless limbo. If he'd been cast down, he could at least have taken some pride in having been wronged. Instead, he woke for his shift, went to help with the repairs, and wished that he could be someplace else.

It was only when it came clear that the dead thruster was going to need a new housing that they burned for a shipyard. In other lives, they'd have tried for Ceres or Tycho, but the second-string yards were still decent. Rhea. Pallas. Vesta. They didn't use any of those. When his father's order came down, it was for Callisto.

A new escort came, guns bared, to keep the *Pella* safe from the torpedoes and attack ships of the enemy. But while Earth and Mars and

Fred Johnson's OPA probably had their eyes on the *Pella*, they didn't let themselves be pulled out from their bases and fleets. They were a prize, but not one worth risking for.

Lying in his crash couch, watching feeds of neo-taarab bands from Europa and half a dozen bad sex comedies because Sylvie Kai had roles in them, Filip fantasized that there would be an attack. Maybe a little fleet led by the *Rocinante*. James fucking Holden and Filip's own traitorous whore of a mother in command, screaming out after him with their rail gun and torpedoes. Sometimes the fantasy ended with someone else getting the *Pella* beat up even worse and everyone seeing how hard it was to win that fight. Sometimes it ended with them killing the *Rocinante*, blowing it into glowing gas and shards of metal. Sometimes he imagined that they'd lose and die. And the twin points of light in that last and darkest daydream fit together like a clamp bolt in its housing: It would be an end to working on the ship, and also they would never reach Callisto.

The surviving shipyard on Callisto stood on the side permanently locked facing away from Jupiter. Its floodlights cast long, permanent shadows across the moon's landscape and the ruins of its sister yard, a Martian base shattered years ago. Shattered in one of the first actions by the Free Navy. In Filip's first command. The dust and fines stirred up by the actions of human commerce fell slowly on Callisto, giving an illusion of mist where there was no free water and only the most tenuous atmosphere to carry it. He watched the scattering of floodlights on the moon's surface grow larger as they came in, white and bright and random like a handful of the star field had been grabbed and mashed into the dirt. When the *Pella* tipped down into a repair berth, the sound of the clamps coming into place was deep as a punch. Filip unstrapped and made his way to the airlock as soon as he could.

Josie was there—long, graying hair pulled back from his narrow, yellow-toothed face. Josie who'd been on the Callisto raid with him. Who'd been under Filip's command. He lifted his eyebrows as Filip started to cycle the lock.

"Not wearing tués uniform," Josie said, only the smallest sneer in his voice.

"Not on duty."

"Hast shore leave, tu?"

“No one said no,” Filip said, hating how petulant his voice sounded in his own ears. Josie’s gaze hardened, but he only turned away. The pressures went equal, or nearly so. When the *Pella*’s outer doors slid open, there was still a little pop. Enough to make Filip feel the change from one place to another, but not so much that his ears hurt from it. A security detail waited on dock wearing light armor with raw places on the shoulder and breast where the indistinct outline of the Pinkwater logo could still be seen like a shadow. He nodded to them with his hands and walked forward, half afraid they’d call him to stop and half hoping for it.

He’d never been to Callisto before his raid. Never seen it before he called the strikes down. He didn’t know what it had looked like before, and he could still tell that the surviving half showed the scars. Walking past the dock and into the commercial district, Filip could pick out which walls had been replaced. Here and there, a run of decking had a slightly off color, the sealant not as aged as the runs around it. Little scars. He might not even have noticed if he hadn’t known to look.

It had been justified, though. It had been to get the radar-eating paint from the Dusters so that the rocks they threw at Earth would be hard to see. It had been part of the war. And anyway, he hadn’t tried to hurt them. It was only they were right beside the enemy. Their fault. Not his.

Voices wove a rich and shifting murmur through the wide, tall main hall. A cart blatted for people to clear its path. Work crews in gray jumpsuits wore Free Navy armbands and split-circle OPA tattoos on their wrists. The air smelled of urine and cold. Filip found a place against one wall, set his shoulders against it, and watched like he was waiting for something. Someone to see him, stop, and point an accusing finger. *You were the one who tried to kill the yards! You were the one who cracked our seals! Do you know how many of us died?*

He waited for something to happen, but no one took any notice of him one way or the other. He was no one to them. A kid with his back against the wall.

The bar he ended up in was at the far end of the shipyard complex, close to the tunnels down to the deeper-level neighborhoods and the fast transit to the Jovian observatory on the far side of the moon. It wasn’t only yard hands at the pressed-polymer tables. There were girls his own age in bright clothes come up from the residential levels below. Older people in

academic-looking rumple hunched over their hand terminals and their beers. He'd known vaguely that there was a good upper university somewhere on Callisto, something associated with the technical institutes on Mars. Somehow never put it together in his mind with the place he'd been set to raid.

He sat apart, at a bright-pink table with a bowl of living grass as a centerpiece. From there he could watch the oversized wall screens with their scroll of newsfeeds muttering to themselves like angry drunks or else look over the finch-bright girls talking to one another and managing to never glance his way. He ordered black noodles in peanut sauce and a stout from the table display and paid with Free Navy scrip. For a long moment, he thought the table might refuse payment—if it said his money was bad, that would be when the girls looked over at him—but it chimed pleasantly, accepting, and threw up a countdown timer to when his order should come. Twelve minutes. So for twelve minutes, he watched the feeds.

The Earth still dominated, even in its suffering. Images of devastation mixed with earnest-looking newsreaders staring into the camera or else interviewing other people, sometimes earnest as sycophants, sometimes yelling like the other coyo'd been fucking their sweethearts. The bright girls ignored the screen, but Filip's eye kept wandering back to it: a street covered in ashes so deep the woman cleaning it had a scarred snow shovel; an emaciated black bear lurching one direction and then another in distress and confusion; some official of the half-dead Earth government surveying a stadium filled with body bags. The beer and noodles came, and he started eating without quite noticing that he had. He watched the march of images, chewed, swallowed, drank. It was like his body was a ship, and all his crew were about their work but not talking to each other.

The pride in the devastation was still there. Those dead were because of him. The ash-drowned cities, the blackened lakes and oceans, the skyscraper burning like a torch because not enough infrastructure still existed to extinguish it. These were the temples and battlements of his people's enemy, fallen into dust and ruin, and thanks to him. The raid he'd done here, at this yard, had let it happen.

And now here he was with the end and the beginning, one seen through the other like two sheets of plastic laid one on the other. Like time pressed flat. Still a victory and still his, but maybe there was a little aftertaste now,

trailing just after like milk on the edge of sour.

Say it like a man. Say I fucked it up. Only he hadn't. It hadn't been *his* mistake.

The shining girls rose in a flock, touching each other's hands, laughing, kissing each other's cheeks, and then scattered. Filip watched them walk out with a kind of forlorn lust, and so he saw it when Karal walked in. The old Belter could have been a mech driver or a drive tech or a welder. His hair was white and thinning and cut close to the scalp. His shoulders and hands and cheeks showed a lifetime of scars. He stood for a moment, looked around with an air of not thinking much of what he saw, and then lumbered over toward Filip's booth and sat across from him like they'd planned to meet there.

"Hoy," Karal said after an awkward moment.

"He send you?" Filip asked.

"No one send me, aber se savvy I ought to come."

Filip stirred his noodles. The bowl was hardly half empty, but his appetite was already gone. The slow, rolling anger in his gut seemed to take up all the space that food might want. "No need. Solid as stone, me, and twice as hard."

It sounded like a boast. Like an accusation. Filip wasn't even sure what he'd wanted the words to be, but not this. He ground his fork into the mash of noodles and sauce, shoved the bowl to the edge of the table for the server to take away. He kept the stout, though.

"Not throwing signs, me," Karal said. "But was a time I was your age. Long time, but I remember it. Me y mis papá used to have it out sometimes. He'd get high and I'd get drunk and we'd spend the whole day sometimes yelling at each other about who was the dumbest asshole. Throw punches sometimes. Pulled a knife once, me." Karal chuckled. "He cracked my ass the other way for that one. All I'm saying, fathers and sons, they fight. But you and yours? It's different, yeah?"

"If you say," Filip said.

"Your da? He's not just your da. Marco Inaros, leader of the Free Navy. Big man, him. So much on his shoulders. So much he's thinking on, worrying on, planning on, and it's not like tu y la can scrap it out like the rest of us."

"That's not what it is," Filip said.

“No? Bist bien, then. What’s it?” Karal said, and his voice was soft and warm and gentle.

The anger in Filip’s gut was shifting, unsteady as a scab on an infected wound. The rage and righteousness started to feel less authentic, like a wrap tied around something that wasn’t either. That was something worse. Filip gripped his hands in fists so tight they ached, but he lost his hold. The anger—not even anger, *petulance*—slid to the side and an oceanic sense of guilt rose up in him like a flood. It was too big, too pure, too painful to even have a single event to focus it.

It wasn’t that he regretted leaving the ship without permission or missing his shots on the *Rocinante* or killing Earth or wounding Callisto. It was larger than that. Regret was the universe. Guilt was bigger than the sun and the stars and the spaces between them. Whatever it was, all of it, was his fault and his failing. It was more than he’d *done* something bad. Like the fossil of an ancient animal was flesh that had been replaced by stone, whoever Filip had been once had kept his shape but been replaced by a raw and rising sense of loss.

“I feel ...*wrong*?” Filip said, scrabbling for words to describe something so much bigger than language. “I feel ... I feel like—”

“*Fuck*,” Karal said, breathy and sharp. His eyes were fixed behind Filip. Caught by something on the newsfeed. Filip turned, craning to see the screen. Fred Johnson looked out from the wall, dark-eyed, calm, somber. A red banner beneath him read, *Confirmed Dead After Free Navy Attack*. When he turned back, Karal had already pulled out his hand terminal and was shifting through newsfeeds as quickly as his crooked fingers could manage. Filip waited, then took his own terminal out. It wasn’t hard to find. It was all over the feeds—Belt and inner planets both. Sources from Tycho Manufacturing Collective on Earth were confirming the death of Frederick Lucius Johnson, formerly of UN Navy and longtime political activist, community organizer, and spokesman of the Outer Planets Alliance. He’d died as a result of injuries sustained during an ambush by forces of the Free Navy ...

Filip read it all, aware that there was something to it he wasn’t understanding. It was only a wash of words and images, disconnected from his life, until Karal, across the table from him and grinning, spoke.

“Gratulacje, Filipito. Guess you got him after all.”

Back on the *Pella*, music was playing over the ship system. A bright mix of steel drum and guitar and men's ululating voices raised together in celebration. Sárta, one of the first to see Filip when he came down the corridor from the airlock, scooped him up in her arms, pressing his cheek against hers and leaving him uncomfortably aware of her breasts. When she kissed him—briefly, but on the lips—she tasted of cheap mint liquor.

The galley was packed like a party. The whole crew, it seemed, gathered together in front of the newsfeeds that announced the death of the Butcher of Anderson Station. The heat of their bodies made the room feel stifling. His father was in among them, smiling and strutting and clapping people on the shoulder like the groom at a particularly fortunate wedding. All the sulking and menace were gone from his expression. When he caught sight of Filip across the crowded room, he put his hands together in front of his heart making a celebratory double fist.

This was, Filip realized, the first real victory since the first attack on Earth. Marco had been claiming success after success, but they'd all been for retreats and scuffles or the discipline killing of mutineers like the *Witch of Endor*. From the moment they'd left Ceres, the Free Navy had needed a solid, unequivocal success, and this was it. No wonder even the sober seemed drunk with it.

The newsfeed shifted, a Free Navy logo appearing in its place, and the roar of the group grew even louder as each told the others to be quiet. Someone cut the music and put the audio for the newsfeed in its place. When Marco appeared on the screen, more dignified and statesmanlike than the actual grinning man in the room, his voice rang all through the *Pella*.

"Fred Johnson claimed to speak for the same people he oppressed. He began his career by slaughtering Belters, then pretended to be our voice. His years as a representative of the OPA were marked by pleas for complacency, patience, and the constant deferment of the freedom of the Belt. And his fate will be the fate of all who stand against us. The Free Navy will defend and protect the Belt from all enemies, internal and external, now and forever."

The speech went on, but the crew began cheering so loudly, Filip couldn't hear it. Marco lifted his arms, not to quiet them but to bathe in the noise. His shining eyes found Filip again. When he spoke, Filip could read the words on his lips: *We did it.*

We, Filip thought as Aaman jostled into him, pressed a bulb of something alcoholic into his palm. *We did it. When it was a mistake, it was mine. When it was a victory, it was ours.*

In the center of the joyful storm, Filip felt himself growing still. A flicker of memory came to him, strong and rich with import as an image from a dream. He couldn't place its source. A film he'd watched, he thought. Some drama where a stunningly beautiful woman had looked into the camera and in a voice made from smoke and muscle had said, *He put blood on my hands too. He thought it would make me easier to control.*

Chapter Thirty-Seven: Alex

Good morning, Sunshine,” Sandra Ip said.

Alex blinked, closed his eyes, cracked open just the left one. He’d been in the middle of a dream where apple juice had gotten into the coolant feeds on a ship that was both the *Rocinante* and his first ship back when he’d been in the Martian Navy. The sense that he was supposed to fix something lingered even as the details faded. Sandra, naked, smiled down at him and he stopped trying to hold on to the dream.

“Hey to you too, Pookie,” he growled. The night’s sleep left his voice deep and gravelly. He stretched up his arms, palms flat against her headboard, and pressed to stretch down between his shoulder blades. His toes reached out past the edge of the blanket, and she pinched them playfully as she walked back toward the shower. He lifted his head to watch her retreat, and she looked back to watch him watch her.

“Where you headed?” he asked, partly because he wanted to know, partly just to keep her in the room a few seconds more.

“I’ve got a shift on the *Jammy Rakshasa* today,” she said. “Drummer’s making sure all these OPA bigwigs feel like we’re taking care of them.”

“*Jammy Rakshasa*,” Alex said, laying his head back down. “That’s a weird name for a ship.”

“It think it’s some kind of in-joke with Goodfortune’s people. Decent ship, though.” Her voice echoed a little from the bathroom. “The weirdest ship I ever worked was called the *Inverted Loop*. Gravel miner made out of a salvaged luxury yacht. The captain had this thing about open space, so they’d cut all nonstructural walls and decking out.”

Alex frowned up at the ceiling. “Seriously?”

“When that thing was under thrust, you could drop a bearing in the cockpit and listen to it hit every deck down to the reactor. It was like flying in a balloon full of sticks.”

“That ain’t right.”

“The captain was a guy named Yeats Pratkanis. He had some issues, but his crew loved him. Nothing like the stupid shit people do for a captain when they’re really invested in not seeing how fucked up he is.”

“S’pose that’s true.”

The sound of water splashing against metal announced the shower, but Alex could tell by the music of it that her body wasn’t in the flow yet. He looked up again, found her in the doorway, her arms lifted above her to rest against the frame. She was only a little younger than him, and the years showed on her body. Silver ghosts of stretch marks just visible along her belly and breasts. The fuzzy tattoo of a waterfall down the side of her left leg. A jagged scar that puckered the flesh of her right arm. Hers was not the beauty of youth but of experience, same as his. Still, he could see the girl she’d been in the way she lifted her eyebrows, shifted her weight into her hip.

“You want to take a shower, Sunshine?” she asked with false innocence.

“Oh hell yes,” Alex said, hauling himself up from the bed. “Yes, I do.”

Ever since that first night on Ceres, he and Sandra had been spending a chunk of their off hours in each other’s company this way. When they’d been on the *Roci*, they’d split their time between his cabin and hers. Here on Tycho, her quarters had become their default. She’d been on the station long enough for her seniority and union rules to land her two rooms, a private bath, and a bed that was a lot more comfortable for two than trying to fit into the same crash couch.

As love affairs went, Alex had been surprised at first and a little wary. Sandra’s sexuality was joyful and unrestrained. It had taken him a little time to knock the rust off and join her in it. He’d had a few lovers before he’d gotten married, one—shamefully—while he was, and a couple dalliances afterward. A woman’s full and delighted attention wasn’t something he’d ever expected to have again. Once he convinced himself that, yes, this was really happening, he fell into it like he was sixteen.

After the shower, they towed each other dry and he helped put lotion on her back where she couldn’t reach, and a little where she probably could too. She put on her uniform, tied back her hair, then brushed and gargled while he crawled back into the bed.

“Another day of sloth for you?” she asked.

“I’m a pilot with nowhere to go,” he said, stretching his arms out in a gesture that said, *It’s not my fault*. She laughed.

“This is why I’m not one,” she said. “Engineers always have something to do.”

“You need to learn to relax.”

“Well,” she said, her voice taking on a low purr that was come-on and laughing at the come-on both, “you keep setting me an example and maybe some of it’ll rub off on me.”

“Maybe when your shift’s over, we could order in.”

“It’s a plan,” she said, then checked the time on her hand terminal and grunted. “Okay. I’ve got to run.”

“I’ll lock up when I go,” Alex said.

“You’ll sleep in my bed all day like a lion.”

“Or that.”

She kissed him before she left. He let himself sink into the pillows after the door closed, rested there for a long moment, then stood up and gathered his clothes from the floor. Sandra’s quarters were soft and welcoming in a way he wasn’t used to. The comforter wadded and shaped at the foot of the bed was a pale blue with a pattern of lace at the edges. Sandra had hung draping cloth at the corners of the room to soften the light and disguise the edges. Her desk had a small glass vase with dried roses arranged in it. The peppery smell of spent perfume sank into his clothes when he was here, so that hours later he’d walk through a draft and be suddenly and viscerally reminded of her. The women he’d lived with these last years—Naomi, Bobbie, even Clarissa Mao now—weren’t the sort for frills and softness. Plush pillows and rosewater. Being around that particular kind of femininity was familiar enough to be comfortable, exotic enough to make this time, this moment, this relationship something all his own. Turned out some part of him had wanted something all his own.

Or maybe—pulling on the same sock he’d worn yesterday—it wasn’t even that. Maybe it was only that he knew how much the war might take from them all, and Sandra Ip was his chance to refill some cistern of his heart and body that there wasn’t going to be time for later. A place of gentleness and affection and pleasure like a hurricane eye. He hoped she felt the same about him. That they were stocking up good memories, him and Sandra both, against the history that was about to unfold around them.

It was getting harder and harder to shrug off the sense of dread back on the *Rocinante*. The days since they'd arrived on Tycho had been one endless meeting for Holden. When he wasn't fencing with Carlos Walker about what supplies and support the OPA could provide, he was trading long recorded messages with Michio Pa about the firing rate of the Free Navy's rail gun artillery in the slow zone. When he wasn't reporting to or getting reports from Avasarala, he and Naomi and Bobbie were comparing positional maps of the system with Aimee Ostman and Micah al-Dujaili. Holden never seemed to lose his temper, never seemed to rest. Every time Alex saw him, Holden smiled and was pleasant and upbeat. If he hadn't spent years with the man, he might almost have been fooled into thinking things were going well.

But the man in the meetings, pacing the corridors of the *Rocinante* or the docks outside them, sitting hunched over his flickering hand terminal, wasn't really James Holden at all. It was like Holden had become an actor and his role was *James Holden*. The surface was whatever it needed to be at the moment. That wasn't the man he knew. Alex could feel the howling void of desperation and despair behind everything he said.

It showed in the others too. Naomi had become quieter, more focused. Like she was always in the middle of puzzling through an impossible problem. Even Amos seemed on edge, though what it was about was so subtle that Alex couldn't have said for certain if that was even true. It might just have been his own fears projected against Amos' blank slate. And if Bobbie and Clarissa seemed immune from it all, it was only because they were relatively new to the ship. They didn't know the feel and rhythm of the *Rocinante* well enough yet to hear when she went slightly out of tune.

And every story of the Free Navy—another ship captured or killed, another Earth spy caught and executed on Pallas or Ganymede or Hall Station, another rock intercepted before it could hit Earth—turned the ratchet one more notch. The consolidated fleet was going to have to do something. And soon.

The little restaurant just off the main hall. Bright lights, a little redder spectrum than the sun. Syncopated harp-and-dulcimer music, which was apparently in fashion these days. Tall stools around a white ceramic bar. A plate of something not entirely unlike chicken in a vindaloo that was better than it had any right to be. Sandra had introduced the place to him the first

night on Tycho, and he'd become a regular since.

His hand terminal chimed the connection request, and Alex accepted it with his thumb. Holden appeared on the screen. It might just have been the dim light on the command deck or the blue of the monitor the captain was sitting in front of, but his skin looked waxy, his eyes flat and exhausted. "Hey," Holden said. "I'm not interrupting anything, am I?"

"Thanks for askin'," Alex said, maybe a little too heartily. He felt like he needed to haul the energy of the conversation up when he talked to Holden these days. As if he could inject health into the man by being so damned chipper at him. "I'm just finishing some breakfast. What's up?"

"Um," Holden said, and blinked. For a moment, he looked surprised. Like what he was about to say seemed a little implausible to him. "We're looking to ship out in about thirty hours. Clarissa and Amos are in the middle of their sleep shifts, but I'm calling an all-hands meeting in four hours so we can make sure we've got everything in order."

The way he said it sounded like an apology. Alex felt the words land like he was drinking something cold on an empty stomach. "I'll be there," he said.

"We're good?"

"Cap," Alex said, "this is the *Roci*. I made sure we were topped up and ready as soon as the docking clamps were in place. We could take off five minutes from now and be fine."

Holden's smile said he'd understood all Alex's subtext. "Still, good to get everyone together and double-check."

"No argument," Alex agreed. "Four hours?"

"Four and change," Holden said. "If Amos sleeps in, I'm going to let him."

"See you on board then," Alex said, and they dropped the connection. He took another bite of the vindaloo. It didn't taste as good. He slid bowl and fork to the recycler, stood up, waited a few seconds just so he wouldn't be going to find Sandra quite yet.

He went off to find Sandra.

Despite its name, the *Jammy Rakshasa* was an unexceptional-looking ship. Wide at the front, boxy, with a random studding of PDCs and thrusters scattered over her skin in a way that spoke of generations of use and modifications, the design growing and changing and leaving artifacts of its

previous incarnations like a house altered by tenant after tenant until the original architecture was all but lost. A Belter ship. If it hadn't been for the high security presence, both on the dock and floating around the ship itself, he'd have wondered if he was looking at the right one.

He waited outside the utility airlock, holding on to the wall with one hand as he floated. He saw Sandra before she saw him. A cluster of engineers and mechanical techs in environment suits floating together at a wall display, four different conversations going among the seven of them. Her hair was in a ponytail that waved like a flag when she shook her head, impatient with what the man beside her was saying. When she glanced in Alex's direction, she did a quick double take. He saw the smile start on her lips, saw it wilt. She finished her discussions, pushed herself off, gliding through the air toward him. By the time she grabbed a handhold and pulled herself to a halt, the knowledge was already in her eyes.

"Well," she said. "Orders came through?"

"Yeah."

Her expression softened, her gaze tracing the curves of his face. He looked at her, memorizing the shape of her eyes, her mouth, the little scar at her temple, the mole tucked almost behind her ear. All the details of her body. A bad habit in the back of his head fed him all the wrong things to say: *You should ship out with us and I can resign and stay here with you and I'll come back if you wait for me.* All the things that would make her feel better right then in the moment and break her trust in him later. All the things he'd said to women he loved before and not meant then either. She laughed gently, like she'd heard him thinking.

"I was never looking for a husband," she said. "I've had husbands. They're never what they're cracked up to be."

"My track record is I make a pretty shitty one anyway," Alex said.

"I am glad you're my friend," she said. "You make a great friend."

"You make a great lover," Alex said.

"Yeah," Sandra said. "You too. So how long?"

"Captain's called a meeting in"—he checked the time—"a little over three hours. Says we're heading out in a little less than thirty."

"You know where?"

"I expect he'll tell me when I get there," Alex said. He took her gloved hand. She squeezed his fingers gently and then let them go.

“So I get a lunch break in about an hour and a half,” she said. They were casual words, spoken carefully. Like if she bit down too hard, she might break them. “I could take it a little early. You want to meet up at my place? Freshen up the luck one last time before you go?”

Alex put his hand to her cheek. She braced a leg against the wall so she could press into his palm. How many millions of times had people had this exact conversation before? How many wars had put two people together for a moment and then washed them apart? There had to be a tradition of it. A secret history of vulnerability and want and all the things that sex promised and only occasionally delivered. They were just one more couple among all the countless others. It only hurt this time because it was them.

“Yeah,” he said. “I’d love that.”

The galley of the *Rocinante* smelled like coffee and maple-flavored syrup. Naomi shifted when Alex came in, making room for him on the bench. Amos sat on her other side, looking into nothing and scooping scrambled eggs from a bowl with two fingers. His eyes were still puffy from sleep, but he seemed alert otherwise. Clarissa stood in the doorway, uncertain but present. Alex thought about getting some food, but he wasn’t hungry. It would only have been so he had something to do with his hands.

A conversation between Bobbie and Holden echoed down the lift as they approached, their voices hard and competent and businesslike. Maybe even a little excited. There was an anticipation in the air that didn’t feel like joy, but wasn’t entirely unlike it either.

The melancholy in Alex’s chest and throat eased a little as they came in, Bobbie taking the bench across from him while Holden headed for the coffee. When he’d left Sandra’s quarters to come here, he’d carried a sense of loss with him. He still felt it. Would feel it for maybe days, maybe weeks, maybe forever. But not as strongly. And his people were here. His crew, his ship. The worst of the sting was already over and the sweet, he thought, would last. For him. Hopefully for Sandra. It was great sharing a moment with a genuinely good woman. There was a pleasure in coming home again too.

Holden took a sip of his coffee, coughed, and took another one. Clarissa slid in and took a seat behind Amos as if she could hide behind him. As Holden ambled over—head down, expression distracted—Bobbie reached across and tapped Alex on the wrist.

“You good?”

“Right as rain,” Alex said. “Said my goodbyes.”

Bobbie nodded once. Holden sat down facing them all, sideways on the bench. His hair was unkempt, his eyes focused on something only he could see. The attention of the room—Naomi’s, Amos’, Alex’s own—turned toward him. An ancient and barely familiar anticipation shifted in Alex’s chest, like a fragment of childhood beginning of school year.

“So, Cap,” he said. “What’s the plan?”

Chapter Thirty-Eight: Avasarala

Avasarala screamed.

Her breath ripped out of her throat, abrading her flesh as it passed. She tasted bile in the back of her mouth, and her legs trembled, ached, burned as she tried to push the steel plate another centimeter away.

“Come on,” Pieter said. “You can do this.”

She screamed again, and the plate moved away. Her legs went almost straight. The impulse to push through and lock her knees took effort to resist. It might snap her knees back the other way, but then at least this would be done.

“That’s eleven,” Pieter said. “Go for twelve. One more.”

“Fuck your mother.”

“Come on. Just one more rep. I’ll be here to help.”

“You’re an asshole and nobody loves you,” she gasped, lowering her head. The worst was the nausea. Leg day always seemed to mean nausea. Pieter didn’t care. He was paid not to care.

“You’re going down the well in twelve days,” he said. “If you want the leader of Earth, the hope and light of civilization, to get wheeled off the shuttle in a chair, you can stop. If you want her to stride out in front of the cameras like a Valkyrie returned from the underworld and ready for battle, you’ll go for twelve.”

“Sadistic fuck.”

“You’re the one who fell behind on your exercise schedule.”

“I’ve been saving the fucking species.”

“Saving humanity doesn’t prevent bone-density loss or muscular atrophy,” he said. “And you’re stalling. One more.”

“I hate you so much,” she said, letting her knees bend, easing the steel plate back closer to her. She wanted to cry. She wanted to puke all over Pieter’s pretty white exercise shoes. She wanted to be doing anything else at

all.

“I know, sweetie. But you can do this,” he said. “Come on.”

Avasarala screamed and pushed the steel plate away.

Afterward, she sat on the fake-wood bench in the locker room with her head in her hands until the idea of moving didn't disgust her. When she did finally stand up, the gray-clad woman in the mirror seemed unfamiliar. Not foreign precisely, but certainly not her. Thinner, for one thing, with sweat stains at the armpits and under the breasts. White hair that didn't fall to her shoulders so much as flow out, the thin lunar gravity too weak to pull it down. The woman in the mirror looked Avasarala up and down with dark, judgmental eyes.

“Some fucking Valkyrie,” Avasarala said, then headed for the shower. “You'll have to do.”

The good news was that Mars had finally slogged its way through its constitutional crisis, done the obvious thing, and put Emily Richards in as prime minister. No, that wasn't fair. There was more going well than just that. The rioting in Paris was under control now, and the racist cells in Colombia had been identified and isolated without any more murders. Saint Petersburg had fixed its water-recycling problem, at least for the moment. Gorman Le's mystery yeast was doing everything it had claimed on the tin, which increased the overall food supply for the survivors, and the reactors in Cairo and Seoul were working again so they could make use of it. Fewer dead people. Or at least fewer dead right now. Next week was always next week, and always would be.

The bad news still outweighed the good. The second wave of deaths hadn't slowed yet. The medical infrastructure was saturated. Thousands of people were dying every week from conditions that even a year ago would have been easily treated or cured. The violence over resources hadn't by any means stopped either. There were vigilante raids in Boston and Mumbai. Reports of whole police forces going rogue and hoarding relief supplies in Denver and Phoenix. The oceans were being choked. The sludge of dust and debris wasn't sinking as quickly as the models had suggested, and the light-eating plants and microbiota were dying off as a result. If there hadn't been so many fucking human beings stressing the food webs over the last few centuries, the system might have been more robust. Or it might not have. It wasn't as though they had a second Earth to use as a control.

History itself was a massive n=1 study, irreproducible. It was what made it so difficult to learn from.

After her shower, she changed into a lime-green sari, did her hair and her makeup. She was starting to feel a little better. It was the pattern she was noticing. The actual exercise left her miserable, but once she'd recovered, the rest of her day seemed to go a little better. If it was only the placebo effect, that was enough. She'd take what she could get, even if it was only tricks of the mind.

When she was almost ready to face the rest of her day, she opened an audio-only connection to Said. "Where do we stand?" she said instead of hello.

"The security group from Mars is finishing their meal," Said answered without missing a beat. "They'll be in the conference hall in half an hour. Admiral Souther will be there with you if you need him."

"Always good to have a penis in uniform in the room," Avasarala said sourly. "God knows they might not take me seriously otherwise."

"If you say so, ma'am."

"It was a joke."

"If you say so, ma'am. There's also a report in from Ceres Station. Admiral Coen has confirmed that the *Giambattista* is under burn just the way Aimee Ostman promised."

Avasarala held a pearl earring to her left ear, considering it. Nice. Understated. Didn't go with the sari, though.

"I'm sorry, ma'am?" Said's voice was confused.

"I didn't say anything."

"You ... ah ... you growled."

"Did I? Probably just an editorial comment about how pleased I am that we're trusting the fucking OPA now. Ignore it and continue."

"That's all you have on the schedule for today," he said, almost apologetically. "You did ask me to keep the afternoon clear in case the security briefing went long."

"So I did," she said, trying a pair of aquamarine studs that were much better. "Word from The Hague?"

"They say your office will be ready and the critical staff will be in place. We're on track to move the seat of governance back to the planet surface on schedule."

She imagined she heard a certain pride in Said's voice at that. Well, good. He ought to be proud. They all ought to be. Earth might be a pile of corpses and shit, but it was *their* pile of corpses and shit, and she was tired of looking up at it from the moon.

"About fucking time," she said. "All right. Tell Souther I'm on my way. And to bring me a sandwich or something."

"What sort would you like? I can meet you with—"

"No, tell Souther to do it," she said. "He'll think it's funny."

The conference room was the single most secure chamber in the solar system, but it didn't wear that on its sleeve. It was small enough for six people to sit comfortably. Red curtains on the walls to hide the air recyclers and the heaters. The table was wide, dark, and set just a little low to give a few centimeters more room for the holographic display. Not that anyone ever used holographic displays. Showy, but not functional. The Martian military attaché wasn't here to be wowed by graphic design, and Avasarala liked him for that.

The man himself—Rhodes Chen—sat on one side of the table with his secretary and assistant to either hand. Souther was already there too when she arrived, leaning back in his chair and laughing with Rhodes. A small tin plate waited at her chair—white bread and cucumbers. When Chen saw her, he stood, and all the others with him. She waved him back down.

"Thank you for coming," she said. "I wanted to be sure our allies on Mars were entirely up-to-date on the situation with the Free Navy."

"Prime Minister Richards sends her regrets," Chen said, taking his seat. "Things are still unsettled back at home, and she didn't feel comfortable being physically absent from the government building."

"I understand," Avasarala said. "And your wife? Michaela? Is she feeling better?"

Chen blinked. "Why ... yes. Yes, she's doing much better. Thank you."

Avasarala turned to Souther. "Admiral Chen's wife went to the cooperative school with my daughter Ashanti when they were girls," she said. Not that Chen remembered that, or had even known. In fairness, the girls hadn't been particularly close, but you played the angles the universe gave you. She picked up her sandwich, took a bite, and put it back down to give Chen a moment to hide his discomfort.

"I'm going to have to ask your staff to leave," Avasarala said.

“They can be trusted,” Chen said, nodding as if he’d agreed.

“Not by me, they can’t,” Avasarala said. “We won’t hurt them. But they can’t stay.”

Chen sighed. His secretary and assistant politely gathered up their things, nodded to Souther and Avasarala, and left. Souther lowered his head, waiting for the system to report whether either had left anything behind. It would be sad to come this far and have a bug in the room. A moment later he shook his head.

“Now then,” she said. “Shall we get down to business?”

Chen didn’t object, and Souther pulled up a schematic of the solar system in its present state. The sun and the ring gate as the major axis, and the planets and moons, stations and asteroids, scattered as the laws of orbital mechanics had placed them. As with any tactical map on that scale, the proportionality had suffered a little in favor of visibility. In truth, all of humanity’s children lived on scattered stones smaller than dust on the face of the ocean. They hid the fact with graphics and highlighted lists of ship names and vectors. Had the map matched the territory, there would have been nothing to see. Even the Earth with her suffering billions would have been less than a pixel.

But the Free Navy showed there in yellow. The consolidated fleet in red. Michio Pa’s breakaway ships and their new OPA let’s-call-them-allies in gold. It was rough and ugly. Souther pulled up a pointer, and drew the room’s attention to the ring gate at the system’s edge.

“Our target is Medina Station,” he said in his oddly high-pitched, musical voice. “There are several reasons for that, but critically, it’s the choke point for passage through to the colony systems, including Laconia, where former Martian naval officer Winston Duarte appears to have set up shop. Whoever has possession of Medina and its defenses controls the ring gates and traffic through them. It will reopen trade and colonization ships for us, and cut Inaros’ supply lines from his ally.”

Chen leaned forward, his elbows on the table, eyes glittering with the reflection of the display. He hadn’t reacted at all to Duarte’s name. Good poker face, and he’d expected to hear it. Richards wasn’t trying to deny the Martian Navy’s role in this clusterfuck. That was good. She took another bite of the sandwich and wished she’d thought to bring some pistachios. She didn’t have much appetite right after lifting weights, but when it

returned, she was ravenous.

“Inaros’ method of operation up to now has relied on strategic retreat,” Souther continued. “Stripping and abandoning territory rather than trying to hold it and leaving the support of the people left behind to the consolidated fleet. It has served him well in that we have been reluctant to overextend our defensive force, and the Free Navy has been able to carry out raids and attacks of opportunity on both Earth and Martian forces and dissenting factions on their own side.”

“The pirates,” Chen said.

“The pirates,” Avasarala agreed. No need to beat around that particular bush.

“We believe that strategy will fail with Medina,” Souther said. “Its importance is too great to abandon. And if we’re wrong and the Free Navy does abandon it ... Well, then we have all the advantages we were hoping for and he looks like a joke.”

“He won’t abandon it,” Avasarala said.

“What about the rail guns?” Chen asked. An interesting move, showing that Mars already knew about the defensive artillery. She wasn’t quite certain what letting her know they knew that was meant to achieve. Souther glanced at her. She nodded. No reason to pretend ignorance.

“Our best intelligence on that comes from the defectors from the Free Navy. Captain Pa of the *Connaught* was one of Inaros’ inner circle. Our understanding is that the rail guns set up on the alien station are Medina’s first line of defense. The station proper also had PDCs and a supply of torpedoes left by Duarte, but the rail guns are set to defend and destroy any unauthorized ships that pass through the ring gates.”

“That seems like a problem,” Chen said. “Your thoughts on how to overcome that?”

“We’re going to send a shitload of ships through the ring gates,” Avasarala said as Souther shifted from tactical to an image of the *Giambattista*. It wasn’t a pretty ship: large, boxy, and awkward.

“This is a converted water hauler crewed by the Ostman-Jasinzki faction of the Outer Planets Alliance,” Souther said. “It has been loaded with slightly under four thousand small craft. Breaching pods, small transports, prospecting skiffs. A devil’s brew. We’re calling it our Surinam toad, but the ship’s registered as the *Giambattista*.”

“That thing has four thousand reactors in it?” Chen said.

“No,” Souther said. “Most of the engines are chemical rockets or compressed-gas thrusters. Many of them are hardly more than environment-suit thrusters welded to a steel box. That is part of the reason they’re being carried to the edge of the ring before they’re ever deployed. These aren’t long-range craft. At a guess, I’d say half of them would be hard-pressed to make the trip from the ring gate to Medina under the best of circumstances. There are also several thousand torpedoes with a mixed but generally low-yield assortment of warheads.”

“So, chaff,” Chen said. “Cannon fodder.”

“We’re not putting people on all of them,” Avasarala said. “Even the OPA’s not that suicidal.”

Souther went on. “A fraction—the best ships—will carry a ground-attack group, whose mission will be to take control, not of Medina but of the rail-gun emplacements themselves. Once our forces control those, we expect Medina Station to capitulate. And since the rail guns were intended to defend Medina from more than thirteen hundred gates, and we’re only going to focus on the Sol and Laconia gates, we have reason to expect a relatively strong defensive position, which we can reinforce not only from Sol but with the colony ships that have already passed through and are willing and able to come to our assistance.”

“All right,” Chen said.

“You sound skeptical,” Avasarala said.

“No offense, ma’am,” Chen said. “But I’m looking at this, and it doesn’t square. If Inaros has been trying to tempt the fleet into overreach—spreading our forces too thin—then this run out to the edge of the system seems like his dream scenario. Unless you’re planning to send it unescorted, in which case you might as well not send it at all.”

“The escort will be a salvaged Martian corvette with a keel-mounted rail gun of its own,” Souther said. “The *Rocinante* is already burning on an intercept course. It’s going from Tycho Station, so it’s in the neighborhood. Relatively speaking.”

“There are also advantages to having that particular asset in place on Medina when we take it,” Avasarala said.

Chen’s laugh was thin and despairing. Avasarala stretched her right leg, feeling the ache in it. It would be worse in the morning. Lifting weights was

an argument against a benign God. As if that needed more evidence.

“Why bother, then?” Chen asked. “A single escort ship and an old ice hauler heading out to the most sensitive strategic position in the system? I don’t mean to be rude, but I have to think you don’t like the people in those ships very much. They’re going to have the whole Free Navy chasing them out and turning them to slag before they’re a million clicks from the ring gate.”

“That,” Souther said, “remains to be seen.”

If Chen had been a dog, his ears would have gone up just then. Avasarala saw it in his face and the set of his shoulders. “This,” she said, “is why we need to talk. In private. Securely. I need assurances, Mr. Chen, that the rot at the heart of your navy was well and truly burned out. I trust Emily Richards to look out for her own best interests and Mars’ too. In that order. And I’ve done a deep background check on you.”

“You’ve ... excuse me?”

Avasarala put out her hands, palms facing each other about a meter apart. “I’ve got a report on you this thick. I know every pimple you’ve popped since your voice broke. Everything. Praiseworthy, shameful, indifferent. Everything. I have violated your privacy in ways you can’t imagine.”

Chen went white, then red. “Well,” he said.

“I don’t give a shit about any of it,” she said. “The only thing I cared about was whether you had the stink of Duarte on your fingers. You don’t. It’s why you’re in this room. Because I trust you to take this back to Richards and no one else. And I need to know if you trust Mars.”

The silence in the room was profound. Chen pressed his fingers to his lips. “With this? Maybe. I get the sense you’re making some kind of request here. You should be very clear and explicit if that’s the case.”

“I want Richards to instruct the remnants of the Martian Navy—the ships in the consolidated fleet and the ones you have in reserve as well—to coordinate closely with Earth and the OPA and the fucking pirate fleet.”

“To do what?”

“Run a distraction campaign,” Souther said.

Avasarala waved him back, leaned in toward Chen, a smile on her lips. “Inaros isn’t going to chase after the *Giambattista* and *Rocinante*, because he’ll be distracted by the largest and most aggressive fleet action in history

kicking his balls up into his throat. By the time he understands what we were really after, it'll be too late for him to do anything but hold his dick and cry. But I need to know that you're in."

Chen blinked. His reserve cracked, just a little.

"Well," he said, "when you put it like that."

OceanofPDF.com

Chapter Thirty-Nine: Naomi

The *Rocinante* burned, but not straight for the ring gate. That would have been too obvious. The intention was to rendezvous with the *Giambattista* in an ambiguous orbit, leaving it unclear to anyone watching whether they were looking to position themselves in a long burn spinward toward Saturn, turn out toward the science station on Neptune, or make for the gate. Let Marco wonder a little bit, and be in position when the distractions started pulling his attention away. Assuming he was even watching where the *Roci* went.

Naomi assumed Marco was watching where the *Roci* went. She assumed everyone was. She understood how much her old friends hated her now.

Even in this moment of relative calm, Jim was spending ten- and twelve-hour shifts on the comms. When he wasn't sending out or receiving messages, he'd watch newsfeeds. The Free Navy presence was growing on Ganymede and Titan. The consolidated fleet splitting its forces in order to send guard ships to Tycho. Angry voices coming off Pallas to denounce the traitors who'd colluded with the inner planets; not just Michio Pa and her pirate fleet anymore but also the OPA factions that Fred Johnson had put together. It was how Jim tried to have control over something he couldn't actually control. The messages he watched and sent out were a kind of prayer for him, though he wouldn't have said it that way. Something that brought peace and the illusion that what they were caught up in wasn't so massively bigger than their own individual wills and hopes and intentions.

So even though it set her teeth on edge, she let him go on with it. She got used to falling asleep to the musical voices of Earth newsfeeds, waking up to the hard cadences of Chrisjen Avasarala and Michio Pa in her cabin.

"We will burn after we see the consolidated fleet commit," Pa said, her distant, muted voice sliding into Naomi's half-dream. She sounded so weary, it made Naomi want to go back to sleep in sympathy. "I understand

that's not a popular decision, but I'm not interested in having my people be the worm on Earth's hook."

"I never understood that," Naomi said. Jim closed his hand terminal display and settled the earphones down around his neck, his expression guilty. Naomi shifted, and the crash couch swung under them like one of the hammocks she'd grown up sleeping in. "How do hookworms figure into catching fish, anyway?"

"Not hookworms," Jim said. "Worms, like earthworms. Or insects. Crickets. You'd put them on metal hooks with a barb on the end, tie a really thin line to the metal hook, and throw the whole thing out into a lake or a river. Hope that a fish would eat the worm, and then you could haul the fish out with the hook that was caught in its mouth."

"Sounds inefficient and needlessly cruel."

"It really sort of is."

"Do you miss it?"

"The fishing part? No. The standing out on the edge of a lake or being in a boat while the sun's just coming up? That a little bit."

This was the other thing he did. Reminiscing about being a boy on Earth, talking about it as if she'd ever had experiences like his. As if just because she loved him, she'd understand. She pretended that she did, but she also changed the subject when she could.

"How long was I asleep?"

"It's still six hours until we're close enough to start docking," Jim said, answering her real question without having to check. "Bobbie's down in the machine shop with Clarissa and Amos doing some last-minute fixes to her combat armor. I get the feeling she's looking to suit up and stay suited up until she's on Medina."

"It has to be strange for her to lead OPA fighters."

Jim lowered himself to the gel of the crash couch, one arm bent behind his head. Naomi put her hand on his chest, just under his collarbone. His skin was warm. In the shadows, he looked vulnerable. Lost.

"Did she say something to you about it?" he asked.

"No. I was only thinking. She's spent so much of her life with Belters as the enemy, and now she's going to an OPA ship filled with OPA soldiers. We aren't her people. Or we weren't before now."

Jim nodded, squeezed her hand, and then slid out from under it. She

watched him dress in silence for almost a minute.

“What is it?” she asked.

“Nothing.”

“Jim,” she said. Then, gently, “What is it?”

When he did his little, percussive, surrendering sigh, she knew he’d given up trying to protect her from whatever it was. He pulled on his undershirt and leaned against the wall.

“There was something I meant to talk about with you. About the ambush where Fred died?”

“Go ahead.”

He did. Connecting to the *Pella*, trying to distract Marco, seeing Filip, disarming the torpedoes. He told it all with a sheepishness like a kid confessing that he ate the last bit of sweet. Even when she turned up the cabin lights and started pulling on her own clothes, he didn’t meet her eyes. Amos had called him on it, offered to lock him out of the torpedo controls. Jim had said no. His silence was the only sign that he was done.

Naomi stood for a moment, watching her emotions like they were objects scattered by an unexpected turn. Horror at the idea of Filip’s death. Rage at Marco for putting their child in harm’s way. Guilt, not only for Filip but for Jim too. For the position she’d put him in and the reflexive compromises he’d made on her behalf. All those she’d known to expect, but there was an impatience too. Not with Jim exactly, or herself, or Filip. With the need to mourn again what she’d mourned so many times before.

“Thank you,” she said, her heart thick and heavy. “For caring. For trying to watch out for me. But I lost Filip. I couldn’t save him when he was a baby. I couldn’t save him now that he’s essentially a man. That’s twice, and twice is always. I can’t stop hoping that he’ll be all right in all this. But if he’s going to get saved, he’s going to have to do it himself.”

She pushed away a betraying tear. Jim took a half step toward her.

“He’ll have to do it himself,” she said again, her voice a degree harder to keep him from touching her or saying something soft and consoling. “Same as everyone.”

When the *Giambattista* got into clear visual range, she wasn't a pretty ship. Longer than the *Canterbury* had been back in the day, thicker through the middle, with a score of massive storage cells open to the vacuum where it had stored the ice harvested from Saturn's rings or captured comets or any of the other sources around the system. Between the floodlit work shelves, the external mech storage sheds, attitude thrusters and sensor arrays and antennas, there were so many sources of drag that even the thinnest atmosphere would have ripped the ship to scrap. But no torpedo tubes. No PDCs. There were thousands of tiny boats tucked into the huge ship, and nothing more than a winsome smile and a handgun to protect them.

On the command deck, Bobbie put one hand on Naomi's shoulder, another on Jim's. "Freaking out yet?"

"I'm fine," Naomi said in the same moment that Jim said, "Yes."

Bobbie's chuckle was warm. She was as happy as Naomi had seen her since she'd come back to the ship. She walked across the deck, mag boots clicking with each contact and release. It made Naomi nervous. If something happened to make the *Roci* move suddenly, either the boots would hold the deck and break her shinbones or they'd release and leave her bouncing against the walls of the ship. Not that the danger was real. It was only that, like Jim, she was probably freaking out. At least a little bit.

She watched the *Giambattista*'s braking pathway. The main engines turned off, the plume cooling and speeding away from the ship. It coasted toward them. Six thousand clicks. Five and three-quarters. Five and a half.

"All right," Alex said across the ship's comm. "Everyone hold on to your feathers. We're maneuvering to dock."

To Naomi's relief, she heard Bobbie strapping into a couch behind her as Amos and Clarissa announced that they were secure.

"Can you knock?" Jim asked.

She opened a tightbeam connection. Waited a long moment, and found herself face-to-face with a man whose white beard and salt-and-pepper hair made him look like something out of a children's story about wolves in human skin.

"Que sa, *Giambattista*," she said. "*Rocinante*, wir. Go es gut alles la?"

The wolf grinned. "Bist bien, sera Nagata suer. Give us your warriors girl, and let us kick these cocks à l'envers a pukis."

Naomi laughed, less at the vulgarity of the image than at the glee with

which the old man said it. “Bien. Prepare for docking.” She cut the connection and called up to Alex. “We have permission to dock.”

Behind them, Bobbie was humming a melody Naomi didn’t recognize, but it was syncopated, upbeat, even playful. The *Roci* lurched, the couches all shifting a few degrees to compensate. They were almost in matching orbit. Only a few meters’ drift, and the thrusters under Alex’s care were drawing that down to nothing.

“He knew your name,” Jim said.

“You’re not the only one people recognize,” she said as the docking tube extended from the *Roci* and fixed itself to an outer airlock on the *Giambattista*. So close in, the hauler dwarfed the corvette. A horsefly and a horse. The scale of what they were about to try came home to her then and took her breath away. These two ships were the stealthy, small force. Easy to overlook in a system wracked with violence. Tiny to the point, they all hoped, of insignificance. And still huge.

“Are we going to be knocking around anymore?” Bobbie asked. “Because otherwise, I’m going to go get dressed and head over.”

“You wearing your power armor just walking across the tube?” Alex asked.

“You know how it is,” Bobbie said. “Never get a second chance to make a first impression.”

“Awesome,” Alex said.

“I’ll meet you in the lock,” Amos said.

Naomi looked over to Jim. He was frowning. “Say again, Amos?”

“Yeah,” Amos said. She could hear the smile in his voice. “I thought I’d head over with Bobbie. These OPA fuckers are our best buddies and all, but we’re still us and they’re still them. Someone oughta watch Bobbie’s six while she’s out among them English. Besides which, I’m going to be as good as any of them at breaking heads.”

“Might need you on the *Roci*, big guy,” Jim said, his voice light. “With the whole heading-into-battle thing, I’d kind of like to keep my mechanic close to hand.”

Bobbie retreated down the lift tube, pulling herself hand over hand, her floating feet disappearing last.

“That’s sweet, but you don’t need me, Cap,” Amos said. “Peaches here knows the ship as well as I do. Anything you need done, she can do it.”

Jim grunted, and she put her hand out, grabbing the edge of his couch and spinning it until they were facing. Jim saw the message in her expression. “Copy that, Amos,” he said. “Bobbie? Make sure you bring enough of him back we can regrow the missing bits.”

“Roger. Wilco,” Bobbie said. Her voice sounded close and echoing. She already had her helmet on. Naomi wanted to be reassured by the joy that Bobbie took in the anticipated violence, but she couldn’t quite manage. All she could do was hunker down and endure and see what happened next. At least she had practice with it.

Over the next hours, Bobbie and Amos inspected their new allies—the ship’s reports and logs, the ships in their berths, the OPA fighters they’d be leading on the attack—while Naomi, watching through Bobbie’s suit camera, cataloged it all. Racks of guns and boxes of ammunition. The motley assortment of boats and soldiers. Bobbie’s assessments were calm, rational, professional, and fueled the dread growing in Naomi’s gut.

Her mind wandered a little bit during the slow moments. Human violence as a kind of fractal—self-similar on all scales from bar fight to system-wide war. The buildup of insults and lost face that swelled over the course of an evening or a century. The shoving and shoving back, neither side sure they wanted to escalate and uncertain how to back down. All of that was the history of the inner planets and the Belt since the beginning. Then Marco had thrown his sucker punch and sent the system reeling back. Since then, feints and evaluations, flurries of violence that weren’t meant to end anything so much as find position, test the opponent.

Everything since the rocks fell on Earth had been preparation for this: a counterattack made in earnest and without reservation. Each side hoping to engineer a punch that the other didn’t see coming. Forgotten arm. Maybe it was in their blood, their bones. A shared human heritage. The pattern they were exporting to the stars now. It left her tired.

“Well, it’s not what I’d pick, but it’s better than I’d hoped,” Bobbie said from her new, cramped quarters on the *Giambattista*. In the background, Naomi could make out Amos’ voice, lifted and laughing among others. Fitting in with the new group. Or no, that wasn’t right. Letting the new group think he fit in. She had a terrible sense that he wouldn’t come back on the *Rocinante*; the empty premonitions of anxiety and impatience.

“Do you want to check the boats in more depth?” Naomi asked.

“No,” Bobbie said. “I can do that on the way. Pull the trigger. Let’s get this apocalypse on the road.”

“All right,” Naomi said. “Stay safe.”

“Good hunting. We say, ‘Good hunting.’”

“Good hunting, then.”

The words were powerfully inadequate. She dropped the connection, unstrapped, braced herself against the handholds on the wall, and stretched her arms, her legs, worked the kinks in her spine. When she was done, she realized it was the same routine she did before she worked out. Preparing for great effort.

She went down to the galley where Alex and Jim and Clarissa were eating together. They all looked over at her as she pulled herself into the room. “Bobbie says we’re good to go.”

“Well, shit and yahoo,” Alex said.

Jim pulled his hand terminal out of his pocket, tapped through a set of commands including one with a double password, then pressed a button.

“Okay,” he said. “Signal’s out. As soon as the attack’s under way, we’ll burn for the ring and hope no one notices us.”

They were all quiet for a moment. Naomi felt like there should have been some kind of fanfare. Gongs and trumpets to announce the coming death and destruction. Instead, it was just the galley, the four of them, the sound of the air recyclers, and the smell of chicken.

“Looks like a shit night for sleeping,” Naomi said. “I’m going to be up watching the newsfeeds.” Jim didn’t say anything. His eyes were sunken with exhaustion and something else. Not fear. Worse than fear. Resignation. Naomi pushed off, braced beside him, and put her hand on his. He managed a smile. “I’ll bring drinks and snacks. We can watch the fireworks start.”

“I don’t know,” Jim said.

“It ain’t sulking if we all do it together, Hoss,” Alex said. And then, to Naomi, “Count me in.”

“Me too,” Clarissa said, and then didn’t add *if I’m invited*. Against the backdrop of the war, it was such a small thing, and Naomi was still glad to see it.

“Yeah,” Jim said, “okay.”

It took hours. All across the system, drive plumes flared. Around Ceres and Mars and Tycho, the consolidated fleet leaped away from their

defensive positions and into the Belt. The scattering of Michio Pa's pirate fleet joined in, and the OPA. By the time the last of them reported that they were on the burn, the ships of the Free Navy were starting to react. The *Rocinante* traced vectors and travel groups, threads of light tangling the emptiness between stations and planets. Battle lines. The newsfeeds lit up—civilian, government, corporate, and union all becoming aware that something was happening and leaping to make sense of what it could be.

It was just after midnight, ship time, that the *Roci* raised the alarm.

"What do we have, Alex?" Jim asked.

"Bad news. I'm seeing a couple of fast-attack ships headed our way out from Ganymede."

"Well, so much for not being noticed. How long before they reach us?" Jim asked, but Naomi had already queried the system.

"Five days if they're just buzzing us and looping back," she said. "Twelve if they try to match orbit while we're on the burn."

"Can we take them?" Clarissa said.

"If it was just us, might could," Alex said. "Problem is we're guarding this cow. But if we burn hard enough, we might make the ring before they get us."

"Figure it out on the way," Jim said. "Right now, we need to get the *Giambattista* up and burning as hard as it can and still let Bobbie do her inspections."

"No plan survives contact with the enemy," Alex said, unstrapping and pulling himself up toward the cockpit. "I'm warming her up."

"I'll tell our friends across the way to do the same," Holden said, taking comm control.

On Naomi's monitor, the thousands of hair-thin lines marked where the battles were, and where they were expected to be. On impulse, she took down the tactical display, leaving just the wide scatter of drive plumes all around the system, and then added in the star field.

It was the widest concerted attack ever. Hundreds of ships on at least four sides. Dozens of stations, millions of lives.

Among the stars, it didn't stand out.

Chapter Forty: Prax

The more time passed, the clearer it became how little Ganymede's official neutrality meant. The ships in the docks and orbiting the moon were more and more Free Navy ships, fewer and fewer anything else. The soldiers in Free Navy uniform appeared more often at the tube stations, in the markets, in the public halls and corridors, first with the apparent casualness of citizens, then in larger groups with more aggressive demeanors. Then with armored emplacements that would allow them to shoot in safety whoever happened by.

Djuna had stopped letting him watch the local newsfeeds at breakfast on the weekends. Too many stories about bodies being found in unfortunate conditions. Too many missing people, too many espionage claims, too many reminders from the still-official security apparatus that Pinkwater was an unaffiliated corporate entity with no political litmus tests and only the safety and well-being of the citizens of Ganymede at heart. The sorts of things people said because they weren't true.

For Prax, the official news and the gun-wielding soldiers weren't the most disturbing things. There were smaller things that he noticed. The way that the girls didn't fight against being home by curfew anymore. The wistful conversations Djuna would start about taking positions somewhere else, emigrating off Ganymede entirely, and then end without ever drawing a conclusion. The small things carried more weight. Yes, a dissident circle was killed. Yes, people disappeared. But—apart from Karvonides—they weren't people he knew. And the change in the station was also changing his family. It was also changing him.

Prax went about his work because there was nothing else to do. It wasn't as if things would be made better by hiding in his bed. And the appearance of normalcy was sometimes almost as good as the real thing. So he went to the meetings in the mornings, worked with his plants in the afternoons.

Some of the runs had to be scaled back. Research and development weren't a priority as much as generating food to resupply the warships. Prax thought that was shortsighted. If anything, disruptions like this were an argument for more research, especially with the radioplast work that Khana and Brice had under proposal. He tried bringing the point up now and again. He'd even gone so far as to ask whether there was a contact with the Free Navy that the labs could talk to about it. No one was enthusiastic about it, though. So that was something else the occupation had taken away.

Under it all, the fear of what he'd done in sending the data to Earth hung over him. It was almost a relief when the security forces finally came.

He was in the overflow hydroponics lab at midafternoon. Rows of black-leaved plants rose up from the tanks toward the light banks. The roots that pushed through the underlying aqueous gel were pale as snow. Prax was moving from plant to plant, his hands in light-blue NBR gloves. He checked each leaf gently, looking for sprays of yellow and orange where the radioplasts were dying. Until the man called his name, his afternoon had been going pretty well.

"Dr. Meng?"

There were four people, all of them men. Two wore simple uniforms with the Pinkwater logo on the breast and shoulder. The other two were Free Navy. Prax felt his heart thud against his chest as the adrenaline hit, but he tried not to look more than a little uncomfortable. Anyone would be a little anxious when the Free Navy came asking for them. Even the innocent. He thought that was right.

"Can I help you?"

"We need you to come with us now," the taller of the two Free Navy men said.

"I can't," Prax said, gesturing toward the plants he hadn't checked. As if that were explanation enough.

They stepped closer, moving around him. They all had sidearms. Handcuffs. Canisters of restraint spray.

"You have to come with us now," the tall man said again.

"Do ... do I need my union representative?" he asked, but he wasn't surprised when the shorter of the Free Navy men pushed him in the small of the back. *I could run*, he thought. *It wouldn't help, but I could do it.*

They marched him out through the front office. When they passed Brice

in the hall, she looked away, pretending not to notice. The front desk was abandoned, everyone suddenly called to the restroom or a coffee break at the same moment. None of the people he worked with would actually see him leave. That's how quickly the right kinds of power could make someone disappear. Walking out the front door for what he had to assume was the last time, it felt like an epiphany. He'd wondered, watching the newsfeeds, how so many could go missing in a station with people and cameras everywhere. He understood now.

All they had to do was make it too dangerous for others to watch.

They loaded him into a cart, drove off down the main corridor, down the southern exchange ramp, and into a well-lit concrete hallway. He had the sudden, visceral memory of waiting here back after the mirrors fell, when the survival of Ganymede Station had been an open question. He'd waited in line right there, trying to find Mei. It would be her turn now to wonder what had happened to him. Symmetry.

At the Pinkwater office, they took him to a small, cold room. Green walls. Green floor. Everything stank of industrial cleaner. The kind they used to clean up blood and spit. Biohazard stuff. A chair bolted in place in front of a cheap, plastic desk. Black dots along the wall shifted toward him like the eyes of a spider. Not cameras, but the same multifrequency image arrays he used in the labs. They were sensitive enough to pick up his heart rate from changes in his skin and track the heat in every part of his body. He'd used them extensively on last year's soybean experiments, and seeing them here felt almost like betrayal.

The taller Free Navy man came in. A dark-skinned woman in a Pinkwater uniform with him. Prax looked up. He'd imagined this moment so many times in the middle of dread-soaked nights that now that it was happening he was almost curious to see how well it met his expectations. Would they beat him? Threaten him with violence? Would they threaten Mei and Djuna and Natalia? He'd heard that sometimes they would addict prisoners to drugs and then threaten to withhold their supply and let withdrawals do the work.

"Dr. Meng," the tall man said, sitting across from him. Did they take focus drugs? Prax had heard of focus drugs, but he didn't know how they worked. "You were supervisor for Quiana Karvonides? You're on record as identifying her body."

“I am,” Prax said. Was there a way to pretend his way out of this? Would they believe him if he denied everything he could deny? Or would he give himself away? All the black, mechanical eyes on him, and the tall man’s pale-brown ones too. Only the Pinkwater woman was looking at her hand terminal. “I did. Karvonides didn’t have family on the station, I think. I’m not sure about that, though. Is something wrong?”

“She was working on proprietary yeast? Is that right?”

“That’s one of the projects we do,” Prax said, nodding. He was being too anxious. They’d know.

“She was working on it particularly?”

Prax’s mouth was dry, and the cold of the room seemed to creep up his legs and into the base of his spine. What had he done? Why hadn’t he kept his head down? But no, that wasn’t right. He had reasons for taking every action he took. And he’d known there were risks. Being here in this room was one, even if he hadn’t known which room in particular. He wondered whether there were other people watching him, or if the spider eyes fed into some sort of software that analyzed him and fed them the answers.

“Dr. Meng?”

“Yes, sorry. Yes, she worked on the harvester yeast. It’s an organism, um, that harvests a very broad range of electromagnetic radiation, the way that a plant uses light. It’s reverse-engineered from the protomolecule data. It lets the yeast generate its own sugars from the radioplasts, and then, um, its native systems can convert that into higher-complexity nutrients.”

The two shared a look. He couldn’t tell what its significance was. How would Mei do without him? She was older now. Nearly adolescent. She was going to start pulling away from the family unit soon anyway. Maybe that wasn’t such a bad time to lose him. Would they put his body back in the recycler? He couldn’t think like that. Not now.

“What can you tell us about Hy1810?” the woman asked, and Prax felt like she was looking through him. Seeing his bones and the shape of his blood vessels. He’d never felt more naked. He tried to lean back in his chair, to rock it a little back and forth, but the bolts only grated a little. There were notches and scrapes on the wall he hadn’t noticed until now. Painted over, yes, but there. He didn’t want to think about what had made them.

“It’s the tenth variation using protocol eighteen,” he said. “It’s

proprietary. I'm not supposed to talk about that. I'm sorry."

"Why did you move the Hy1810 data out of Karvonides' partition?"

And there it was. They knew. He took a breath, and he could hear it shaking in his throat. They wouldn't need focus drugs or psych computers. He was readable as plain text. It had been a dream that he might avoid the worst. All that was left was watching it play out. He felt a vestigial, unreasoning hope. There had to be a way. He had to get back home, or else who would make pancakes for the girls?

"I moved it on the request of some of the other project engineers. With Karvonides' passing, they needed to have access to the run data. Otherwise there was no way to move forward. So, yes, I put it in a partition where they could reach it."

"Did you review the permissions on that partition?"

"The information was proprietary," Prax said, clinging to the idea like it was the last, water-logged fragment of the ship that had sunk beneath him. It sounded weak, even to him.

The man leaned forward. "That data was sent to Earth. We've isolated the tracking data on it, and it came from the partition *you* put it in."

Lies and denials bubbled in his mind. *Anyone could have accessed that data. I was sloppy. Careless with security, maybe. That's all. I didn't do anything wrong.*

In his mind's eye, he saw Karvonides again. The wounds on her neck and head. Yes, he could deny her again, but it wouldn't make any difference. They already knew, or near enough. They'd push him, torture him, and he would break. It didn't matter what he said now. He was dead. No more pancakes. No more evenings coaxing the girls into doing their homework or Sunday mornings waking up late with Djuna. Someone else would have to take over his research. Everything he'd loved, everything he'd lived for, was gone.

To his surprise, it felt less like fear than a sort of terrible freedom. He could say anything he wanted now. Including the truth.

"The thing you need to understand," he said, an irrational, intoxicating courage blooming in his heart. "Biological equilibria? They're not straightforward. Never."

"Equilibria," the man repeated.

"Yes. Exactly. Everyone thinks that it's simple. New, invasive species

comes in and it has an advantage and it outcompetes, right? That's the story, but there's another part to that. Always, *always*, the local environment resists. Yes, yes, maybe badly. Maybe without a clear idea of coping with novelty. I'm not saying it's perfect, but I am saying it's there. Even when an invasive species takes over, even when it wins, there is a counterbalancing process it has to overcome to do that. And—" The tall man was scowling, and his discomfort made Prax want to speak faster. To say everything he had in his heart before the hammer fell. "And that counterprocess is so *deep* in the fabric of living systems, it can never be absent. However well the new species is designed, however overwhelming its advantages seem to be, the pushback will always be there. If one native impulse is overcome, there will be another. You understand? Conspecifics are outcompeted? Fine, the bacterial and viral microecologies will push back. Adapt to those, and it'll be micronutrient levels and salinity and light. And the thing is, the thing is, even when the novel species *does* win? Even when it takes over every niche there is, that struggle alone changes what it is. Even when you wipe out or co-opt the local environment completely, you're changed by the pushback. Even when the previous organisms are driven to extinction, they leave markers behind. What they are can never, *never* be completely erased."

Prax sat back in his chair, chin high, breath deep and fast, nostrils flared. *You can kill me. You can wipe me from the rolls of history. But you can never change the mark I've made. I stood against you, and even when you've killed me, it won't undo the things I've done.*

The man's scowl deepened. "Are we still talking about the yeast?"

"Yes," Prax said. "Of course we're talking about the yeast."

"All right," the man said. "That's great, but what we need to know is who had access to that partition."

"What?"

"The partition you put the data in," said the Pinkwater woman. "Who could have linked to it from there?"

"Anyone with access to the workstations in the research group *could* have," Prax said. "What does that have to do with it?"

The man's hand terminal chimed, and he pulled it out from his pocket. The red backslash on an alert made him look almost like he was blushing, but when he put the hand terminal away, his face had gone pale.

"I have to step back," the Free Navy man said. "You finish this, yeah?"

His voice was tight. Prax thought he was shaking. The woman nodded and checked her own hand terminal. Prax watched him go, confused. Wanting, almost, to call him back and insist that they finish. This was important. This was his martyrdom in the cause of freedom and science. The interrogator couldn't just walk away in the middle of it. When the door closed, he turned to the woman, but she was still looking at her terminal. A newsfeed with something about the war.

She whistled softly, her eyes going wide. When she looked up at him, it was like she was surprised to see him.

"The yeast data," he said, reminding her.

"Dr. Meng, you have to be more careful. You can't do that anymore."

"Do what?"

The woman's impatient smile didn't reach her eyes. "You can't put data that might help the enemy into an open partition. I know it's proprietary, but someone leaked it, and we have an active investigation now into who that might have been."

"But— No, you don't understand."

"Dr. Meng," she snapped. "I know you don't like us coming in and telling you how to run your lab, but these are delicate times. I'm asking you to take a long, careful look at your lab's security hygiene so that we don't have a less pleasant conversation next time. You understand that?"

"Yes. Of course."

"All right, then," the woman said with the air of having won an argument. "You can go now."

Prax didn't know what to do. He sat quietly for a moment, waiting for clarification he didn't know how to ask for. The woman checked her hand terminal, looked back at him, annoyance in her expression.

"Dr. Meng? We're done for now. If we have any further questions, we'll find you."

"I should leave?"

"Yes," she said.

And so he did. Walking through the halls and up to the public carts felt like moving through a dream. His stomach felt empty. He wasn't hungry, there was just a massive bubble in his gut where something—pain, despair, hope, fear—was supposed to be. He rented a cart, took it to the tube station. The whole incident had been so brief, his shift wasn't even done. It would

be, though, by the time he got back to the lab. So he went home instead.

The newsfeeds on the tube were alive with whatever military action had been on the security woman's hand terminal. He tried to make sense of it all, but the words seemed to lose their meaning somewhere between the screen and his senses. He caught himself staring emptily at a young man sitting across from him and had to make a conscious effort to look away. All he could think was the dark-skinned woman saying *You can go now*.

Djuna was home when he got there, sitting on the couch with her head in her hands, her eyes bloodshot and her cheeks blotchy from crying. When he stopped in the entryway from the kitchen and lifted his hand in greeting, she stared at him for a moment, stunned, and then leaped up, ran to him, and wrapped him in her arms. After a long moment, he hugged her back, and they stood in their rooms, the way he never thought they would again.

"Leslie sent me a message," Djuna said, her voice still thick with tears. "She said they came for you at the office. That the security people took you away. I was trying to find a lawyer who would talk to me. I sent the girls to Dorian's. I didn't know what to tell them."

"All right," Prax said. "It's all right."

Djuna leaned back, searching his eyes like there was something written in them. "What happened?"

"I confessed," Prax said. "I told them ... I told them everything. And then they let me go."

"They did what?"

"They said I shouldn't do it again, and that I should leave," he said. "It wasn't at all the reaction I expected."

Chapter Forty-One: Pa

I've got fast-movers," Evans said. "Five, wait ... Seven."

"Coming from?" Michio asked, though she was already certain of the answer. The assaults throughout the Belt had already pulled the Free Navy's fighters to other conflicts, thinning the defenses at Pallas. She had to give Holden his due. He hadn't tried to use her and her ships as bullet sponges.

"Pallas Station," Evans confirmed. "No one's shooting out in the black."

"PDCs have them," Laura said. "Permission to fire?"

"You have permission," Michio said. "Oksana, evasive maneuvers at will. Let's show these fuckers we can dance."

"Yes, Captain," Oksana said between teeth bared in concentration and joy. A moment later, the *Connaught* lurched, shifted. Over the system, Josep howled a wordless battle cry.

The Four Horsemen, Foyle called them. The *Connaught*, the *Serrio Mal*, the *Panshin*, and the *Solano*—the most experienced of Pa's breakaway fleet. They fell toward Pallas Station from four different directions, spreading the local defenses as thin as they could. If there had been time, maybe Marco would have pulled resources off Pallas too, sabotaged the manufacturing infrastructure, and left anyone who couldn't escape on their own for Pa to rescue or let starve under her name.

But that assumed there was someplace for the Free Navy to run to.

"Two down," Laura announced. "Five to go."

"Sooner's better than later," Michio said.

Metal and ceramic creaking and singing from the strain, the *Connaught* turned and accelerated, then cut power and went on the float, whipping around to give the PDCs a wider field of fire. Laura's guns buzzed, vibrating the ship and killing three more of the station's torpedoes even as the *Connaught* sped in toward them flank-first. The surface of the asteroid glittered ahead of them, her target and her enemy and the home to tens of

thousands of the people she'd thrown her safety and career aside to help and protect.

"Keep the rounds from hitting the station if you can."

"Do my best, Captain," Laura said, but her subtext was clear—if it gets down to them or us, it's them. Michio couldn't disagree.

"*Panshin's* taking fire," Evans said. "*Serrio Mal* too."

"*Solano*?" Michio asked.

The *Solano* had taken the most damage in the raids and scuffles since she'd broken ranks with Marco. Enough that it was chosen to be the sacrifice ship, emptied of her crew and all useful material. It was the hinge point of her battle plan. Three of her ships to distract and disarm Pallas, to the point that, even if they shot it full of holes, they couldn't scatter the *Solano* into a debris field thin enough to keep the docks from crippling damage.

"Still far enough back it's not being targeted," Oksana said.

"Four more down," Laura said. "That last one's being a booger ... Got it!"

"Captain," Oksana said. "We're going to need to return to braking burn if we don't want to get very close and personal with the station."

"Do it," Michio said. "I'm taking comms."

"Understood," Evans said. "I've got another wave of torpedoes coming in. And we are nearing effective PDC range."

Michio set for broadcast. So close to the station, there'd be no light delay. Everyone listening would hear her almost as she spoke. After so long at high-lag distances, it felt odd. She considered herself in the camera as Oksana spun the ship and punched the deceleration. She started the broadcast.

"This is Captain Michio Pa of the *Connaught* to all citizens of Pallas Station. Be advised, we are here to remove the false governance of the Free Navy and return control of the station to its citizens. Evacuate the docks immediately. I repeat, evacuate the dock levels immediately for your own safety. We call on the Free Navy administration for immediate and unconditional surrender. If we do not have that confirmed in the next fifteen minutes, it will be too late to save the docks and shipyard. For your own safety, evacuate now."

The comms display threw up an error alert. Her signal was being

jammed. She boosted it as much as the *Connaught*'s transmitter allowed and set it to loop. She hadn't had much hope of a peaceful ending, but she'd tried.

The ship lurched again and burned hard, pressing her back into her couch. Laura shouted something obscene, but the ship didn't detonate. They'd dodged whatever it was.

"*Panshin* took a hit," Evans reported. "PDC. They look all right. The *Solano*'s still not top of the Pallas threat index." He paused, rechecked his monitor. "It's working."

"Thank you," Michio said. "Let's start taking out their PDCs."

"Already on it," Laura said. "Just as long as I can keep these torpedoes from flying up our ..." She trailed off, lost in concentration. Michio didn't interrupt.

This wasn't what she wanted. Wasn't what she'd ever wanted. She'd begun this whole fallen, fucked-up process because the dream of a Belt for Belters—a life that didn't depend on being used and exploited by the larger powers in the system—had meant something. And now here she was, fighting alongside Earth and Mars. Against Belters.

Three years, Sanjrani gave them. Three and a half. And then starvation. And she was about to break the docks at a major port so that James Holden could open the way to the colony worlds again and leave them all behind. This was what she'd agreed to do. It was her part in stopping Marco and trying to save the Belt, even if it was the Belt three years from now.

Every step along the way had made sense, except that they ended up here. Everyone she'd allied with her whole life had started by seeming to be good, competent, and loyal. They'd all disappointed. And now, she was going to do the same. She'd changed sides so many times, she didn't know who she was anymore.

If she changed the plan now, if she backed away ...

Fought the oppressor before. Still fighting the oppressor now. Followed your heart then. Still following your heart now. The situation changes; that doesn't mean you do.

Fuck.

"Evans," she said. "What's the status of the *Solano*?"

"On course, Captain."

"Do we have control of it?"

Evans looked over at her. His eyes were wide and uncertain. Panicky. “I have telemetry, yeah.”

“Slow it down,” she said, pulling up tightbeam connections to the *Panshin* and the *Serrio Mal*. “Give us more time to kill the defenses.”

Captain Foyle accepted the connection first, then a moment later, Rodriguez. In the separate windows of her display, they looked like negative images of each other. His pale skin, her dark, but with the same thinness and close-cropped hair. The images shook under different strains as the *Panshin* and the *Serrio Mal* suffered their own separate evasions.

“We have a change of plan,” Michio said. “The *Solano* isn’t ramming the station. We’re going to park it, ass-end at the ports, inside safety range, warm up the Epstein, and melt anything that comes out to slag. Blockade.”

Foyle’s eyes could have been cast iron for all that her expression changed. She’d be hell at the poker table.

“Con que?” Rodriguez said, his lips narrowing. “Is late à diffe the plan.”

“Late’s better than too late,” Michio said. “The Belters of Pallas aren’t the enemy. I’m not going to make them the enemy. I need slow passes from both of you. Every PDC gets dusted. Every gun and torpedo emplacement, we break. Then sensor arrays. I need this station blind and declawed.”

For a moment neither one of her captains spoke. She could hear all the objections in her own voice. She was tripling the risk of the mission. She was spending an order of magnitude more ammunition—torpedoes and PDC rounds—than a simple escort of the sacrifice ship required. She was putting them, her commanders and their crews and their families, at risk to preserve a station that was actively trying to kill them all.

“I need you to trust me,” she said. A loud pop announced a stray PDC round had holed the *Connaught*. Oksana shouted something about sealing the deck. Michio didn’t look away from the screen. Let them see these were her risks too.

“Dui,” Foyle said in her whiskey-and-cigar voice. “You say it, bossman, and we get it done.”

Rodriguez, shaking his head, muttered something obscene, looked into the camera with tired eyes. “Fine.”

She dropped the connection. When she checked in with fire control, Laura had already changed the profile. On the display, every weapon on the face of the station was marked in red, targeted for destruction. But not the

docks. Evans was out of his couch and pouring sealant on the hole where the PDC round had punched through the hulls. The slug had passed through the command deck maybe a meter from her head. She could have died. Any of her people could have died. Knowing it was like being two different people at once. One, horrified at the idea that it could have hit Laura or Evans or Oksana. The other, shrugging away what hadn't happened. This was the work. This was the choice she'd made, and it was the right one.

For two long hours, the *Connaught* dodged, strained, poured rounds down onto the surface of Pallas. What had originally been a fast, sharp attack turned into a long, bloody bout more about endurance and supplies than clever tactics. The *Panshin* and the *Serrio Mal* matched her blow for blow, hammer strikes against an anvil. The jammers were set too deep in the stone for even her torpedoes to reach, and every time the curve of asteroid cut off her line of sight to the other ships, Michio was afraid something would happen. That she wouldn't see them again. And once, the *Panshin* emerged from a long pass with a bright scar and section of her hull peeled back.

Slowly, a blindspot appeared around the docks. Parts of space leading to Pallas that had been defended, weren't. Evans brought the *Solano* into it kilometer by kilometer, then meter by meter until it had locked to Pallas' orbit with only an occasional little push from the maneuvering thrusters to keep it stationary.

"They're going to find a way to kill it, sir," Oksana said. "May take them days, may take them hours, but this isn't a blockade that can hold for long."

"Get me line-of-sight on the *Panshin*, Oksana."

"Sir."

Rodriguez, when he appeared on the screen again, was grinning. So that, at least, was a good sign.

"How's your ship, Captain Rodriguez?" Michio said, returning his smile despite herself.

"Esá bent, broken, fucked, flustered, and far from home," Ezio said, laughing. "Got a couple in the med bay and one in the morgue, but we done the thing, que sí? Pulled a whole station's teeth and half their eyes too, account son los *champions*."

"I think we are," Michio said. "I'm going to need you to stand guard on

this. Pull back far enough that you're out of range of anything Pallas puts together. Take control of the *Solano*."

"Babysit?" Rodriguez said.

"Got your hull pulled back like a condom wrapper, Ezio. I'm not putting you in at Titan."

God bless the man, he looked disappointed. "Bist bien," he said. "We'll hold the line. But you and Foyle take the torpedoes we've still got, yeah? Stock up. Anything we do, we can manage con PDCs and my winning smile."

"Won't say no to that," Michio said.

"Que tu trigger?" he asked. "When do I light it up and slag the fuckers?"

"When you know it's Free Navy you're burning down. Not if just people. Lose the ship before you hurt civilians. Killing people because they got in the way is inner-planets bullshit. It's Free Navy bullshit. We're better than that."

"Damn right we are," Rodriguez said and signed off. When he saluted, he had blood on his fingers.

She pointed a tightbeam connection request at one of the less damaged comm arrays, unsure if it would do any good. Even if the equipment was limping along well enough to function, there was no reason for the connection to be accepted. Only it was.

A familiar dark, pebbled face appeared on her monitor. From what she could see behind him, he was in a well-appointed office, brightly lit and probably somewhere deep enough in the station that she couldn't have reached him without nukes or a reactor set to critical and crashed into the station.

"Captain Pa," he said. "You seem to be moving from one shitty decision to another."

"Rosenfeld," she said.

"When you broke with Inaros, I understood it. Respected it, even. I was disappointed when you turned to Fred Johnson. But this? Playing marionette to Chrisjen Avasarala and Emily Richards. And Holden?" He shook his head. "Something happened to you, Michio. You've changed."

"Context changed," she said. "I'm still the same. And here's what happens next. I have a live, warmed-up Epstein drive pointed at the docks. If I see any activity there? I slag them. If I see any shuttles or boats taking

off from the surface, I'll shoot them down and slag the docks. If I see anything that looks like an attempt to sabotage the *Solano*, I'll slag the docks. If any Free Navy ship comes within a hundred thousand klicks of Pallas, I'll slag the docks. You will find yourself governor of an old, broken station that can't move supplies in or out."

"Duly noted," Rosenfeld said dryly.

There didn't seem anything more to say, but she didn't kill the connection. Not yet. And then, "Use this."

"Excuse me?"

"You're a political animal. Use this opportunity. I'm giving you an excuse to drop out of the fighting. You can tell Marco that I pinned you down. You won't even be lying. Even if he beats us all, you know he can't govern the system. And your plan?"

"My plan? What plan?"

"The one where you're the man behind the throne. The real power while Marco's the public face and figurehead. That won't work either. He can't be controlled. He can barely be predicted. I'm not blaming you. I made the same mistake. I saw what I wanted to see in him. But I was wrong, and you are too." Rosenfeld's face was unreadable and still. Michio nodded. "Do you know the magic word?"

"No," he said, his voice rich with disdain. "What's the magic word?"

"Oops. You should say oops, Rosenfeld. Own it that you made a mistake. That ship I have with its ass pointed at you? It's your chance to do something about the fact that you picked the wrong side."

"You want me to thank you for that?"

"I want you to make sure all the people in there get food and water, and I want you to keep them safe until this is over."

"And when's that going to be?"

"I don't know," she said, and dropped the connection.

For a long moment, she rested in her couch, held in place by the straps and the familiarity of the voices and sounds around her. Her jaw ached where she'd been clenching it. She had a bruise across her collarbone, and she couldn't remember which maneuver might have caused it. She closed her eyes, letting it all wash over her. Laura talking through the headset with Bertold about how many PDC rounds they had left. Oksana and Evans laughing over nothing, releasing tension, quietly celebrating that—on some

level, by some measure—they'd won. The smell of the portable welding rig burning off the emergency sealant and closing the punctures in the hull. Her home. Her people. She filled her lungs with them all.

The comm display chirped. A request from the *Serrio Mal*. She accepted it. Susanna Foyle appeared on her monitor.

"Captain Pa," she said.

"Captain Foyle."

"Rodriguez tells me we're not taking three ships to Titan after all."

"That's right."

"Used up a lot of ordnance on this mission that wasn't in the specs," Foyle said.

"Also true," Pa agreed.

"Going to leave us outnumbered and outgunned." It wasn't an accusation. Just an observation.

"We won't be the only ships there," Pa said. "We'll have backup."

For the first time, Foyle's face lowered its dignity to have an expression. "Squats and Dusters. No one we can count on."

"We're all in this together," Pa said, and Foyle coughed out a single laugh.

"As long as you're going first, we'll follow. Didn't get this far by taking the easy way. We've got our patches in place and our bandages on. You're ready to burn, then so are we."

"Thank you."

Foyle nodded, dropped the connection. Pa pulled up a system-wide tactical map with all the fighting that was going on throughout the system. A cluster of updates from Vesta. A chase between Free Navy fighters and a dozen Martian warships as Marco's forces tried to loop around toward Mars itself. The guard force left behind at Ceres tracking four Free Navy ships. The orbital defense of Earth on high alert, most of its patrol ships away from their posts and on the attack. The sum of all of humanity's presence in the solar system, bent on violence and spectacle. And at the edge of the display, almost off it, *almost* forgotten, the *Giambattista* and the *Rocinante*, already decelerating toward the ring gate, and two fast-attack ships burning hard to intercept.

Good luck, you bastard, she thought, putting her hand over the tiny gold dot marked *Rocinante*. *Don't make me sorry I trusted you.*

And then, over the ship-wide system, “All stations report. We’ve got another fight to get to. Don’t want to be late.”

OceanofPDF.com

Chapter Forty-Two: Marco

Son coyo, son *tod!*” Micah al-Dujaili shouted out from the screen. “You and all your ti-ti soldat! I am here for you, Inaros. What *you* did to my family.”

Marco muted the broadcast. Somewhere nearby, someone else was watching it. Al-Dujaili’s rant still nattering in the distance as the *Pella* rose off Callisto, a half dozen ships arrayed behind her. “Do we have target lock?”

Josie lifted a hand in affirmation, his eyes firmly on the monitor. They were only at a single g, but Marco felt a headache beginning at the base of his skull. It didn’t matter. It was only a little pain, after all. There’d be time to take something for it when his enemies weren’t wasting good air. Around him, the command deck of the *Pella* was tight and bunched. Josie with weapons. Karal at the comms. Miral muttering into his headset to someone down in engineering. They were wolves. A band of predators ready to strike. Al-Dujaili shouted something about vengeance. Something about betraying the Belt in the name of glory.

“Let’s shut this fucker up, then,” Marco said casually. “Fire everything.”

The warning had come to the Jovian system in time for him. Earth, Mars, the traitor Michio Pa, Holden. Naomi. All his enemies had lit their torches and hoisted their pitchforks for him and taken to the road. Marco wasn’t surprised. He’d known to watch for them, and when they came, he was ready. True, he hadn’t expected it to come from everywhere at once the way it had. The consolidated fleet had come boiling out of Ceres, up from Earth and Mars. They’d burned hard and taken some of the nearest of the Free Navy’s forces by surprise. But space and distance were Marco’s natural allies. It took time to burn across the half-billion kilometers from Mars, and the Jovian system was Belters’ land. And Belters meant Free Navy, no matter what yapping little pups like Micah al-Dujaili and Aimee

Ostman wanted to pretend. By the time their Earther allies made it to al-Dujaili's side, the man would be a corpse, and all the ships traveling with him dead at his side.

"Firing now," Josie said.

The *Pella* rang with the mechanisms of torpedo and PDC, the vibrations traveling through the hull and making the whole ship chime like a war bell. Marco could taste the sound—ice and copper. It was beautiful.

"Hoy, Captain," Karal said. "Got messages coming in. Other ships que savvy if they should be firing too?"

"Yes," Marco said. "Tell them all to open fire."

"The ones kommt de Ganymede too? Not in effective range, them."

Marco shifted to stare at Karal. The ache in his brain grew a degree worse. He'd known Karal for decades, trusted him. In his voice now, though, Marco heard doubt. More than doubt. Insolence.

"All. Fire. Let al-Dujaili spend his rounds plucking their torpedoes out of the black. It'll shut his nattering mouth."

"Dui," Karal said, turning back to the comms and speaking in a voice too low and urgent for Marco to bother listening.

It was happening everywhere. Vesta. Pallas. Titan. Hygeia Station. Thisbe Yards. Europa. Large targets and small, the enemy was coming at him thinking they would wash the Free Navy aside like a wave. And there was damage, yes. Pallas blockaded. Vesta fallen. The battle forces burning toward Titan alone might make one of the largest in history, and he couldn't say how decisive his victory there would be. It almost didn't matter. The important thing was that he had goaded them into action. Into reaching out in anger and fear. It was a recipe for overreach. After the careful, turtle-meek response of Earth and Mars to this point, it was a relief.

Let them come. Let them win their little victories. The Free Navy would hold what it could, scatter into the dark where that was wiser, and loop back to crush the unguarded targets left behind. It was the mistake he'd known they would make. The inner planets with all their centuries of dominion still dreamed that they could fight a war and win. Marco knew better. War was never won and never lost. Until now—until *him*—Earth and Mars had thought they were at peace because the violence had all poured out on the Belt and not back at them. Their fault. Their shortsightedness. They'd had their age of victory. It was over now. And this paroxysm, this grand mal

seizure of a battle plan, promised a thousand more like it to come.

The Belt would take its hits. But it would never take them passively again. That was his victory.

“First wave’s down,” Josie said. “They got all our torpedoes. No hits. Try again?”

“No,” Marco said. “We wait. Let them think they can handle us. Then crush them.”

“Bien,” Josie said. Karal muttered into the comms, passing the word along. Without the weapons fire, the ship still wasn’t quiet. It only felt that way. Marco stretched his neck, craning it to try to relieve the tension there, but everything in him was straining out toward al-Dujaili. He’d killed Fred Johnson with his own hands already, and now all the OPA factions that had been stupid enough to follow an Earther would see what crop they’d sown.

He pulled up the tactical display. The eight enemy ships led by al-Dujaili’s *Torngarsuk* were scattered enough to make taking two down with a single torpedo impossible, but near enough that their PDC fire could reinforce each other. For all al-Dujaili’s ranting and venom, he hadn’t lost his temper enough to abandon good sense.

The *Pella* and the six other Free Navy ships from the Callisto shipyards held a looser formation but a wider surface. Outnumbered for the moment, but with ten Free Navy ships on hard burn from Ganymede, they wouldn’t be for long. Marco grinned.

“Cut to a quarter g,” he said. “Tell the Ganymede ships to coordinate braking burns and watch close. If the enemy waits, we outnumber them. If they attack now, be ready to turn. Draw them out of their formation.”

“Bien,” Josie said. “Aber ... They’re firing.”

“Go!” Marco shouted, willing the *Pella* like it was part of his body. Like he could bend its path with pure force of his intention.

“At a quarter?” Karal yelled, and Marco shouted wordlessly and grabbed the pilot’s controls. Under his command, the *Pella* leapt forward, pushing him back. The hull creaked and groaned, but he saw Josie’s targeting solution feed in, heard the great and glorious rumble of the weapons, watched the arcs of PDC fire still too distant to pose a real threat but near enough to disrupt the enemy and then the spread of torpedoes. And the spreads from the others in his group. And far distant, but drawing close, a woven cluster thick as a rope—torpedo tracks from the Ganymede ships.

All converging, all falling in to the enemy. Fire and metal and blood. It was like joy. Like music.

He bent the *Pella*'s course, firing thrusters at a hundred percent or not at all, feeling the glorious torque of the turn in his blood and the aching pressure of his crash couch trying to hold him. Someone shouted, but Marco was past listening now. This was battle. This was glory and victory and power.

A proximity warning, and the *Pella*'s PDCs shifted automatically, splashing an enemy torpedo that had been lost among the cloud of converging fire. Marco laughed. His other ships had taken his cue, turning toward the *Torngarsuk*. One of al-Dujaili's ships misjudged, took a torpedo from the Ganymede ships in her side, and crumpled, venting air. One of Marco's ships lost a thruster to a torpedo, and three of the remaining enemy coordinated to mow it down with PDC fire like lions descending on a crippled gazelle. Even in that moment of loss and rage, Marco felt the joy of the fight.

It was ugly, brutal, direct. They were past clever solutions and elegant traps now. This was toe-to-toe throwing punches until someone fell to the ground. This was the urge that had put mankind on the battlefield with stones and lengths of wood, beating each other blood on blood on blood until only one side remained. And that side was Marco's. The Free Navy, and fuck all the rest.

The *Torngarsuk* died last, dancing around arcs of PDC fire while al-Dujaili shouted defiance and obscenity over the radio. And then didn't. The *Torngarsuk* lost power, drifted, and detonated. Its own tiny, brief sun. Marco fell back into his crash couch, aware for the first time in he couldn't say how long of the thrust gravity pulling at him. The tactical display showed two of the enemy ships fleeing. He hadn't noticed when they'd left, but it hadn't been recent—they were already far outside his effective range. Farther and faster with every breath. He smiled, noticed the taste of blood on his lips. He'd bitten his cheek. He didn't remember that either.

Slowly, his consciousness seemed to broaden. Not just his monitor and his couch and his body. There was an alert sounding somewhere. A smell of smoke and the bright scent of fire suppressants. His headache had bloomed without him noticing into a throbbing unpleasantness, and his hands felt like his fingers had bent backward and were only just coming back to true.

He looked around the deck. Josie and Miral and Karal, all looking back at him. He lifted a fist.

“Victory,” he said, and coughed.

But the victory came at a price. Two of his reinforcements from Ganymede were done, the crews dead, the ships hardly more than scrap. Three of the ships from the Callisto yards would need repair. The *Pella* had suffered a breakdown in the air recycler that was annoying but trivial. Enough that they had to land in the shipyard again for a few days while it was repaired and tested. Johnson’s lickspittle OPA had taken worse, died in greater number, but still, this wasn’t the sort of success Marco could afford many more of.

And add to the injury the insult of being lectured by Nico Sanjrani.

“This has to stop,” the little economist said from the screen. “The damage to infrastructure is getting worse, and the more the curve deflects, the harder—the more nearly *impossible*—it’s going to be to pull it back up.”

Marco, in the office he’d appropriated for Free Navy’s command on Callisto, leaned back in his chair, closed his eyes. The message had been sent with heavy encryption, its origin path and return hidden in layers of mathematics. All he knew for certain was that Sanjrani was far enough away that the light delay and the limitations of equipment kept him from a real-time conversation. For that, Marco was profoundly grateful.

“I can resend the analysis,” Sanjrani whined. “But this situation is making things worse than the numbers show. *Worse*. Whatever it takes to stop it, you need to do that. If we don’t start building a separate exchange economy soon—and by soon I mean weeks or months ago—we may have to reimagine the whole project. We may not be able to get away from inner-planet-backed scrip at all, and then we can be as politically independent as we want, only it will still devolve back to financial constraints by the inner planets, which was what we were trying to get away from in the first place.”

Sanjrani looked tired. Stressed. There was an ashy tone to his skin, and his eyes seemed sunken. Given that he was holed away somewhere safe from battle, it seemed more than a little histrionic. Marco stopped the

message—there was another twenty minutes in the spool—and composed his reply. It wasn't a long one.

"Nico," he said gently. "You give me too much credit. None of us have the power to control what atrocities Earth and Mars and their misguided allies in the Belt will commit to stop us. We can only hold to our principles and our dreams. We will absolutely prevail, in time. When the inners put down their arms and leave the Belt in peace, we will have the power to end this. Until then, our only options are to defend ourselves or let our people die. I won't compromise on that, and I know you won't either."

There. Thirty seconds to answer thirty minutes of alarmist maundering. That was what efficiency looked like. He sent the message back on its looping way, checked the newsfeeds—the battle at Titan was entering a second day with heavy casualties on both sides, and still too early to know what he'd won or lost in it—and the work reports on his ships—the *Pella* was ready to launch, but not with any size of escort for at least another three days—and then heaved himself up and walked through to the meeting room.

Whatever it had been before—engineers' workspace, security building, storage—the room was now the war council of the Free Navy. Karal, Wings, Filip, Sárta from the *Pella*. Captain Lister from the *Coin Silver*, Captain Chou from the *Lína*. They sat on white upholstered chairs, their uniforms lending them a formality. They stood and saluted when he entered the room. Except for Filip who nodded as a son to his parent.

"Thank you for coming," Marco said. "We have plans to make. This assault must not go unanswered. We have to mount a counterstrike and show the inners that we aren't intimidated. Show our strength."

A murmur of agreement passed through the room, no one actually speaking loud enough to be heard. Only not to be out of line.

Except, to his surprise, Filip.

"Another one?" his son said. "The last grand gesture did so well, que?"

Marco froze. The anger in Filip's voice—more than anger, *contempt*—was like being slapped. All around the room, the others went silent and still.

"Something to say, Filipito?" Marco asked, his voice low and calm and rich with threat. But Filip chose not to hear it.

"Yeah, something. We had this conversation before, yeah? Walked away from Ceres and said we needed to plan a show of strength. Counterattack.

Keep them afraid of us. We did this *before*, and now we're here *again*." Filip's face was flushed, his breath fast and heaving like he'd run to get here. "Only last time it wasn't *esá coyos la*, was it? It was Dawes and Rosenfeld and Sanjrani. And Pa, yeah? Inner circle. Heart of the Free Navy. Part of the plan."

"You're tired, Filip," Marco said. "You should go rest."

"How does this get different from last time you said it?" Filip said. "Tell me that."

Rage rose up in Marco's breast, filling his head with heat and fumes. He could smell it like a chemical fire.

"Want to know, me," Filip said, voice trembling. "This plan we've got. And the last plan before it. And the one before that. Which one's the real plan? Is there? Or are we just falling down and pretending we meant to?"

Marco smiled. When he stepped toward his son, Filip braced against a blow. Jaw tight. Hands in fists. Marco tousled his hair.

"Boys, eh?" he said to the others. "Boys and their tantrums. Captain Chou. Can we hear your report?"

Chou cleared his throat. "We have a few targets might serve," he said, pulling up his hand terminal and sending a data file to the wall screen. "Depends how it fits with the larger strategy."

Filip went white, his jaw jutting out. Chou went on talking, gesturing at the wall screen as he listed his suggestions and plans. Marco kept his gaze on his son and let the others pretend nothing was happening but the meeting. *If you act like a child, you will be treated like a child. Embarrass me and I will embarrass you.*

Filip swallowed, turned, and walked out of the room, shoulders back and head held high. Marco laughed as the door shut, just loud enough he was certain Filip would hear him.

He turned to the wall screen. "You don't list Tycho," he said. "Why not?"

Chou looked at his list, then back at Marco. "You want to take Tycho?"

"Why not?" Marco said. "These battles we're fighting now? They're the inners turning us against each other. Tricking us into killing our own. Belter against Belter, and for what? We can never win Earth and Mars over. They'll never see us as people. But Aimee Ostman? Carlos Walker? They should be on our side. Would be, if they weren't still stuck in a past that's

gone, gone, gone. Yeah?”

“You say it,” Chou said, nodding but dour.

“Tycho has always been a jewel of the Belt. A source of our pride and a symbol of our success. It’s why Fred Johnson squatted on it all those years. Now another Earther who thinks he’s the savior of the poor backward Belt. Why should we let James Holden keep what was never his?” Marco grinned and let the syllables drip out of his mouth. “*Tycho Station*. Gather up all the ships we can, and burn there in force before the inners can regroup. We’re faster than them. Smarter. And when we reach Tycho, we will see them rise up to greet us and toss Holden out the airlock, I will guarantee that.”

Lister cleared his throat. “*Rocinante*’s not on Tycho, though.”

Marco frowned. A little stab of confusion and resentment pricked his heart. “What?”

“Los dué ships we sent after Ostman’s ice hauler? *Giambattista*? No transponders, but came close enough they got drive signatures off the escort ship. Esá es la *Rocinante*.”

The room was silent. Marco felt something crawling up the back of his neck. All the years he’d kept quiet track of where Naomi was, what she was doing, and now she and her lover had slipped away without his knowledge. It felt like a threat. Like a trap.

“The *Rocinante*,” he said, speaking each word carefully, “is running escort on Ostman’s old, broken-down ice hauler?”

“Looks like,” Lister said.

Something was wrong with the air mix. Marco wasn’t getting enough oxygen. His heart was beating fast, his breath coming faster.

“Where are they going?”

Chapter Forty-Three: Holden

Inertia was one problem. Location was the other.

The *Giambattista* was a massive ship, hard to bring up to speed and hard to slow down. A testament to the inconvenience of mass and Newton's first law. It was already braking toward the ring gate, pouring out energy and reaction mass in order to bring it to an orbit matching the gate. Between those two datapoints—where it was going and how quickly it was shedding momentum to get there—the fast-attack ships knew within a narrow range of possibilities where they would be and when they would be there.

Holden's calculus was built from unknowns. How many gs could the *Giambattista* endure during a hard brake? How many of the ships she carried in her vast belly would fail under that strain? The cold equations of velocity, energy transfer, and relative motion could draw idealized curves to describe any number of scenarios, but experience added on a permanent and indelible *unless something unexpected happens, and then who the hell knows*.

"Best guess, Alex," Holden said. "What are we looking at?"

Alex rubbed a hand over his thinning hair and made a distressed chuffing sound under his breath. The galley smelled like chamomile tea and cinnamon, but Naomi and Clarissa were both empty-handed. The *Roci's* deceleration was about a g and a half, matching the *Giambattista*. It made Holden feel like he was tired even though he wasn't.

"If I was them," Alex said, "I'd plan to overshoot. Time my braking run so that I'd go by just before that big bastard out there got to the ring. Group both ships together, because there's an attack opportunity during that pass. Drop a shitload of torpedoes that could use my velocity as a boost, hope I got a few good hits in. Once I'd passed, my torpedoes would be fighting against my velocity instead of building on it, so I'd likely save my powder until I could kill off what was left of my speed. Then come back to finish up

anything that survived that first pass.”

“Sounds plausible,” Naomi said. “And what would you do if you were us?”

“Get to the ring as quick as I could,” Alex said, more quickly this time. “Make them hurry to catch up to us so that the loop back took as long as possible. Then use whatever that window was to get Bobbie and her forces in through the gate, let her take over the rail guns, and get our butts into the slow zone so she could splash those bastards when they got back.”

“Going to be unpleasant trying to keep the *Giambattista* alive once they get back,” Clarissa said. “Two of them. One of us. That boat’s a big target.”

“All right,” Holden said. “What about their drive plumes? If they’re braking toward us, how big a threat are they?”

Alex shook his head. “The speeds we’re looking at, if we get in their plume, we’ll be in their laps.”

Clarissa’s voice was small, calm. “If it’s a suicide mission?”

Alex sobered. “Well, ah, then ... Yeah, that would suck.”

“If we break the *Giambattista* with too hard a burn,” Naomi said, “we can still stage the attacks from out here. We’re already unloading the first wave from outside the gate. There’s no reason we can’t launch the second one from here too. The command crew can’t be much larger than the *Canterbury*’s was. We’ll evacuate them on the *Roci* if we have to.”

“Unless whatever we break interferes with us deploying the boats,” Clarissa said. “Then Naomi and I are out there with welding torches trying to pop Bobbie’s stuff loose when the attack ships get back, and everyone has a bad day.” It was weird hearing Amos’ idioms spoken in her voice. The two had spent a lot of time together, though. So maybe it wasn’t.

Holden rubbed his palm across the cool surface of the table. The weight of the moment pressed on his shoulders. “I’ll talk to Bobbie and Amos. They’re there. They can make our case. Cut the deceleration now, go on the float until the last minute, and then burn like hell to brake. Make them chase us.”

“Going to be hard selling that to Belters,” Naomi said. “My people aren’t fans of high g.”

“Alternative being torpedo strikes makes a compelling argument, though.”

Naomi shrugged. “It does.”

After that, the hours stretched. Sleeping would have been a good idea, but it wasn't possible. He hit the gym, pulling against resistance bands until the ache distracted him from the attack ships bearing down on them. But as soon as he stopped, it flooded back in on him. Wondering whether the enemy would target the *Giambattista* because it was the larger target or the *Rocinante* as the bigger threat. If the plan to take Medina would work. If it would work in time. What the Free Navy would do if it worked, if it failed.

If they won and the passage to the colony worlds opened again, what it would mean for the Belters, for Earth, for Mars. What the shape of human history would look like if the Free Navy beat them. Anticipation soured to anxiety and fear, and then impatience and back to anticipation again. Usually, the *Roci* was comfortable as an old shirt. Under the guns this way, he felt closed in. Claustrophobic. He couldn't quite forget, the way he usually could, that they were a bubble of air and metal in an unthinkably huge emptiness.

Naomi found him in their cabin after his exercise. Her hair was tied back, away from her face, and her eyes were calm and serious.

"Was looking for you," she said.

He waved a little gamely. "Present."

"You doing all right?"

"I don't know. Yes?" He held out his hands, a gesture of helplessness. "I don't know why I'm having such a hard time with this. Not like it's the first war I've started."

Her laugh was rueful and warm. She launched across the room, caught onto the handholds where she could look over his shoulder at the monitor. The two enemy ships on approach. The *Giambattista* and the *Roci*. A red field where the braking burn would start. A white line where the *Roci* thought the attack would come. The first attack. Violence reduced to spare and well-presented graphic design.

"You didn't start this one," Naomi said. "Marco did that."

"Maybe," Holden said. "Or maybe Duarte did. Or the protomolecule. Or Earth and Mars over the last couple of centuries of not giving a shit about the Belt. I don't know anymore. I feel like I understand what I have to do in the next ... I don't know. Five minutes? Maybe ten? Then after that, things get muddy."

"Next is enough," Naomi said. "As long as you always see the next step,

you can walk the whole way.”

She put a hand on his shoulder, her palm warm against his skin. He laced his fingers with hers and braced as she pulled herself down beside him. A simple maneuver they’d done a million times before. The long practice of trivial intimacy.

“I keep wondering if this was inevitable,” he said. “There are so many things we could have done differently. Maybe we could have kept this from happening.”

“We you-and-me, or we humanity?”

“I was thinking humanity. But you-and-me too. If you’d killed Marco when you were kids together. If I’d kept my temper and not gotten kicked out of the Navy. If ... I don’t know. If any of the things that got us here hadn’t happened, would none of this be happening?”

“Don’t see how it could.”

On the screen, the two enemy ships ticked closer to them while they shifted—not as quickly—toward the red warning of the hard burn. “I keep thinking it would have, though,” Holden said. “If it wasn’t me or you or Amos or Alex, if it wasn’t the *Roci*, it would be someone or something else. The Belt didn’t get screwed because of you or me. Whatever it was that made the protomolecule didn’t throw it at us because of anything that we’d done.”

“Seeing as we were single cells at the time.”

“Right? The details would be different, but the ... the shape of it all would be the same.”

“That’s the problem with things you can’t do twice,” Naomi said. “You can’t ever know how it would have gone if it had been the other way.”

“No. But you *can* say that if we don’t do something different, it’ll happen again. And again. And again, over and over until something changes the game.”

“Like the protomolecule?”

“It didn’t change anything,” Holden said. “Here we are, still doing all the same things we did before. We’ve got a bigger battleground. Some of the sides have shifted around. But it’s all the crap we’ve been doing since that first guy sharpened a rock.”

Naomi pulled herself closer, tucked her head against his shoulder. Probably people had been doing that since the dawn of time too, just not in

freefall.

“You’ve changed,” she said. “The man I met on the *Canterbury* wouldn’t have said that it was everyone’s business. That whatever anyone did counted.”

“Well. I’ve had really a lot of people shooting at me since then.”

“And you’ve grown up some. It’s all right. I have too. We’re both still doing it. That’s not something you stop. Not until you’re dead.”

“Mm,” Holden said. Then, “So I’m guessing this kind of thing doesn’t bother you?”

“Nature of history? No, it doesn’t.”

“Why not?”

He felt Naomi’s shrug against his body, familiar as if he’d done it himself. “I know what I need to deal with next. I’ve got two attack ships crawling up my ass, ready to kill me and all the people I love most in life. And if they manage it, my evil ex-boyfriend may very well grind all human civilization in the system into a new dark age.”

“Yeah. That guy’s an asshole.”

“Yup.”

They watched it coming, knew it would come. It didn’t make it any less frightening when it came.

Alex put the *Roci* just ahead of the *Giambattista*’s nose, offset enough not to melt her with their exhaust, but close enough to maybe stop the enemy torpedoes before they hit. The two incoming plumes were like stars—fixed and steady. Holden remembered being a boy in Montana, learning to catch a baseball. The way that the ball seemed to float almost motionless when it was coming straight for him. This was the same.

“Status?” Holden said.

“Sixty-three seconds to effective range,” Naomi said. “*Roci*’s watching them.”

Holden breathed out. The captain of the *Giambattista* insisted that her ship wouldn’t suffer more than three and a half gs, so that’s what they were at. The enemy was slowing at a little over eight, but still going so fast that

they would only spend a fraction of a second in range.

“Forty,” Naomi said, and coughed. A painful sound that made Holden aware of the weight on his own throat. Maybe they should have gone on the juice after all. Behind them, the ring gate would have been visible to the naked eye by now. Even a very low-power scope would be showing the weird, almost organic, moving-but-stationary nonmaterial of its frame. Signal was leaking through the bare thousand kilometers of its diameter, distorted like ocean waves seen from beneath—radio, light, all the electromagnetic spectrum, only warped and made strange. And beyond that, the rail guns waiting to kill them all.

“Starting to think this may not have been a great plan,” he said.

“Five seconds. Four ...”

Holden braced. Not that it was going to help, just that he couldn’t keep from doing it. On the external cameras, the enemy drive plumes grew larger, thicker, brighter, and then in a blink, faster than the frame refresh, they were gone and the *Rocinante* bucked hard around him, slamming him into his crash couch like he’d fallen off a ladder. The ship rang like a struck gong, deafening. For a confused second, he thought they’d been thrown around by the enemy’s wake. That they were going to capsize.

The *Roci* steadied. An alarm was sounding, brash and demanding.

“What have we got?” Holden shouted.

“I don’t know,” Clarissa shouted. “I haven’t been looking at this any longer than you. Just ... All right. Looks like we ate a couple PDC rounds or ... No, hold on. That doesn’t make sense.”

The alarm shut off. The silence seemed more ominous. Maybe the shaking hadn’t been the *Roci*’s maneuvering thrusters getting them out of the way. They’d been hit. They might be spewing out their spare air into vacuum.

“‘Doesn’t make sense’ is not good, Clarissa,” he said, trying to make his panic sound cheerful. “Something that made me feel like we weren’t dying would be really nice.”

“Well, we got a little beat up,” Clarissa said. “I thought it was PDCs, but ... No. We took out a torpedo close enough that we caught some debris.”

“They launched four torpedoes at us and two at the *Giambattista*,” Naomi said from behind him. “We got them all, but there was a little damage to both ships. I’m waiting to get a solid report from Amos.”

In that blink, Holden thought. That moment of shaking had been a whole battle too abrupt for a human mind to follow. He wasn't sure if that was amazing or terrifying. Maybe there was room for both.

"Not dying, though," Holden said.

"Not any faster than usual, anyway," Clarissa said. "I'll need to swap out some sensor arrays and plug a couple holes on the outer hull when we get a chance."

"Alex?" Holden said. "What's it look like up there?"

"I got a bloody nose," Alex said. He sounded affronted. Like bloody noses were something you got when you were a kid and beneath his dignity now.

"I'm sorry about that, but I was thinking more about the ships that were trying to kill us?"

"Oh. Right," Alex said, sniffing back the blood. "Like I said, that first window's closed. Anything they throw at us now, we can knock down easy. And it doesn't look like they're changing much about their burn."

"How long does that give us?"

Alex sniffed again. "We'll get to a matching point beside the gate in a little less than an hour. If our little friends do a straight-line burn to come back to us and don't change their burn rate? We'll have six and a half hours. If they loop around so they can come at us from different directions, a little more."

"What's the most?"

"Eight," Alex said. "Best-case scenario, we're going to need to get all our folks through that gate and under protection of our shiny new rail gun artillery inside of eight hours. Seven's more realistic. Six would mean we didn't have to sweat it."

"Amos is saying they got knocked around a little, but only lost some plating in the storage decks and maybe half a dozen boats," Naomi said. "Bobbie's calling it a win, and they're scrambling the first wave."

Between the three and a half gs and the violence of the *Roci's* defense, Holden's jaw and back ached. He couldn't imagine how unpleasant this had to be for Naomi and the Belters in the *Giambattista*. Including the first-wave team that Bobbie was about to lead down the enemy's throat. One wave to take the rail guns, then a second to secure Medina. By then, maybe he'd know what he needed to do next.

If it didn't work out, they'd try to keep the *Giambattista* and the OPA soldiers still on her alive long enough to come up with some other plan.

The ring gate grew larger on the scopes, looming up until they were so close, it dwarfed the ships. A thousand kilometers from one side to the other, and beyond it, the weird nonplace of the slow zone, the other gates, and the ruins of a thirteen-hundred-world galactic empire that humanity aspired to salvage. Naomi was right. It didn't matter whether they were servants of some greater historical movement or individual, disconnected lives suffering the consequences of their own choices. It didn't change what they had to do.

The *Giambattista* reached a minimum in their vector curve and shut down their drive. A few seconds later, the *Roci* did the same, but by then, the sides of the giant ship were already sliding open. In the starlight, the thousands of tiny cheap boats looked like spores being thrown to the wind by a dark fungus, visible more by the starlight they blocked than by any actual color or shape of their own. This close, the ring gate dwarfed them. He couldn't keep from seeing it as a massive milky eye, staring blindly down at a sun that was hardly more than the brightest star among billions.

The connection request came to his monitor. Bobbie Draper. He accepted, and her face appeared on his screen. Her powered armor made her unhelmeted head seem small. Voices behind her spoke in Belter cant so fast that he couldn't make out the words.

"First wave's ready to go," she said. "Permission to deploy?"

"Granted," Holden said. "But, Bobbie? Really, really don't die out there."

"No one lives forever, sir," Bobbie said, "but as long as it doesn't compromise the mission, I'll try to live through it."

"Thanks."

One by one, and then in ragged groups, the small, weak chemical rockets began to ignite. All of them together didn't have the power of the *Roci*'s reactor, but they didn't need it. Their whole lives were the space from the ring gate to the station in the center of the slow zone. For most of them, less than that. And only one of them had Bobbie and Amos and their ground force. As Holden watched, the boats shifted like a flock of starlings, became a single, moving shape on an imaginary, tactical wind, and burned toward the gate.

And then through it.

Chapter Forty-Four: Roberts

She'd known it was coming. Even before they'd pried the specific information out of Jakulski, she'd known *something* was coming. It was a feeling that came up like a bad dream she couldn't shake. A premonition or just the kind of fear that seeped through anytime she had something important and too clear an imagination about how it would be to lose it. Knowing that the war was coming to Medina was almost a relief. At least she knew in broad strokes what to be afraid of.

The fear had made small changes feel large. When Jakulski brought them the news that their work schedule was shifting, Roberts couldn't keep from interpreting each change like tarot cards. Tracking down the signal drop on the interior of the drum was pushed off for a month, so maybe Captain Samuels thought it wasn't important for defense from the invasion. The retrofit of the water supply for lower g moved up, so maybe they wanted extra capacity ready in case the environmental systems were damaged. They spent a day installing redundant comm lasers so that they could always have a tightbeam line to Montemayor and the rest of Duarte's advisors and guards on the alien station. Everything that she could fit into the idea of fortifying against coming violence became more evidence that her fear was justified; the more evidence she had, the easier it became to see things as further proof.

It wasn't only her, either. The others in her workgroup were all suffering from the same dread. Jakulski was gone more often than not now, not supervising them except to tell them at the start what to do and ask at the end if they'd done it. And when he did come out after shift, he left early without giving any excuses beyond *Things need doing*. Salis was drinking more, showing up for shift hungover and angry and then not wanting to head back to his quarters when the day was done. Vandercaust ... well, ever since the false alarm with the mole, Vandercaust had been a smaller man.

Not in his body, but the way he moved through his life. Careful, amenable, tucking into himself like a snail. Once, just after they'd heard about the ice hauler burning out toward the Sol gate, they'd been in the bar when some young coya, drunk off her ass, had started off shouting about how the colony planets didn't deserve aid or attention. *They don't like being treated that way, they shouldn't have done it to us and They're just as bad as Mars only without the stones to back it and Come back five generations from now and maybe we'll be close to even.* Vandercaust had finished his drink fast and left without saying goodbye. Anything political got his back up now, even if it was something they all agreed with.

And still, Roberts found she needed the company. When the leaks and rumors got bad enough that Captain Samuels had to make an announcement—*Enemy ships associated with OPA factions outside the Free Navy are sending a large cargo ship and escort. We don't know their intentions. The Free Navy has dispatched fighters to back Medina up, but with the fighting so hot in the system, it is a minimum force.*—Roberts was almost relieved. At least they could talk about it all openly now and not get Jakulski's balls in a vice.

When the enemy was on close approach to the far side of the ring, all the work on Medina ground to a halt. There were schedules and lists and work reports, but there were also enemies at the gate. Jakulski didn't show up to give them their daily orders, and even their freedom seemed ominous. They shifted to a bar where the wall screens were set to a local security newsfeed—the latest on the siege of Medina Station as it happened.

Diagrams of the positions of enemy ships and their Free Navy defenders. Analysis of who Aimee Ostman and Carlos Walker were and why they hadn't joined the Free Navy. Confirmation that the escort ship was James Holden's *Rocinante*. Beer. Dried tofu with wasabi powder. The camaraderie of the mob. It felt almost like gathering up to watch football, except their home was the pitch, and loss would mean the deaths of more than only people. The autonomy and freedom the Free Navy promised was balanced on the head of a pin.

"Did they get them?" Salis asked breathlessly. "Did we kill them?"

Roberts reached across the table, grabbing his hand and squeezing, waiting for the feed to update. For fresh information to come through. There wasn't any romance in the gesture. Not even a sexual invitation.

There just wasn't a better way to express hope and fear and oh holy shit all at the same moment. Across the bar, three dozen people—maybe more—stared at the thick, confused images bleeding through the gate. If it hadn't been a live image, it could have gotten cleaned up almost to where the gate's weirdness didn't show at all. But jagged and bent right now was better than clear as nothing later on.

A flash of the *Rocinante*, blooming fire-bright. The whole room took in its breath. Waited. But when the glow faded, the enemy was still there. Salis spat out an obscenity and let her hand go. On the feed, the Free Navy attack ships were already gone, carried off into the black by their own rush to get to the *Giambattista* and *Rocinante* before they'd reached the gate. For all the fucking good it had done.

"Es bien, es bien, yeah?" Vandercaust said. "Took a shot, bruised them. Make them rush is the thing. Keep them from going slow, being careful."

"You don't know what they've got on that ship," Roberts said. "Could be anything."

Vandercaust nodded, took a bit of tofu between his finger and thumb and squeezed it until it cracked. "Whatever it is, we'll put rail gun rounds through it until it's dust." He held out his green-powdered thumb like he was demonstrating the idea of dust. She nodded so tight and fast it was more like rocking back and forth.

"Dui," she said, wanting to believe it. Needing to. On the feed, the looming mass of the ice hauler had come to a relative stop on the far side of the gate and just off to the side where the rail guns couldn't fire through at it. So they knew that the defenses were there and to keep their heads down. That was too bad.

"What are they doing?" Salis said, not expecting an answer. In the feed, a hundred faint new stars bloomed around the ice hauler, wavering and inconstant. Then a thousand. Then double that. Roberts felt some part of herself step back, shock pulling her away from herself.

"Mé scopar," she breathed. "Are those *drive plumes*?"

The dots of light surged, all moving at once. A swarm of bright wasps, swirling, curving, and passing through the ring gate and out into their space. Her space. Here and there, a light flickered and died, one of the thousands sputtering and dying, but most flowed around each other, flight systems taking in the situation—their position, the alien station, Medina, the rings.

There were safe spaces where the rail guns wouldn't fire. Not behind cover, because apart from Medina itself there was nothing in the slow zone to hide behind. But the rail gun rounds wouldn't stop once they passed through the tiny attacking ships. Any of the enemy that could put themselves between the end of a rail gun and the ring of a gate or Medina itself would be safe. At least until the PDC and torpedoes of Medina Station could reach it. Like slivers of iron showing a magnetic field, the swarm burned for the lines defined by geometry and tactics. Or, most of them, anyway. The few that had failed spun helplessly in the void, threatening no one. And others ...

"Those fast-movers aren't ships," Salis said. "Those are torpedoes."

Roberts' hand terminal alerted in the same moment as Vandercaust's and Salis'. She was the first to pull hers from her pocket. The screen was red-bannered. The battle alert. She acknowledged, reporting her position. The assignment put her in a floating damage-control team. Jakulski and the rest of the higher powers in technical were waiting to see where they were needed. Where the damage came. It was worse than a hard assignment because her blood was fizzing with the need to flee or fight, and there was nowhere to go. If she could have run to a post, she'd have been able to pretend that she was doing something. That she could affect the wave of destruction flying toward her.

"Ah!" Vandercaust said. "There we go!"

On the wall screen, the rail guns had opened up. At first, it was only motion, the emplaced barrels—her barrels, the ones she'd put in their housings—quivering. Then the newsfeed overlaid the paths of the rounds, bright lines that vanished as quickly as they appeared, and with each flicker one of the enemy died. Roberts felt her jaw starting to ache from clenching it, but she couldn't relax. Salis grunted, his expression dismayed.

"Que?" Roberts asked.

"Wish we weren't doing, that is all," he said.

"Doing what?"

He gestured to the wall screen with his chin. "Sending stuff out past the gates. To where it goes away."

She knew what he meant. The starless nothing—not even space—on the other side of the gates was eerie when you thought about it too much. Matter and energy could be converted into each other, but not destroyed. So

when something that went out beyond the sphere of the slow zone seemed to vanish, it had to go somewhere or be changed into something. But no one knew what.

“No option,” she said. “Esá coyos making us.”

“Yeah, it’s only ...”

Long, terrible minutes stretched. Roberts fell into something half panic and half trance. The lines flashed on the feed. Another dead enemy. Another slug of tungsten accelerated out of reality and into the blackness stranger than space. Now that she saw it through Salis’ eyes, it made her nervous too. It was so easy to forget the profound strangeness all around them. They lived there, it was their home, so of course they had to defend it. But it was also a mystery they lived inside.

The timelessness of her attention and focus broke as a shudder passed through the incoming swarm, and her heart doubled its beat. A swirling motion that went through the drive plumes even as they winked out. The muttering in the room got louder.

“How fast they *burning*?” Vandercaust said, awe in his voice. He switched his hand terminal from the alert screen to a tracking program, streaming the data into it. “Esá can’t have crew on. Jelly and smash if they were, juice or no juice.”

Medina shuddered. The vibration was small but unmistakable. The first of the enemy were inside effective range. On the feed, the flicker of the rail guns was joined by slower, sweeping arcs of PDC fire, the bright pinpoints of Medina’s own torpedoes. Roberts found herself muttering curses like they were prayer, and didn’t know how long she’d been doing it. The flickers of enemy drive plumes began to thicken and coalesce into a single bright shaft, drawing a line between the alien station and Medina.

“They’re getting between us,” she said. “They got to stop them, they’re getting between us. They’re going to get here. They’re going to board us.”

“No one on them to board us,” Vandercaust said again. “No es ships, those. Fists with engines to push them is all. Rams.”

“We’re still picking them off,” Salis said. “Look, rail guns still firing.”

It was true. The shots were careful, dangerous. They slid past Medina’s drum so close Roberts imagined she heard them hiss on the way past. But the enemy kept dying, exploding into scrap and vapor. The wave of enemy torpedoes was already gone, turned to debris and bad intentions. And the

ships, closer and closer but fewer every minute.

“We’re taking hits,” Vandercaust said, glowering into his hand terminal.

Roberts pulled up her own terminal. Pressure loss on the outermost layers of the drum. Not everywhere, but scattered. A hall here, a warehouse there. A water reservoir was holed, throwing mist and ice out in a pinwheel as the drum spun it away. The Mormons had built the outer parts of the drum thick against the hard radiation of space. But no one was dying. Not yet.

“How are they hitting us?”

“Dead scraps,” Salis said. “It’s the debris from the torpedoes. It’s nothing.”

It might have been true that it was only debris, but it wasn’t nothing. As she watched, another alert opened, was flagged, assigned out. Her team wasn’t called yet. Wouldn’t be, she thought, until the bombardment stopped or something important enough to be worth risking all three of their lives took a hit. Around them, the other people cheered, and she looked up to see a spreading sphere in among the fading swarm. They got a big one, and the detonation had been enough to knock out a few of its nearest neighbors.

The thousands of wasps were fewer now. Two, maybe three hundred, and fading by the moment. The ones there were diving hard for Medina, dodging arcs of PDC fire, fleeing from the torpedo strikes, slipping outside their corridor of safety and being ripped apart by the rail guns. As the glittering lights fell to black, Roberts felt something in her gut and her throat. The laughter came out as barely a chuckle, but warm and full as tears, and grew to something deep.

They had come to take Medina, and they were failing. Yes, the station was taking its hits. Yes, they would be bloodied. But they would not fall. Medina was Free Navy now, and it would be Free Navy forever. Salis was grinning too. All around them, cheers started to go up with every rail-gun strike that plucked away another invader. Of them all, only Vandercaust seemed uncertain.

“Que sa?” Roberts asked him. “Visé like you’re trying to rub your asshole with your elbow.”

Vandercaust shook his head. Another flicker from the rail guns, another light gone out.

“Keep drifting, them,” Vandercaust said. “Visé. They’re in the shadow,

yeah? Station's far enough away the rail guns can cover them and us with the same thumbnail. But then they ... drift. Get where the rail guns can pick them off. What for they *drifting*?"

"Who cares, as long as they all die?" Salis said around a mouthful of grinning.

"Maybe they want to get killed," Roberts said. Joking. She'd only been joking.

The words hung there, floating over the table like smoke pooling when the luck was about to turn. She shifted her attention back to the screen, her joy and relief gone like they'd never been there. Cold washed her lungs and heart, a totally different fear than the tenseness and anxiety of the run-up. Another ship that should have died under Medina's PDCs or torpedoes died to a rail gun instead.

"What am I looking at, Vandercaust?" Roberts said, her voice hard but trembling. Vandercaust didn't answer, but hunched over his hand terminal, working it furiously with his thick, workman's fingers.

Another ship. Another. Less than a hundred of the enemy left, and they were peeling away like a flower blooming. Not even trying to keep course for Medina. All around, the room erupted in shouts and celebration. Over the cacophony, she barely heard Vandercaust say *Shit*.

She asked the question with her hand, and he passed the hand terminal to her. Already, the start of the battle looked like something out of history. The thousands of drive plumes flooding through the ring gate. Most—almost all—falling hard toward Medina.

Almost all. But a few failed. Their drives stuttering. Maneuvering thrusters blinking, throwing them into rough, cartwheeling spins. She remembered seeing them, discounting them. The enemy was so many, so cobbled together, so among the thousands, there were a few malfunctions. It only meant a handful they didn't have to worry about.

Except Vandercaust had flagged one. It glowed blue on his display as the battle proceeded. The rail guns turned toward the torpedoes that threatened Medina. The rounds spitting out. The enemy dying. But not the little green malfunction. It drifted, tumbling and dead.

Until it didn't.

When its drive burst back into life, it wasn't flying for Medina or retreating back for the Sol gate. It darted toward the alien sphere. The blue,

faintly glowing artifact at the center of the slow zone where all their guns were placed. Roberts was trembling so hard now that the green dot seemed to dance in her hand, leaving bright traces behind it. A jittering afterimage of how they'd been tricked. Thousands of boats and torpedoes arcing through the vacuum like a magician's gesture meant only to pull the eye. And God damn, but it had worked.

She handed back the hand terminal, plucked up her own, put in an emergency connection request to Jakulski. Every second he didn't answer felt like another clod of dirt landing on her coffin. When he did appear, he was in the administration offices, outside the drum and on the float. His sated grin told her that even Captain Samuels hadn't figured it out yet.

"Que hast, Roberts?" Jakulski said, and for a moment, she couldn't talk. The longing to be in the world Jakulski and all the others around here were in—the world where they'd won—was a lump in her throat. The words wouldn't fit past it.

And then they did.

"Get a tightbeam to Mondragon," she said.

"Who?"

"No. Shit. Montemayor. Whatever la coyo la's name is. Duarte's people. Warn him. Warn all of them."

Jakulski's brow furrowed. He leaned closer to the camera, though where he was there was no pull to lean into. "No savvy me," he said.

"Consolidated-fleet jodidas just landed on the *other* station. They were never after Medina. They were coming for the rail guns."

Chapter Forty-Five: Bobbie

Regret coming along?” Bobbie asked, shouting over the noise of the boat.

Amos, across from her, shrugged and shouted back. “Nah. It’s all right if the cap and Peaches get a little time together. Helps ’em get used to each other. Besides, this is fun too.”

“Only if we win.”

“That is more fun than losing,” he said, and she laughed.

The boat was crap.

Once, it had been a cargo container. Not a real one either, built to standards for a mech or an automated dock to handle along with thousands of others with the same dimensions and handholds and doors. This had been a custom job, cobbled together in the Belt out of equal parts scrap and ingenuity. The second hull was added later, the welds still bright at the corners. The crash couches weren’t actual couches, just thick sheets of gel glued to the walls with straps like climbing harnesses to hold their bodies against it. Add to that the fact that they had no active sensors, that they were on the tumble, that the dozen men and women with them were indifferently trained, that probably more than half of them had been involved in conspiracies against Mars and Earth in the not so distant past, that their weapons were old and their armor a collection from half a dozen different sources. And, of course, that if the enemy rail guns took notice of them, the first warning they’d have was that they were all dead. Bobbie should have been in a panic.

She felt like she’d just lowered herself into a warm bath. The anxious gabble of the soldiers might be in the mishmash polyglot of the Belt. She might only be able to follow half of it. She knew what they were saying. Antinausea meds kept the complex spinning of the boat from turning even less pleasant, and their bitter aftertaste was like coming back to a house she’d lived in when she was young. One rich with good memories and

familiar places. She liked the *Rocinante* as much as anyplace she'd ever been since Ganymede. They were good people, and even in a weird way they were her friends now. The soldiers all around her weren't and would never be that. They were her command, and even if it was only for a moment, she felt like she was exactly where she belonged.

Her suit speakers chirped. Communications were the one active thing she'd decided would be worth the risk. Now it was time to find out if that had been a good call. She accepted the connection with her chin.

A burst of static, followed by a weird fluting sound, like wind blowing across the mouth of a bottle, static again, and then Holden's anxious voice. "Bobbie? How's it going in there?"

"Five by five," she said, checking the exterior cameras to make sure that was true. The blue glow of the alien station rose up from the bottom of her visual field and curved off to the left. A glittering star field of rockets. A glimpse of Medina Station looking smaller than a beer can. The proximity readings had a dual countdown: one for the moment they passed inside the arc of the rail gun, the other for when they'd slam into the station itself. They were both spooling down quickly. "We'll be on the surface in ... three minutes."

"Are the troops ready?"

Bobbie chuckled and added the group channel in. "Hey. You assholes ready to do this?"

The cheer that came through maxed out the speaker. She slid back to the connection to the *Rocinante*.

"Good answer," Holden said, but tightly. The fluting sound again. Distortion from the ring. She hadn't felt anything moving through it. No discontinuity or sense of vertigo. It did manage to fuck with sensors and comms, though.

"The mission's on track, sir," she said. "We'll get control of the guns and get you in here."

"Alex is saying the attack ships have vectored past zero. They're heading back in our direction now."

"We'll do it quickly," Bobbie said.

"I know," Holden said. "Sorry. Good hunting."

"Thank you," Bobbie said, and the connection dropped, the comm indicator going to red. She went back to the exterior cameras, switched to a

corrected view. The image was steady this way, the tumble of the boat only showing in three jagged blind spots that sped through it like cartoon bats. There were fewer of the decoy boats now, but not none. And they'd made it in close enough that the station was blocking all but two of the rail guns. As long as those two didn't decide they were as interesting as the torpedoes and empty landing craft speeding toward Medina, they'd be fine. Except ...

She grabbed the image, enlarged it. There at the base of the nearest rail gun emplacement, a dozen meters from the massive sky-pointing gun, a low, gray structure. Round as a coin, and sloped so that no matter what angle debris or outgassing struck it from, it would be pressed more firmly in place. It was a design she knew inside and out. She waited for the fear to come, but all that showed up was a grim kind of determination.

"Amos," she shouted, sending him a copy of the image. "Take a look at this."

The big man looked at his hand terminal. "Huh," he said. "Well, that complicates things."

She popped the group channel open.

"New information. The intelligence we had that the rail guns weren't guarded may have been faulty. I'm looking at an MCRN-design troop bunker right now. If there's one, there may be others."

A chorus of alarm and regret. Bobbie switched the channel controls, killing all the mics but hers.

"No whining. We knew this was a possibility. If you don't want to participate, feel free to leave now. Otherwise, check your seals and weapons and be ready for a fight when we hit surface. Our job is to get control of those guns."

She enabled their mics in time to hear a ragged chorus of *yes sirs* and one woman's voice calling her a bitch. If there'd been time for a lesson in discipline, Bobbie might not have ignored it, but hey. It was a high-stress environment and the OPA soldiers weren't marines. She'd work with what she had.

Following her own advice, she ran a weapons check. Her arm-mounted Gatling gun read a full mag, two thousand rounds of mixed armor piercing and high explosive. A single-use rocket launcher was hooked to a hard point on her back, and slaved to her suit's targeting laser. Powered armor at full charge. She didn't doubt that she was the single most dangerous thing

on their little landing craft. That meant she'd be taking point.

The boat informed her that they'd passed beneath the rail gun emplacement's range. The computer started the maneuvering thrusters on their correction burns to stop the tumble and lit the main drive. The braking burn pressed her hard into the gel. Her vision started to tunnel, and she had to remind herself to tense her legs and arms, force the blood out of her muscles and into her brain. They still called it the slow zone, but the only actual speed limit there now was not getting crushed to death by the energy of stopping.

The boat hit hard, bounced, and hit again. Before it had stopped sliding, Bobbie had pulled her straps off and hit the button that blew the door completely off the ship. They wouldn't be using it to leave, no matter how things turned out. The landscape outside was as surreal as something in a dream. A plain of blue purer than a Terran sky, featureless and glowing. It cast shadows up across the ship, across her soldiers. Everyone's legs and crotches bright, their faces and shoulders in darkness.

A thick band of metal-and-ceramic almost a meter high stretched out ahead of her like a low wall, disappearing over a much-too-close horizon. The rail gun, its base hidden by the station's curve, rose up toward an eerie starless sky. She could hear the throb of its firing as static on her radio, feel it like a change in the air pressure or a sickness just coming on.

Bobbie had seen video feeds from the slow zone. She hadn't been prepared for her own sheer animal rebellion at how uncanny it was. Even in the most designed architectural spaces she'd seen—Epping Cathedral on Mars, the UN building on Earth—there was a sense of nature. The station and the ring gates out beyond it weren't like that. They were like a ship, but unthinkably huge. It was that combination of size and artificiality that brought the hair up on the back of her neck.

There wasn't time for it now.

"We've got no cover," she barked. "Spread out. Make it hard for the bastards to get us all. Now! Go!"

They jetted forward in a broken line, their suit thrusters more than enough to defy the barely perceptible gravity of the eerie blue sphere. Good tactics, moving in a hard to predict ragged line like that, even if it came more from a lack of discipline than from a plan. Ahead of them, a dark line on the horizon. A second wall to match the first, converging at the rail gun.

Just beyond it would be the low blister of the bunker. She could hope they hadn't noticed her make landfall. That she could get her engineers to the base of the rail gun and cut into the control systems before the enemy knew she was there ...

"Heads up," Amos called.

The first enemy fire came when they were still twenty meters from the corner where the walls converged. Enemy troops in what looked like Martian light armor crouched low to use the wall as cover, aiming down at them. Bobbie's heart sank. The enemy knew she was there, and were in position. Charging the walls, getting to the base of the rail gun. They'd be killed before they managed it.

"Fall back," she snapped, then squeezed off a few hundred rounds along the top of the wall. The faces peering over disappeared. Some dead, some ducking, no way to know how many of each yet. The OPA soldiers followed orders, though. No one tried to stay behind and play the hero. The only cover she could be sure of was the curve of the station itself. Bullets flew past her. Where they struck the station, the blue showed streaks of yellow, bright as sparks that faded slowly back to blue. The rail gun was still spitting.

Once the station's curve had hidden the far wall, she jetted to a stop near the boat they'd landed in, and floated up until just the very top of the wall was visible above the curve of the station. She zoomed in, setting the optics to a high-contrast false color that would make any movement stand out like neon. Soon enough a shape moved. Someone emboldened to poke their head up for a quick look. She fixed on it, fired. It disappeared. Dead or ducking? No way to tell, that damned wall of metal in the way. The curve of the station protected her, but it also protected them. The other Martians. The ones, she was certain, who'd betrayed their world and armed the Free Navy. Was it so much to ask that one of them would get careless and come close?

Amos followed her lead without being told, and the others came behind him, hauling themselves up well behind her where the enemy rounds didn't reach and then crawling forward. The steel curve the enemy had looped around the station was wider than it was thick—eight meters across at least—plenty of room to lie on. They could move forward, push the enemy back centimeter by centimeter. Unless they were themselves pushed back. Unless the traitorous Martians had a boat of their own that could skim overhead

and lay them all to waste.

She gestured to keep their eyes forward and tried opening a connection to the *Rocinante*. The static seemed thicker now, ticking along in time with the rail gun fire. But then the weird fluting sound and Holden on the other side of it like she was seeing him through a veil.

“How’s it going there, Bobbie?” he asked.

“It’s shit,” she said. “We’re encountering well-armed resistance in a fortified position.”

“All right. How long is it going to take you to get past them? I’m only asking because we’re looking at those fast-attack ships getting back here in a little under two hours, and it would be really great if we weren’t here when they did.”

“That’s going to be difficult, sir,” Bobbie said. The flickers of muzzle flash told her that someone on the enemy side had tried taking a shot, but they were gone again by the time she looked. “In fact we could use a little air support.”

“Don’t know how we do that,” Holden said.

Naomi broke in on the line. “We’ve lost essentially all of the decoy fleet. Anything still flying would be chewed to kibble before it got to you.”

“All right,” Bobbie said. “I’m open to suggestion at this point.”

Amos waved at her and pointed forward, toward the shifting pillar of the rail gun. She switched to a private connection with him.

“What about the power source?” he said. “These rail guns take a lot of energy to drive them and more to cool them off. And they’ve been going nonstop since we came through the gate. They’ve got to have a fusion reactor somewhere supplying the power. Maybe something salvaged off a ship. Maybe a couple truck-backs.”

“Where would I find it?” Bobbie asked.

“If it was me, I’d put it right under whichever one of those surrogate cocks they figured was least likely to get shot at. Or they could all have their own.”

She switched back to the *Rocinante*.

“What’s going on?” Holden said. “Is Amos okay?”

“We’ve got something. I’ll report back,” Bobbie said, and dropped the connection. She waved the soldiers forward, switched to the group channel. “Hold this ground. Keep their eyes and attention here.”

“Sa sa,” one of them said. She didn’t know which. “How long we need to keep it?”

“Until I get back,” she said. *Or for the rest of our lives*, she added silently as she burned back toward the fallen boat.

The door had been blown completely off, and the hull was dinged to shit where they’d slammed it into the station. But she didn’t need it to be pretty. She just needed it to fly, and it could still do that, at least for a little while. When she lifted away from the surface of the station, a few of the enemy took shots at her. Pointless with normal arms. The hulls might be cheap-ass crap, but they were cheap-ass crap meant to live through micrometeor strikes. The roar of the engine was just a vibration in her suit. She was leaving her people behind, and it killed her a little bit to do it. But it was the right call. There wasn’t time to hesitate.

The station curve was so tight, she had to work to stay tucked in close to it. The rail guns knew about her now. If she poked her head up, they’d chop it off. She thumbed on the full sensor array as she sped, touring the station as quickly as she could. They’d circled the station like three belts around a basketball, a rail gun placed wherever the steel bands intersected. It wasn’t hard to find them. Each of them was radiating heat as quickly as it could, maxing out the IR sensors in a way she’d never seen. But one—the one opposite the Sol gate—looked a bit hotter. If there was a single main reactor, that was her best bet. She set the little boat’s course, overrode the proximity shutoff, and as soon as she felt it duck down in its final kamikaze burst, she undid her straps and jumped for the airlock.

If it had been a real drive, the plume would have killed her. Instead, every temperature alarm on her armor went off at once. Her faceplate went opaque. A seal in her arm popped, sucking the skin around her elbow painfully until the secondary inflated and pressed down. For one terrifying second, she drifted above the station, blind and vulnerable. When vision returned, she could see the white bubble of the enemy bunker, and the twinkle of their muzzles as they fired. Bobbie painted the bunker with her targeting laser and launched the rocket on her back while at the same time firing her suit’s thrusters toward the surface as fast as they’d take her. She hit the surface of the station harder than she’d meant to, jarring her teeth hard enough she tasted blood. There was one bright flash as the rocket detonated, but it was quickly overwhelmed by the second flash of their

landing boat slamming into the rail gun's reactor.

Her faceplate went opaque again, but instead of the midnight black she'd suffered in the fire of the drive plume, it glowed a mottled brown. The radiation monitor flashed a red trefoil alert at her. But what fed her raw, animal panic was the wind. A thin, fast whistle of gas rushed past her, pushed her off from the surface.

When, seconds later, the faceplate cleared, a glowing cloud was expanding out from just beyond the horizon, a nebula slowly going dark. The surface of the station wasn't blue, but an angry acid green.

Oh, Bobbie thought as the station began to strobe green to white to black to green again. *This might have been a really, really bad idea.*

To her left and right, the steel bands around the station were wrong. At first, she wasn't sure how, but then she made out the gap between the steel and the surface, like a ring a size too large for the finger it was on. She switched to magnetic and IR, but they'd both burned out in the backslash from the reactor failure. The station shifted slowly back toward blue. She had the irrational sense that it was aware of her. That she'd annoyed it, and had its attention. She used the suit's thruster and the thin microgravity drift to pull herself back down to the surface, half expecting it to grab her and haul her inside to be punished, but it didn't.

Her radio was hardened enough to work. "This is Sergeant Draper," she said. "Is the rail gun still firing?"

"THE FUCK DID YOU DO?" a man's voice screamed, high and frightened. She cut off all their mics.

"That's what I'm asking, soldier," she said, then switched over to private. "Amos?"

"Don't know what you did, Babs, but it fucked things up in all the best ways. Rail gun looks powered down, the few remaining assholes are pulling back toward assholeville, and I think these metal bands that everything's stuck to are moving a little."

"Yeah, I may have popped those loose."

"Impressive," Amos said. "Hey, look, I got to go shoot somebody."

"No problem," she said, and opened the channel to the *Rocinante*. "Okay. You guys still out there?"

"Bad guys are getting really, really close," Holden said. "Tell me you have good news."

“I have good news,” Bobbie said. “You can come through the ring. In fact, if you could get over here and get us some air support, it would be much appreciated.”

There was a general whooping, made strange and uneasy by the interference of the ring. Was it her imagination that it was louder now?

“You got them?” Holden said, and she could hear the grin on his face. “You took the rail guns? We control them?”

Her suit sensors showed the wall of steel nearest her was starting to shift. Just a few centimeters, but there was definitely movement. It was broken. It was all broken. The rail guns weren’t going to defend anyone anytime soon.

“We don’t,” she said. “But at least no one does.”

Chapter Forty-Six: Holden

You know what I'd like?" Alex yelled down from the cockpit.

"If we could get out of here?" Holden yelled back.

"If we could get out of here. At this rate we're going to be sitting here with our jumpsuits around our ankles when the bad guys get back," Alex said. "There's a reason they don't call those things *slow-attack ships*."

Even though Naomi was strapped into the couch beside Holden's, she answered over the headsets so she at least wasn't shouting about it. "The *Giambattista*'s a big ship, Alex. You're just spoiled because you haven't had to drive a cow like that in years."

"Shit," Alex said. "I could have spun the *Canterbury* around in half the time this is taking."

Naomi's sigh was as close as she was going to get to agreeing with them. "Well, you were good at your job."

On the screen, the *Giambattista* slid slowly sideways toward the ring gate. The damage from the attack ships' first run had done something to unbalance the maneuvering thrusters, so a lot of the piloting involved rotating the ship and then waiting until the working thrusters spun into the right position to fire. The plumes of the returning attack ships were already visible. It wouldn't be long before the torpedo barrage would kick in again, unless the Free Navy was going for a wait-till-you-see-the-whites-of-their-eyes approach. The enemy had split, curving back toward them in an almost hundred-degree spread. It wasn't quite as bad as it could have been. If they'd taken the time to bring their attacks from opposite directions, defending the *Giambattista* with the *Roci* would have been almost impossible. But it would also have taken enough time to play the vectors and get in position that the *Giambattista* would have cleared the ring gate before they arrived. It was like they were all being forced to find a min/max point in a complex curve of inertia, acceleration, and a lot of dead people.

The *Giambattista*'s main drive fired, the plume dwarfing the ship, and Alex crowed in celebration.

"About time," Naomi said. "I'm matching course. We'll be through in twenty minutes."

Holden opened a connection to Bobbie. The seconds stretched out long enough that he started to feel his gut tighten. The connection came through, dropped, then reestablished just as Naomi said, "One of them's burning to pass through the gate with us." He'd get right back to that.

"We're looking at twenty minutes to get through the gate. Where do you stand?"

The weird interference of the gates made her reply thick and creepy. She was breathing hard, and until there were words with it, he was picturing her gut-shot and on the float. Or drifting down onto the surface of the alien station. He was reaching to switch over to Amos when she spoke.

"Amos's holding position against the enemy," she said. "I'm almost back to them. Suit ran out of propellant mass, so I'm hoofing it with the mag boots."

"You're running back to the fight?"

"Well, call it a fast shuffle," Bobbie said between breaths, "but it's fine. They put in. A big metal road. Goes right to 'em."

"Okay. We'll get some backup to you as soon as we can. Just don't get killed before we get there."

"No promises, sir," Bobbie said, and he would have sworn from her voice she was smiling when she said it. A blast of static, and the connection dropped.

"Okay," Holden said. "What have we got?"

"They're both shooting at us," Naomi said.

"You sound calm about that."

She looked over at him. Her smile was sudden and bright and made his heart ache a little bit. "It's all Hail Mary bullshit. It's not even an attack so much as an opportunity to let us screw up."

"Okay. So, not worried about that. What are we worried about?"

Naomi flipped the drive analysis of their pursuers over to his monitor. The nearer of the ships had altered its path, and the projected curve put them through the ring and into the slow zone five minutes after the *Roci* and *Giambattista* made the transit. They weren't breaking off. That was too bad.

“Do we have a plan for dealing with that?”

Alex answered over the ship comm. “I’d vote for shooting them.” And a moment later, Clarissa, “Seconded.”

Holden nodded to himself. It still felt weird hearing her. Maybe it always would.

“Okay, let’s lay in a targeting solution.”

“Did it while you were talking to Bobbie,” Naomi said.

The PDCs chattered for a moment, then went silent. Cleaning up the Hail Mary attacks. Holden rubbed his hands on his thighs. Tapped his fingers together. Pulled up the tactical to see the ring and the alien station, Medina and the fast-attack ships.

“We’ll have enough to defend everything even if both ships follow us in, right?”

“Hush,” Naomi said.

Looking through the exterior cameras, the ring seemed to wipe away the stars as they passed through it. Alex did a short, hard braking burn, turning their nose toward the gate and the narrowing circle of stars beyond it. The *Giambattista* twisted and burned and twisted again, its remaining hatches opening. Pinpoint drive plumes streaked out from it, less than fireflies compared with the wide, glowing burst of the hauler’s Epstein drive. Holden watched as a handful, and then a dozen, and then a hundred poured down toward Medina. The OPA coming to finish the job. The remaining landing boats spread out, a wide, diffuse target. At this distance, Medina’s PDCs were useless, and the *Roci* could probably take out any torpedoes. But even if they did fire, they’d only take out a handful of soldiers and leave an army still behind.

He tried opening a tightbeam to the incoming attack ship, but the interference from the ring was too thick, so he switched to broadcast. “Attention incoming attack ship,” he said. Naomi looked over at him, a question in her eyes. Not concern or worry, though. She trusted him. “This is James Holden of the *Rocinante*. Please break off your approach. We don’t have to do it this way.”

He waited. The tactical display was thinner than it had been. All they knew of what was happening in the solar system was what leaked through the gate. The Free Navy’s attack ship didn’t answer, but dove toward them.

“He ain’t thinking this through, Hoss,” Alex shouted down. “What do

you want me to do?”

“Give them a chance,” Holden said.

“And if they don’t take it?”

“Then they don’t,” Holden said.

The ring grew smaller as they fell away from it, like looking up at the circle of a well from down in the water. The attack ship was braking hard toward the ring. Just as the first of the *Giambattista*’s second-wave ships were about to reach Medina and the alien station, the attack ship passed through the ring, launched a half dozen torpedoes, and exploded in a star-bright failure of their drive’s magnetic bottle when Alex fired the *Roci*’s rail gun through it. Holden watched in silence as the expanding cloud of gas that had been a ship full of men and women spread out and began to fade.

He tried to feel some sense of victory in it, but mostly it just seemed absurd. The slow zone, the gates, even the merely human ships that had carried them out so far. They were miracles. The universe was filled with mysteries and beauty and awe, and all that they could manage to do with it was this. Chase each other down and see who was the faster draw.

Everything in the slow zone—the *Giambattista*, its cloud of attack boats, Medina Station, the *Rocinante*—seemed to pause for a moment. A connection request from Bobbie interrupted him, and he accepted it.

“We’re secure down here,” Bobbie said. She was still breathing hard. “Enemy has surrendered.”

“We took them alive?”

“Some of them,” Amos said.

“They put up a hell of a fight, even after it was hopeless,” Bobbie said. “We lost some too.”

“I’m sorry,” Holden said, and was a little surprised to notice how much that was true. Not just something you said at times like this. “I wish there’d been another way.”

“Yes, sir,” Bobbie said. “I’m going to oversee putting the prisoners in a transport. But there’s something you should know.”

“Yes?”

“These aren’t Free Navy down here. The people defending the rail gun network were Martian.”

Holden let that sink in. “The ones from the coup? Duarte’s people?”

“They’re not saying anything, but that’s my assumption. This could be

important.”

“See they’re kept safe and treated well,” Holden said.

“Already on it,” Bobbie said and dropped the connection.

Holden shifted his monitor to the exterior cameras and shifted the view until he could see the *Giambattista*, the alien station, and—far enough away that it hardly seemed like more than a shaving of metal, invisible without the *Roci* enhancing it—Medina Station. He folded a hand over his mouth, turned on identification markers for all the landing skiffs and jerry-rigged boats, watched the display vanish under the cloud of pale green text, turned them off again and stared into the blackness. His eyes felt gritty. It was like all the anxiety and tension that he’d built up during the burn out to the ring had collapsed. Turned into something else.

“You all right?” Naomi asked.

“I was thinking about Fred,” he said. “This? It’s what he did. Lead armies. Take stations. This is what his life was like.”

“This is what he retired from,” Naomi said. “When he decided to start trying to get people to talk things out instead of shooting people, this is what he left behind.”

“Well, let’s see how that works,” he said. He set up the camera, considered himself on his screen, and ran his fingers through his hair until he looked a little better. Still worn-out. Still tired. But better. He set the system to broadcast.

“Medina Station. This is James Holden of the *Rocinante*. We’re here to take administration of the station and the slow zone and the gates back from the Free Navy. If you really want, we can spend a while shooting your PDCs and torpedo arrays until they don’t work and then land all these boats. We’ve got a lot of people with guns. I figure you do too. We could all kill a bunch more of each other, but I’d really prefer that we do this without losing anyone else. Surrender, lay down arms, and I promise humane treatment for the Free Navy’s command structure and any other prisoners.”

He tried to think of something else. Something more. A sweeping speech about how they were all one species after all, and that they could shrug off the weight of history if they chose to. They could all come together and make something new, and all it would really take was doing it. But all the words he could think of sounded false and unconvincing in his mind, so he cut the feed instead and waited to see what happened.

Naomi slipped out of her crash couch, floated to the lift and down. She came back a few minutes later with a bulb of tea. Slipped back into her couch. Waited. If it went on much longer, Holden knew he'd have to launch the attack. The boats weren't built for much more than scooting from one ship to another. They'd start running out of air and fuel before long. But maybe a few minutes more ...

The response came. Clear, unencrypted radio signal, as open as his demand for surrender had been. The woman in the Free Navy uniform was on the float in a very familiar room. The religious images on the wall behind her were like symbols from a recurring dream about violence and blood and loss.

Only maybe this time would be different.

"Captain Holden. I am Captain Christina Huang Samuels of the Free Navy. I will accept the terms of your surrender on the condition that you guarantee the safety and humane treatment of my people. We reserve the right to record and broadcast your boarding action to assure that all of humanity will bear witness to your behavior. I do this out of necessity and loyalty to my people. The Free Navy is the military arm of the people of the Belt, and I will not sacrifice the lives of my people or the unaffiliated civilians of Medina Station when there is no profit to be had from it. But I myself will stand now and forever against the tyranny of the inner planets and their exploitation and slow genocide of my people."

She saluted the camera and the message ended. Holden sighed, started up his broadcast again.

"Sounds good," he said. "We'll be right over." He killed the broadcast.

"Seriously?" Alex called from above. "'Sounds good, we'll be right over'?"

"I may kind of suck at this job," Holden called back.

The voice over the ship's comm was Clarissa's: "I thought it was sweet."

The fall of Medina Station took twenty hours from the first OPA ships docking to the last Free Navy operative being locked in a cell. Medina's brig wasn't anywhere near big enough, so it was reserved for the higher

officials—the command staff, the department heads, the security officers and agents. The others—mostly technicians and maintenance—were confined to their quarters with the doors locked by the station system. Which meant, in the end, by Holden. He couldn't help feeling like he'd just sent a thousand people to their rooms to really *think* about what they'd done.

He set up his command post in the central security office in the drum. The spin gravity wasn't so high it would bother Naomi, and there was something restful about being able to collapse into his chair while they watched the newsfeeds from Earth. Bobbie Draper, now the acting head of security for Medina, sprawled at her desk, legs up, hands behind her head, looking as relaxed as he'd seen her since she and Amos had come on board the *Roci* again. One sleeve was rolled up, and a bright, blistered burn ringed her elbow in the shape of a vac suit's seal. She rubbed it gently. Caressed it. There was something unnervingly postcoital about her response to violence. Alex and Amos were in the next room where Naomi was combing through the station logs with an OPA engineer named Costas, arguing about something that involved yogurt and black beans. Only Clarissa hadn't come on the station, and Holden hadn't asked why. His memories of the *Behemoth* were bad enough. He couldn't imagine hers.

On the newsfeed, The Hague looked like a battered, sepia-soaked version of itself. The sky above the UN building was white with haze, but it wasn't dark. And Avasarala stood without a podium. Her bright-orange sari looked like a victory banner.

"The liberation of Medina means more than freeing one station from violent tyranny," she said, reaching the crescendo of the half-hour-long speech. "It means the reopening of the path to all the colonies and all the worlds that the Free Navy tried to lock away. It means the reconnection to the motive force of history, and *proof* that the spirit of humanity will never bow to fear and cruelty. And yes, since you've all behaved so nicely, I'll take some questions. Takeshi?"

A thin reporter in a gray suit stood up, a reed among the ranks of his professional fraternity.

"Shit," Alex said from the doorway. "Are there reporters anywhere else, or does she have all of them?"

"Shh," Bobbie said.

“Madam Secretary-General, you said that the attack on Earth was not an act of war but the lashing out of a criminal conspiracy. Now that you have captured prisoners, how will they be handled?”

“The conspirators will be brought to Luna and introduced to their lawyers,” Avasarala said. “Next quest—”

“Just the ones from Medina? Or Pallas and Europa too? Won’t that create a burden on the court system?” the gray man pressed.

Avasarala’s smile was sweet. “Oh, that guy’s fucked,” Bobbie said.

“Oh yeah,” Holden agreed.

“It will take some time to process everyone,” Avasarala said. “But I have to put some blame for the delay on the Free Navy itself. If they wanted a faster trial, they shouldn’t have leveled so many courthouses. Next question. Lindsey?”

“She shouldn’t be milking this so much,” Bobbie said while a blond woman stood in the gray man’s place and asked something about reconstruction and the role of the OPA. “It’s going to bite her.”

“It’s the biggest unambiguous victory we’ve had against Inaros,” Holden said. “Everything else, he stripped to the studs and walked away from. Or left for us to crawl over, disarming his booby traps. Even the thing at Titan looks like it cost us as much as it got back. Earth needs a win. Hell, Mars needs a win. I’m just glad it’s one that had Belters fighting on our side too.”

“But if she builds it up too much, it’s just going to be worse when we lose Medina again.”

Holden looked over. “Why do you think we’re going to lose it?”

“Because I had to kill the rail guns,” Bobbie said. “Holding on to this place assumed we could *take over* the defenses. We didn’t. We broke them. If we can get a dozen ships in here with guns like the *Roci* or maybe a pair of *Donnager*-class battleships, we can hold it. But that means getting them here, and we have to assume Inaros is throwing every spare grenade and bullet into whatever ships he has to burn here and kick our asses. And that’s if his patron out past the Laconia gate isn’t already sending the MCRN ships *he* stole to clear us out.”

The knot in Holden’s gut that had loosened a couple notches since he’d stepped onto Medina tightened back up. “Oh,” he said. “So. Do we have a plan to address that?”

“Fight like hell and hope the bad guys spend so much time killing us

they can't finish rebuilding before whoever Avasarala and Richards send next gets here."

"Ah."

"We've been screwed since the minute I blew up that reactor. Doesn't take away from the essential dignity of the situation. And this is a fine hill."

"A what?"

Bobbie looked over, surprised he hadn't followed the idiom. "Fine hill to die on."

Chapter Forty-Seven: Filip

What was it like?” Filip asked, trying to sound casual.

Her name was Marta. She had a wide face with a scattering of moles along her jawline like she’d been splatted by something. Her hair was lighter than her skin. Of all the people in the club, she was the one who seemed to have the most patience with the new guy. When the karaoke was going, she’d offered him the mic, even though he hadn’t taken it. When the club had gotten crowded, she’d let him sit at the end of her table. Not with her, but not *not* with her either. She’d grown up in Callisto, born here. Worked for one of the warehouses doing compliance checks. She was about a year older than him. She’d been sixteen when it happened.

She narrowed her eyes and tilted her head. “What was the attack like? For for?”

“Wondered,” he said with a shrug. The club was dark enough she probably wouldn’t see him blushing. “Heard about it since I came.”

Marta shook her head, looked away. Someone jostled against Filip’s back on their way toward the bar. He was about to apologize—was finding the words for it—when she spoke.

“Was eine day, yeah? Woke up in the morning, same same. Got ready for school. Mom made hash and coffee for breakfast. Just eine day, same like otra. Was talking with some friends in the common room and everything shakes, yeah? Just once. Just a little bit, but everyone feels it. We all ask each other, and everyone feels it. Then the teacher come in all rapiutamine and says we have to get to the hard shelters. Something going on over à los Martian yards. Figured a reactor blew. Knew it was bad though. We’re hardly in when the next one comes, and it’s worse. Lot worse.”

“All the hits were on the Martian yard, though,” Filip said.

“Same rock,” Marta said with a shrug and a laugh. “Not like you can

kick half a ball. Anyway, alarms are going off y everyone's crying. And then when they let us back out, it's just gone. Martian yard's delenda, and half of ours too. It was just ... no sé. It was just everything before and then everything after."

"But you were okay," Filip said.

Marta shook her head, just a little. "My mom died," she said with a fake lightness. "Shelter she was in cracked."

Filip felt the words in his sternum. "Sorry."

"They said it was fast. She wouldn't have known even."

"Yeah," Filip said. His hand terminal chimed for the fourth time in the hour.

"You sure you don't want to answer those?" Marta said. "Your girlfriend's wanting you pretty solid."

"No. It's all right," he said. And then, "I don't have a mother either."

"What happened to yours?"

"Broke up with my dad when I was a baby. Dad always said he hid me away because she was crazy. But I don't know. I met her first time a few months ago, but she's gone again."

"Did she seem crazy to you?"

"Yeah," Filip said. Then, "No. Seemed like she didn't want to be there."

"Harsh."

"She told me that the only right you have with anyone in life is the right to walk away."

Marta coughed out a disbelieving laugh. "Kind of bitch says that to her kid?"

The doors to the club were built like an airlock with inner and outer doors either side of a short hall, but to keep the brightness of the common corridor out. A bright streak and a few silhouetted bodies showed both sets of doors opened at once. Filip wondered whether he should tell the girl more. *I thought I watched her kill herself, only it turns out she didn't die. She was only leaving again.* It was true, but it wouldn't seem like it. Some things you couldn't talk about except with people who'd been there. His hand terminal chimed again.

Someone shoved him, hard. Filip's stool tilted, and he grabbed the table to stop his fall. Marta yelped and stood up, shouting as she did. "Berman! Que sa?"

Filip turned slowly. The man who'd shoved him was his own age plus maybe a year or two. Deep-green jumpsuit with the logo of a shipping company on the sleeve. His chin jutted. His chest was pushed forward, his arms pulled back. Everything about him said he was looking for violence except that he wasn't hitting Filip.

"Que nammen?" the new man demanded.

"Filip," he answered. He was aware of the mass of the gun in his pocket like it was calling to him. Calmly, slowly, he put a hand against the grip of the pistol. Marta shoved her way between them, her arms wide. She was yelling about how Berman—who had to be the guy with the chin—was out of his mind. How he was stupid. How she was just talking with coyo and Berman was out-of-his-head jealous and fucked up too. Berman kept shifting his head to stare at Filip around her. Filip felt his own rage boiling up, like fumes off a fire. Draw the gun, level it just long enough for the coyo to know what was coming, then bang and the kick in his wrist. He was Filip Inaros, and he'd killed billions. He'd killed Marta's mother.

"It's okay," Filip said as he stood. "Misunderstanding. No harm, sa sa?"

"Pinché asshole *better* run," Berman shouted at Filip's back, and then Marta shouting some more and Berman shouting at her, and Filip was in the fake airlock and pushing through to the common corridor beyond. It was bright there. The smell of liquor and old smoke stayed around him for a few seconds before the gentle breeze from the recyclers pulled it away. He was shaking. Trembling. His hands ached with the need to hit something or someone. He started walking without any idea where he was walking to, just needing something to let him move. Let whatever beast was running through his bloodstream work itself out a little.

Callisto passed him as he went. Pale corridors wider than most of the stations and ships he'd been on, with a honeycomb pattern on the curved walls that made him think of a football. Banks of heaters made irregular tapping sounds as they glowed down from the ceilings, radiating at the top of his head the way that the cold of the moon's body crept up from the floors. People walked or rode bicycles or carts. He wondered how many of them had lost family in the attack on Callisto. In the story he'd told himself about the attack, it had all been Dusters that died. Soldiers whose work was to keep the Belt's head underwater until it drowned. And in his story, his father was the leader to unite the Belt, to lead it against everything that was

bent on destroying their futures and erasing their pasts.

And he still thought that. Even while he doubted, he believed. It was like everything in his private world had doubled. One Callisto that had been the target of his raid. His critical victory that led to the bombardment of Earth and the freedom of the Belt. Another Callisto that he walked through now, where normal people had lost their mothers and children, husbands and friends in a disaster. The two places were so different, they didn't relate. Like two ships with the same name but different layouts and jobs.

And he had two fathers now. The one who led the fight against the inners and who Filip loved like plants love light, and the one who twisted out of everything that went wrong and blamed anyone but himself. The Free Navy that was the first real hope the Belt had ever had, and the Free Navy that was falling apart. Swapping out generals and leaders faster than air filters. They couldn't both exist, and he couldn't let either version go.

His hand terminal chimed again. He plucked it out of his pocket. The connection request came from Karal and the *Pella*. It was the twelfth he'd made. Filip accepted.

"Filipito!" Karal said. "Hell have you been, coyo?" He was on the command deck and wearing his uniform. Even had the collar done, which he usually didn't. It didn't make him look like he was military, though. He looked like himself, but in costume.

"Around."

"Around," Karal said, shaking his head. "You got to get back to the ship. You got to come *now*."

"For for?"

Karal leaned in close to the screen like he was going to whisper a secret. "Battle analysis leaked out à Medina, yeah? The rail guns are down. Medina has one ship guarding it. *One*, and it's—"

"*Rocinante*," Filip said.

"Sí no? Every ship with more than half a hull, Marco's putting them together. Retaking Medina like we're putting out a fire, us."

"Yeah," Filip said.

"Getting fresh juice. Topping up the reaction mass. And then we're gone. Meeting up with the rest of the navy on the way, but your father? I've never seen him like—"

A voice came from the hand terminal, snapping Karal's attention away

from him. “*You found him?*”

“Que no?” Karal said, but not to him.

The image jumped, cutting from one camera to another. An empty crash couch with a vague shadow along one edge. The shadow fell back, gained resolution, became his father. Filip braced for abuse, for contempt. For all the condescension he’d been suffering. *Say it like a man. Say I fucked up.* His stomach was tight.

Marco beamed at him, eyes bright.

“Did you hear? Did Karal tell you?”

“About Medina, and the ship there.” For some reason he couldn’t explain he didn’t want to say the name *Rocinante* out loud. He felt it would be like bad luck.

“This is our moment, Filipito. It has all come together perfectly. We bit them and bit them and bit them and faded into the dark until they went mad with it. They’ve pushed out past their defenses, and now we can come down on them like a *hammer*.”

Them. He didn’t mean Earth and Mars. He didn’t mean the governments of the inner planets. Whether he knew it or not, Filip was certain—as certain as he’d been of anything—that James Holden and Naomi Nagata were *them*.

“That’s good, then,” he said.

“Good?” his father hooted. “This is it. This is the opportunity we’ve been waiting for. This is how we break them. All the half-loyal cunts in the OPA who trotted wherever Fred Johnson led them? Pa and Ostman and Walker—all of them. They all fell in with Holden, and we will take him away from them just the way we killed Johnson. We will punish them for their disloyalty.”

Filip felt a little thrill of excitement. The idea of victory—resounding, triumphant, and final—was intoxicating. His father’s joy bore him up, promised to wash away all his anger and his doubts. But there was another Filip, a smaller and less emotional one, who watched the swelling enthusiasm with disgust.

Luring Naomi and her lover out to Medina to be killed was the plan now. But more than that, it had always been the plan. They’d killed Fred Johnson as part of it. They’d abandoned Ceres too. The consolidated fleet’s massive and coordinated attacks had been them falling for his father’s

brilliant strategy to lure them out.

And if it failed, if something went wrong, that would always have been the plan too. His father's new generals would change, getting better with every purge. And when it got so foul there was no way to pretend it into victory, it would be someone else who had failed. Maybe Filip.

"Highest burn we've ever done, but it will be worth it," Marco was saying. "It will carry rewards greater than anything before it. Only there isn't time to waste. We're launching inside the hour. All hands. All ships, *everyone*. We'll melt the fucking ring with our braking burn and char Holden to ash."

Marco clapped his hands, delighting in the prospect. Filip smiled and nodded.

"As soon as we're supplied," Marco said, growing a degree more sober, "we're gone. Be back to the ship in half an hour, yeah?"

"All right," Filip said.

Marco looked out of the screen and into his eyes. There was a softness in his expression. A kind of sensual pleasure almost indistinguishable from love. "This will be glorious," his father said. "They will remember this forever."

And then, like an actor having delivered his final line, Marco dropped the connection.

Looking up from his hand terminal felt like coming out of a dream. He'd just been someplace else, with someone. And now he was here again, in this corridor. If he turned around, he could go back to the club he'd been in. It seemed strange in a way he couldn't quite explain that his father's glorious battle plan and a common corridor of Callisto yards should exist in the same universe. Maybe because, in a way, they didn't.

The docks weren't far. There was a tube station that could have gotten him there in five minutes, but half an hour was more than he'd need to walk the distance. He put his hand terminal back in his pocket where it clicked against his pistol, a nearly inaudible tick with every step.

Moving from the residential corridors to the docks had a thousand little signals. There were none of the teenage girls here, and more of the people drifting through the intersections were wearing jumpsuits and tool belts. The air smelled different. Even if they used the same filters, the docks would always smell of welding and synthetic oil and cold. He still had

twenty minutes.

The concourse between the military and civilian yards was shaped like a massive Y. Where the paths met, someone in the station had decided it would be a good idea to put a statue of something that looked like a wide, abstract Minotaur fashioned out of brushed steel. Directly above the weird art, a screen listed the berths and the ships in each of them. On the military side, there were seven Free Navy ships, an Earth transport they'd captured when they took the station, and three empty berths. He looked at the word PELLA for a couple breaths as if it were as much a piece of art as the uncomfortable man-bull beneath it. On the civilian side, almost a dozen ships. Prospectors, miners, transport. An emergency medical relief ship. He imagined there would have been more if there wasn't a war on.

Against the wall, another screen showed the exchange rates for fifty or sixty kinds of scrip—corporate, governmental, cooperative, commodity-based. A small gray rat scampered along the floor underneath the screen and squeezed itself into a hole Filip hadn't even noticed was there like it was falling into shadow. His hand terminal chimed, but he ignored it. The docks were right there.

Just down the corridor to the civilian docks, there was a waiting area with six rows of uncomfortable ceramic chairs facing each other and a bright orange recycler at the end of every other row. An old man in a fake leather coat and grimy pants stared blankly in Filip's direction, seeing him but not seeing him. A row of grimy kiosks dug into one wall. A noodle stall. A public terminal. Two union offices. Employment and housing brokers. Filip looked at them all with the same detachment he'd felt looking at the berth displays.

His hand terminal chimed again. He took it out without looking at it, switched it to his off-hand, and drew out the gun. The old man's stare was less blank now. He watched as Filip walked toward the chairs and fed first the gun and then the hand terminal into the recycler. Filip nodded to the old man, and after a long moment, the old man nodded back.

The employment broker's kiosk had bright marks of wear at the edge of the counter, worn into the metal by millions of tired elbows. The bulletproof glass had pits in it, tiny as stars. The woman behind the glass wore her gray hair in a buzz cut. The place smelled vaguely of piss. Filip walked to the

counter and rested his elbows on the edge.

“I need work,” he said like someone else was saying it.

The gray woman flicked her eyes up at him, then back down. “What can you do?”

“Environmental maintenance. Machining.”

“Both or either?”

“Anything. I just need work.”

The counter lit up. A virtual keyboard and a form. He looked at it, his heart sinking.

“Put in your employment ID,” the gray woman said.

“I don’t have an employment ID.”

The flicker of her eyes was longer this time. “Union waiver?”

“I’m not in a union.”

“No ID, no waiver. You’re fucked, kid.”

There was still time. He could run. He could catch the *Pella* before she left. His father would wait for him. They would burn out to Medina. They would take back the Belt for Belters, and it would be glorious. His heart started racing, but he put his hands on the edge of the counter. Squeezed like he was holding himself in place.

“Please. I just need work.”

“I run a clean shop, kid.”

“Please.”

She didn’t look up. He didn’t move. The right corner of her mouth quirked up like it was somehow independent of the rest of her face. The counter blinked, and a shorter form appeared. PRÉNOM. NOM DE FAMILIE. RÉSIDENCE. ÂGE. COORDONNÉES.

“I’ll see what I can do,” she said, not looking up.

He put his finger on COORDONNÉES. “I don’t have a hand terminal.”

“You can come back tomorrow,” she said like it was a common enough problem.

PRÉNOM: FILIP

NOM DE FAMILIE:

“You okay, kid?” The hard eyes on him. He nodded.

NOM DE FAMILIE: NAGATA

Chapter Forty-Eight: Pa

The light of the sun was strong enough to turn the tangerine-colored haze to its midday twilight. A bright patch showed its place. Saturn hung on the far side of Titan's atmosphere somewhere, along with the debris that had been a hundred or more ships. Michio remembered a moment in the chaos of the battle seeing Saturn on her screen. It had seemed so close, she could make out the complexity of the rings. She remembered it, but it might not have happened. Her memory of the violence was spotty.

The resort was astounding. The dome rose up fifty meters above the ground, a swirl of titanium and reinforced glass with ivy dripping down like hanging gardens. Terraces rose in curves, designed to create breathtaking views out of a featureless, hazy sky. Finches darted here and there, flickers of color, as artificial and foreign to the moon's environment as she was. As any of them were. From where she sat, Michio could look down on swimming pools and courtyards of fake brick and ferns. Bright foil emergency shelters were propped up next to luxurious wet bars. The wounded slept on chaise longues and deck chairs because the hospital beds were full.

The dome resorts had been built decades ago for the wealthy of Earth and Mars. A place for the captains of finance and industry to rest while they worked on building up the settlements on Saturn's moons and hauling ice from its rings. An exotic site for tourists to come and pretend they'd experienced life in the outer planets without ever having to experience it.

They had done a good trade ever since, and not only among the inners. For Belters, the resorts were as close to experiencing life on Earth as they would ever reach. Open air. A real, free-flowing atmosphere to look at if not to breathe. Food and liquor imported from Earth and Mars. And so it had become a kind of halfway point—a haven for Earthers in the outer planets and a version of Earth that Belters could enjoy. She wondered

whether an Earther would find it as unlike Earth as she found it unlike the Belt. Maybe what they really had to share was its lack of authenticity.

She had never been here before, and if she had her way, she would never come back.

Footsteps sounded on the terrace behind her. She turned, winced, and then kept turning despite the pain. The burns on her back only itched now if she kept still. She was afraid, despite all the doctors had said, that she'd scar up and lose her ability to move if she didn't keep stretching the wounds.

Nadia's smile was weary, but real. She carried fresh bandages and a white tube of cream in one hand and a hand terminal in the other. Michio grimaced, then laughed ruefully.

"Is it that time again?" she asked.

"Such," Nadia said, "such are the joys. I brought you something to take your mind off it, though."

"Something good?"

"No," Nadia said, taking a seat behind her. "The Earther woman wants to talk to you again."

Michio shrugged off the paper robe from the hospital and leaned forward. Nadia passed the hand terminal to her and began examining the edges of the false skin that covered her wounds. The nerves that let her experience light touch were smothered by living bandage. The ones that reported pain were terribly sensitive. It was like being numb and skinned alive at the same time. Michio gritted her teeth. Waited. When she had made the full circuit—across Michio's back and down her left side and arm—Nadia sighed.

"It looks good?" Michio said.

"It looks terrible, but it's healing well. Basal growth all the way around."

"Well," Michio said. "Thank God for small favors."

Nadia made a small sound in the back of her throat, neither agreement nor dissent. Michio heard the soft crack as Nadia opened the tube of medicated lotion. Michio scooped up the hand terminal, opened her message queue. The new message from Earth was waiting for her, flagged as critical. Chrisjen Avasarala. The leader of Earth, and the greatest enemy Michio Pa had ever had. And yet here they were.

"We did this wrong," she said.

"What?" Nadia asked.

Michio lifted the hand terminal for Nadia to see. “We’re working with the people we used to be fighting against.”

“We’ll fight them again later,” Nadia said, like she was promising a sweet to a child, but only after she ate her real food. “Are you ready?”

Michio nodded, and Nadia smeared on the first finger-load of ointment. The pain was bright, like she was burning again. She started the message, tried to focus on it.

The old woman appeared, sitting at a desk. It wasn’t the first time Michio had gotten a message directly from her or from the new prime minister of Mars, but more often she’d heard from generals or functionaries. They only seemed to include Michio when they were asking for something big. It very much gave her the sense of being the least important person at their table.

“Captain Pa,” Avasarala said, and if there was an undertone of contempt in the words, it was only to be expected. Nadia moved lower on her back, new pain blooming just as the first swath began to fade. “The situation on Medina has gone pear-shaped. Holden and the OPA forces have succeeded in taking the station, but saw fit to annihilate the rail gun defenses. Which leaves them undefended. The Free Navy has deployed what appears to be every functioning ship they have left—fifteen in all—burning hard for the gate. The good news is that Inaros has essentially retreated from every other port and base in the system. The bad news, of course, is that he’ll get Medina back, his supply lines to Laconia reestablished, and in a defensible position. Unless, of course, we find a way to stop him.”

Avasarala took a deep breath, looked down, and when she looked up again, something had changed in her face. She looked wearier? Older? More determined?

“I am very, very sorry for the loss you suffered. It strikes close to home. I lost a spouse to this war as well. I can’t imagine how devastating it must be to lose two. I would not ask this if it were not critical, but if you have any ships or influence with any factions that can help us to stop or slow Inaros before he reaches the gate, we need your help now.

“Nothing I can offer you will address the sacrifice you have already made, but I hope you will walk this last kilometer with me. And that we can end this together. Please let me know as soon as you can. The Free Navy is already burning.”

The message ended, and the terminal dropped back to her queue. Nadia moved on to her side, and Michio flinched.

“Almost done,” Nadia said.

“This is the second time one of our enemies has called me to pull them out of a fire.”

“*Can* we do it again?”

“All we did last time was burn ourselves trying.”

She'd known going in that there might be a price for leaving the *Panshin* behind. Titan was the largest of Saturn's moons. The Free Navy had its strongest presence outside the Jovian system there, projecting threat toward Enceladus, Rhea, Iapetus, Tethys. The ice buckers in the rings. Controlling the space without occupying it.

The *Connaught* and the *Serrio Mal* burned in spinward, looping up out of the ecliptic to come down on the Free Navy's ships from an unexpected angle. The burn hadn't been as hard as Michio had hoped. There hadn't been a chance to add reaction mass, and she'd had the sick fear that they'd end up losing the fight at Titan and not be able to retreat. Fifteen Free Navy ships had been stationed there. For most of her life, that wouldn't have been a very large number, but after so much war and so many people taking their ships out through the rings to new systems, it was respectable. It was more than the nine that the consolidated fleet threw at it. But then the point of all the attacks wasn't to win. It was to keep Marco's eye off the two ships skinning off toward Medina.

The Martian Congressional Republic Navy had taken point in the battle, engaging early and trying to pull the Free Navy's ships out of position in hopes that her own attack from the side would come unexpectedly. She remembered Oksana getting the tactical display. Fifteen of the enemy, nine friendlies. Oksana made a joke about how every ship in the battle had probably been built in the same shipyard. Evans had laughed, then sobered and said they were getting painted.

After that, Michio's memory became less reliable. She'd gone over the logs. Things hadn't turned on her that early, but the strike, when it came,

was like a shotgun blast in her life. It took out a massive hole, but stray pellets had traveled forward and back in time, made smaller holes in her experience. She remembered giving the order to retreat, and Josep saying they'd lost core, but she didn't remember the hit that had made her decide to run. She remembered the smell of her clothing and hair burning. But the long, terrible moments between identifying the torpedo that cracked the *Connaught's* back and the actual impact were gone.

What she knew from the logs was that the *Serrio Mal* and the *Connaught* had fired down into the heart of the Free Navy formation, drawing the enemy fire and scattering their position to open up corridors and blinds where the enemy PDCs weren't reinforcing each other. The Martian ships, being closer, had fired a massive barrage of torpedoes that managed to disable two Free Navy ships. She didn't know if the round that took out her drive was from the Free Navy or from a stray from the MCRN, but an enemy torpedo had managed to thread its way through their defenses and blow hours out of Michio's consciousness.

She had the strong impression of a broad-shouldered man with a shaved head and dark skin telling her he was going to make the pain stop but she had to put down the knife. She couldn't place when that had happened. She vividly recalled waking in a hospital room, and then waking there again without any sense of having fallen asleep in between the two.

The beginning of what she thought of as "after" was when she came to and found Bertold sitting at the edge of her bed, massaging her feet and singing a low dirge under his breath. She'd asked about Laura first, which in retrospect made her think she'd known something was wrong with her.

Bertold said Laura had been hurt. Was in a medical coma. They'd need to regrow part of her liver and one of her kidneys, but Laura was the wife of the pirate queen, and the doctors promised she'd be fine, given time.

Then he'd told her about Evans and Oksana, and they'd cried together until she slept.

The quarters they'd assigned this new, smaller version of her family were beautiful. Three bedrooms with wide, soft beds enough like crash couches that they were comfortable and different enough to seem like luxury. A food station with a narrower range of options than they'd had on the *Connaught* and brighter chrome. What the resort called a "conversation pit" that looked like a long, curved couch that had burrowed into the floor.

Skylights opened to the dome, boasting natural light. A soaking bath big enough for two. Bertold, Nadia, and Josep the only ones to share it with her. Everything about it seemed too large and too small at the same time.

She waited until the ointment had soaked deep into her new, artificial skin, then put on what she called her “captain’s uniform.” Nothing really more than a formal shirt and a jacket with a vaguely military cut. She pulled on pants and boots, even though they wouldn’t show in the message she sent back. Her mind was still fuzzy from the pain medications, and she didn’t understand quite why being formal about the message felt so important to her until she sat down, framed herself, and began her recording.

It felt important because it was a surrender.

“Madam Secretary-General, I am very sorry to say that I don’t have any aid to give. The ships I had to command are either dead or broken or scattered so far from the ring gate that they couldn’t catch up to the *Pella* without killing everyone on board before they got to it.”

The version of her on the screen looked tired. Bertold had cut her hair short so that the places where it had burned didn’t stand out. She didn’t like how it looked. A wave of grief washed over her, the way they often did now. The way they would on and off for the rest of her life.

“Thank you for your kind words about our casualties. They knew the risks when we took up this work. They were willing to die for the Belt. I wish they hadn’t. I would like them here with me.

“I wish I could have done more.”

There was nothing else to say, so she sent the message. Then, like prodding at an infected wound, she pulled up a tactical report. The whole system lay before her. The *Panshin* still lived and a handful of others. The nakliye at Eugenia. And there, vector-mapped from the Jovian system out toward the ring, the *Pella*. The remnants of the Free Navy. Two other smaller dots were on intersecting paths, but when she checked their estimated course, it was clear they were all on the same mission. Marco and his loyalists would pour through the gate together. An unstoppable force. If the rail gun defenses had still been in place, it still would have been a hell of a fight. Without them, it would be a slaughter.

Then, station by station, ship by ship, she scrolled through the system. It was the equivalent of the grease-pencil grid she’d drawn in some other

lifetime, on a ship that was scrap and bad memories now. All of the things that people needed. Filters. Hydroponic supplies. Recycler teeth. Centrifuges for refining ore. Centrifuges for testing water. For working with blood.

She wondered if there were any colony ships still hiding out there in the emptiness, dark and watching in horror as humanity tore itself apart. She remembered the Doctrine of the One Ship. Remembered thinking of all the vessels in the Belt as being cells of a single being. She couldn't see it that way now. At best, they were all their own desperate bacteria floating on a vacuum sea that didn't care if they lived and didn't notice when they died.

And if Sanjrani was right, a worse collapse was only clearing its throat.

The door to the common corridor opened, and Josep slouched in. Nadia kissed him on her way to bed. Those were the shifts now. One to sit with Laura, one to sit with her, and one to sleep. A cycle of shared grief. Josep went to the food station, slid open a panel she hadn't noticed, and poured himself a glass of whiskey before he came to sit in the pit across from her.

"Skol," he said, raising his glass. The rim clinked against his teeth as he drank. For a moment, they sat there together in silence.

"Oops," she said.

Josep raised his eyebrows. "La magic word la."

"It was me," she said, wiping at her eyes with the cuff of her shirt. "I did what I always do, and I drove us straight to hell with it."

Josep's eyes were sunk back into his head. Exhaustion showed in his skin and the angle of his shoulders. "Don't follow your mind, me."

"I find someone, and I put my faith in them, and I go where they lead. And then all the gold turns to shit. Johnson and Ashford and Inaros. And now Holden. I don't know how I didn't see it coming, but I fell into it again with him. And now ..."

"Now," Josep agreed.

"And the stupid thing," she said, her voice rising a little, growing thin and sharp as the drone of a violin, "is that I look at all this? I look at everything I was trying to do, and none of it happened. Wanted to make the Belt for Belters, and it won't be. I wanted to build a place where we could live and call our own, and there isn't one. Isn't a way to build one even. I don't even remember now why I thought I should be on Holden's side. To open the gates again? Get the flow of colony ships freed up? Make sure that

none of the people I cared about would live?”

Josep nodded, his expression thoughtful and distant. “What would it mean if you’d dreamed it?” Josep asked.

“Dreamed what?” Michio said, shifting until her back hurt, and then shifting some more.

“This,” he said. “That you’d fought for Inaros and then for Holden. That you’d lost people precious to you and ended in a place of luxury and healing?”

“It wouldn’t mean shit.”

Josep grunted. “Could be prophecy.”

“Could be that the universe doesn’t give a shit about us or anything we do and your mystic bullshit’s just a way we try to pretend otherwise.”

“Could be that too,” he agreed with an equanimity that made her ashamed she’d said it. He took another drink of his whiskey, then put the glass on the floor and lay out full on the curving couch, his head coming to rest in her lap. His smile was warm and beautiful and filled with a humor and gentleness that made her heart ache.

“Didn’t follow Holden, us. Standing against Marco put Holden beside you, yeah. But you were never his. We didn’t fight Marco because of Holden. We fought because Marco said he was the champion the Belt needed, only turned out he wasn’t.”

“Yeah,” she said, stroking his hair.

He closed his eyes in exhaustion. “Aber, God *damn* but we’re still gonna need a champion.”

Chapter Forty-Nine: Naomi

Medina's system logs were huge, larger than anything Naomi had expected. And, what was worse, not very well organized. It was an artifact of history in a way. The physical design had been intended for a generation ship cruising through the still-unknown ocean of interstellar space, but the logic systems came from Fred Johnson's military refit, which had then been repurposed when the ship went from battleship to permanent city in space. The old security systems hadn't all been cracked when the Free Navy took over, so there were partial records here and there, scattered by a variety of engineers trying to force their will on an already complex system.

Like cities back on Earth where era had built on era had built on the era before, the systems of Medina were shaped by long-forgotten forces. The thinking behind each decision was lost now in a tangle of database hierarchies and complex reference structures. Finding something interesting was easy. It was *all* interesting on some level. Finding some particular piece of information—and knowing whether it was the most recent or complete version of the data—was very, very difficult.

She used her office in the security station like it was a medieval monk's cell, only leaving it to go back to the *Rocinante* to sleep, then coming back to it when she woke. Instead of copying ancient texts with pen and ink, she spelunked the datasets, poked through file systems, asked Medina to find things, and then watched to see where it didn't search. Anything that seemed like it might be useful she copied or stripped out and then sent back. Work report logs from the days under the Free Navy's control, sent back to Earth and Mars. Landing papers outlining the supply flow in from and back out to Laconia. Accident reports from the medical systems. Traffic control comm logs from the ships that had come and gone. Anything might be useful, so she took everything and sent it back at the speed of light to Earth and Luna and Mars and Ceres.

It kept the fear at bay. Not perfectly, but nothing short of death was going to end fear perfectly. No matter how she distracted herself, there was a timer ticking down in the back of her mind. The days and hours until Marco and his ships arrived. There were other problems, other risks—the Free Navy loyalists still on the station, the strobing do-not-approach signal that was the only thing coming out of the Laconia gate—but none of them would matter once Marco arrived. All of it pushed her to get her work done quickly, efficiently. When the next thing came—and she didn't look what that would be straight in its eyes—she wanted to know that she'd gotten her work done.

And still, sometimes she paused. She found a personal journal tucked among the environmental reports like printed pornography tucked under a mattress. Entry after entry of a young man's private struggles with his longings and ambitions and feelings of betrayal. Another time, she was trying to recover what she could from a half-erased partition and came up with a short video of a girl—four years old at most—leaping off a bed somewhere on the station, landing on a pile of pillows, and dissolving into laughter. Reviewing the traffic-control logs, she listened to the voices of desperate men and women from the systems on the far sides of the ring gates demand and beg and plead for the supplies they felt they deserved, wanted, and sometimes needed to survive.

It was the first time she'd really understood the scale of the destruction Marco had brought. All the lives he'd traumatized and ended, all the plans he'd shattered. Most of the time, it was too big to wrap her mind around, but little glimpses like this made it all comprehensible. Terrible and sad and enraging, but comprehensible.

And it informed some of her decisions.

"Um," Jim said, sloping in through the door of his office. "So, sweetie? Did you mean to have the data feeds go out through all the rings? Because I'm noticing that you've started sending everything to everyone."

"I meant to," Naomi said, brushing the hair back from her eyes. It was almost the end of her second shift. Her back ached a little from sitting too long in the same position, and her eyes were dry and scratchy. "I don't know what's going to be useful, or who it's going to be useful to. And since it doesn't look like we'll be on Medina long enough to go through everything, I thought I'd send copies out everywhere. Give other people a

chance to find whatever I'm missing."

"That's ... ah."

"I know," she said. "I may have been spending too much time with you. I'm starting to think like you. Only, well. The way you used to, anyhow."

"I still think like that," Jim said, pulling a chair over behind hers and sitting. He rested his head on her shoulder. When he spoke, she could feel the vibration in his throat against her skin. "I worry more that it's going to do something unexpected and terrible and huge that I'll be responsible for, but I still think that way."

"An unshakable faith in humanity."

"It's true," he said, shaking his head. Or maybe nuzzling a little. "Against all evidence, I keep thinking the assholes are outliers."

She leaned her head against him, taking a little pleasure in his simple presence. He had a peculiar scent, low and complex and pleasant as potting soil. She didn't think she'd ever get tired of it. And he hadn't shaved recently. The stubble of ragged whiskers tickled her ear like a cat's tongue. On the monitor, the data broadcasts ticked over another tenth of a percent. Somewhere in the office, Bobbie was talking, her voice familiar and strong. The air recyclers clicked and hummed to themselves, the soft breeze smelling like plastic and dust.

She didn't want to ask the question, but she couldn't hold it in either.

"Any news from home?"

She felt him tighten. He sat back, and the part of her skin he'd been against felt cooler without him. She turned her chair so she could look at him. His face had the artificial mildness that meant he was trying to downplay something, as if by treating it casually he could diminish it. She'd seen all his expressions so many times, she knew what he meant, whatever he said.

"They're coming. Free Navy. There's still no sign of activity from Laconia at all, but Avasarala's tracking fifteen ships converging on the gate. Mostly from the Jovian moons."

"Any chance they'll come through one at a time so Alex and Bobbie can shoot them?" she asked with a feigned innocence. It worked the way she hoped. Jim laughed.

"I'm pretty sure they're all going to come through like a rugby team. If we could get a couple of the rail guns from the station working again, I

think we'd have a chance. And some more rounds for them. Turns out shooting down a couple thousand targets can kind of burn through your supplies."

"Do we have a plan?"

"A couple," Jim said.

"Either of them good?"

"Oh, no. Not at all. Just different flavors of terrible."

The data feed chimed. The batch sent off, and waiting for Naomi to pick something else. More messages, more bottles. "All right. What are they?"

"The classics. Fight or flight. We've got the *Roci* and the boats that still work as boarding craft. One option is that we fill up the boats with troops, place them around the edge of the ring, and try to get people onto the Free Navy ships. It won't matter that they have ten times as many torpedoes as us if all the fighting's corridor to corridor. The *Roci* and Medina's defenses go after the ships we can't take control of. Massive slugfest, and hopefully we come out on top."

"And the chances that'll work?"

"Terrible, terrible chances. Very low. Dumb plan on every level. Much more likely that the boats will all get turned into metal shavings by Marco's PDCs before they even get close to boarding. And even if they do, those ships are going to have full crews to fight our people back."

"And flight?"

"Stock up the *Roci*, pick a gate, and get the hell out of Dodge before the bad guys show up in the first place."

"And leave Medina?"

"Medina. The *Giambattista*. Everything. Just turn tail and run like hell. Let the Free Navy hole back up in the slow zone and hope that the next wave the consolidated fleet sends can take it all back again and hold it next time."

"Where's the *Pella*?"

Jim sighed. "Oh, leading the howling pack."

Naomi turned back to her screen. "Then we're staying here."

"I haven't decided," Holden said.

"No, you haven't talked yourself into it yet," she said. "You know if we go, Marco's going to follow us. Maybe if we were a different ship or Marco was a different man, things wouldn't play out this way. We've got the

choice of fighting here, with a few allies and insufficient supplies, or fighting on the far side of a ring gate with even less. That's the only distinction."

"I ... well ..." Jim took a deep breath, blew out. "Shit."

"How much of the debris from the wave of decoys can we police up?"

"Anything that hasn't drifted out past the rings," Holden said. "You're thinking put it all just inside the Sol ring and hope the Free Navy runs into it?"

"The gate's not that big," Naomi said.

"Three-quarters of a million square clicks," Holden said. "And fifteen ships coming through it. Even if we turned all our scrap metal into sand, the Free Navy's more likely to miss them and not even know they were there."

"I know," Naomi said. "But maybe one will get a lucky hit. And then there'll be one less. If we aren't playing the long shots, we're giving up. Long shots are all we've got left. And even if we lose—"

"I'm not looking at—"

"*Even if we lose*," Naomi said, "how we lose matters. You didn't set yourself to be a symbol of anything. I know that. It's just something that happened. But after it happened, you used it. All those video essays you put out, trying to show everyone that the people on Ceres were just people?"

"Those weren't about me," Jim said, but the guilt in his voice said he didn't believe it.

"They were you using the famous Captain James Holden to make people look at what you needed them to see. Don't be ashamed of that. It was the right thing to do. But everyone out there who saw them? Who made their own versions of them and added to the project of trying to remind each other that war isn't all ships and torpedoes and battle lines? If we're going to ..." Her throat was tight now. The words stuck there. "If we're going to die, we should make it mean at least as much as your video pieces did."

"I don't know that those mattered," Jim said. "Did they do anything?"

"You don't get to know that," Naomi said. "They did or they didn't. You didn't put them out so that someone would send you a message about how important and influential you are. You tried to change some minds. Inspire some actions. Even if it didn't work, it was a good thing to try. And maybe it did. Maybe those saved someone, and if they did, that's more important than making sure you get to know about it."

Jim sank down into himself. The mask of himself that he'd worn since Tycho slipped a little. She saw the despair under it.

"I shouldn't have come here," he said.

"You took this on because it was the risky job," she said. "You did it because it needed doing, and you don't ask people to take things on you wouldn't do yourself. Just like when you ran onto the *Agatha King*. You don't change, Jim. And I knew that coming in. We all did. We thought we'd make it, but we knew we might be wrong. We were wrong. Now we have to do this next part well too."

"Getting killed. This next part is getting killed."

"I know," she said.

They were silent, the two of them. Bobbie's voice, as far away as the stars, turned briefly to laughter.

"The videos were just stupid little art projects," Jim said. "Dying's not an art project."

"Maybe it should be."

He hung his head. She put her hand on it, feeling the individual strands of hair against her fingertips. The tears in her eyes didn't sting. They flowed gently, like a brook. There was no way to tell him all of it. The guilt she felt for bringing them all into Marco's orbit. The certainty in her heart that if she'd just seen what Marco Inaros was in time, none of them would have been in this position. If she said it, Jim would feel like he had to comfort her, to be strong for her. He'd close back up into himself. Or no. Not himself. Into James Holden. She liked Jim better. One long breath. Another. Another. The quiet intimacy of a perfect moment.

"Hey," Bobbie said, stepping into the room. "Do either of you—um. Sorry."

"No," Jim said, wiping his eyes with the back of his hand. "What's up?"

Bobbie lifted her hand terminal. "Do either of you know if we sent the incident reports on the missing ships to Luna? Avasarala said her science monkeys are really champing at the bit for those."

Naomi took a long, shuddering breath and then smiled. Perfect moment over. Back to work. "I'll get right on it."

"Okay," Bobbie said, stepping backward out of the room. "Sorry if I ... you know."

"Have you eaten yet?" Jim said, standing up. "I don't think I've had

anything since breakfast.”

“I was going to after I was done here.”

“Could you two bring me a bowl of something?” Naomi said, turning to her monitor again.

The BATCH COMPLETE message had given up on her and dropped back to her file-system prompt. She spooled through the traffic logs as Jim and Bobbie called back to the *Roci*. Their voices—Jim, Amos, Alex, Bobbie—mixed together. A little conversation about food and beer, who wanted to be together and who wanted to be apart. She had to force herself to concentrate. The log structure was a mess, one manager doing things one way, the next picking another.

It took the better part of an hour to be sure she’d gotten the data from all the times ships had gone missing. Some of them, she’d already seen back on Luna, but there were more that she hadn’t. Almost two dozen ships had vanished, including, it seemed, one of the stolen Martian ships heading for Laconia. Ships from the colonies. One of the transport ships delivering for the Free Navy too. All sides had lost something.

Which was interesting.

She prepped the data package for Luna. This one, she encrypted. But as it sent, she reviewed her own copy again. The missing ships tended to be larger, but weren’t always. They seemed to vanish most in high-traffic times ...

Alex brought her a bowl of noodles and mushrooms and a bottle of Medina-brewed beer. She was pretty sure eating it that she’d remembered to thank him. Not positive, though. There was a correlation if she plotted the high-traffic times to the incidents ... No. This was wrong. She was looking at it the wrong way. They didn’t just need to look at when things had happened. They needed to look at all the times Medina had seen similar conditions—high traffic, large-mass ships, mistuned reactors—and *nothing* had gone wrong. She scooped up the full flight data partition and started streaming it down toward Luna too, but she couldn’t let it go.

Her back ached. Her eyes hurt. She didn’t really notice. Here was a dataset built of high-traffic periods with and without mysterious disappearances. Here was one mapping the energy output and mass of the missing ships and trying to fit that curve against ships that had sailed

through safely. The full encrypted dataset sent to Luna announced it was complete, which seemed awfully fast until she checked how long she'd been sitting there.

Five variables—preceding mass, preceding energy, mass of the ship, energy of the ship, and time. No single-point solution, but a range. A moving system of curves, rising with preceding mass and energy, falling with time, and, where the mass and energy curve of the other ships intersected it, disappearances. It was as if traffic passing through the gates created a wake, and when something large enough and energetic enough struck that wake, it vanished.

Her hands were trembling as she pulled her terminal out of her pocket. She didn't know if it was emotion or exhaustion or if the noodles and mushrooms had been so long ago she just needed to eat. Jim picked up the connection almost as soon as she requested it.

"Hey," he said. "Are you all right? You didn't come back to the ship last night."

"No," she said, meaning no she hadn't gone back to the ship, not no she wasn't all right. She waved the imprecision of the word away. "I think I have something interesting here. I need someone to look at it for me in case I'm just hallucinating from exhaustion."

"I'll be right there. Should I grab anyone else? What sort of 'interesting' are you looking at?"

"It's about the missing ships."

On the little screen, Jim's eyebrows rose. His eyes went a degree wider. "Do you know what's eating them?"

She blinked. On her monitor, two equations, five variables. Years of traffic logs to draw from. It was a perfect fit. Surely Luna would be able to confirm it.

But *Do you know what's eating them?*

"I don't," she said. "I know something better."

Chapter Fifty: Holden

It's not a huge dataset," Naomi said, turning as she reached the edge of the room and pacing back toward him. "I mean, it's the largest there is. There's not more out there we could get."

"Is that a problem?" Holden asked.

She stopped, stared at him, her hands wide and hard in a universal gesture of *Of course it's a problem*. "It may not scale. There may be other variables at work that just haven't come into play in these instances. If you wanted me to build an engine based around data like this, I wouldn't do it. Shit, an engine. I wouldn't trust a *ladder* based on this. Except that ..."

She started pacing again and chewing at the nail of one thumb. Whatever her exception was, she'd already moved on in her mind. Holden folded his arms, waited. He knew her well enough to recognize when she needed a little mental space. He looked down at the graphs on her screen. They reminded him of a heart monitor, but the shapes of the curves were very different. He was pretty sure that with an EKG, the initial spike went back down under the baseline. With this, there was a rapid rise, then a slow, sloping falling away.

No one else had come to the security station yet. Probably, they were all still on the *Rocinante*, eating breakfast in the galley. Or maybe stopping at one of the little kiosks in the docks where the locals still took their scrip.

Naomi stopped beside him, her gaze on the screen with his. Her lips twitched like she was talking to herself, having a heated conversation no one else was welcome to. Not even him. She shook her head, disagreeing with herself. She'd seemed calmer when she'd first called, but the more they talked about it, the more agitated she became. The more frightened, even.

It looked like she was starting to hope.

"So this thing. Is it a thing we can use?"

“I don’t know what it is. The mechanism? I’ve got no idea. All we have is this pattern, but it looks so *consistent*.”

He tried again. “Is this a consistent pattern we can use? And specifically, is there something here that maybe gives us a third alternative in that ‘stay here and be slaughtered versus run away through one of the gates and be slaughtered’ conversation?”

She took a long, deep breath and let it out slowly between her teeth. He’d kind of hoped she’d laugh, but she didn’t. She sat at her workstation again, pulled up a complex equation that Holden couldn’t follow.

“I think,” she said, “we can simulate a high-traffic interval. Load the *Giambattista* with as much junk as we can weld on it. Overload the reactor a little so it’s generating more energy. Then, when we run it through a gate”—she tapped the spike-and-decay curve—“we should get one of these. Not a big one, though. Even a massive ship is only one ship ...”

“And one of these is what?”

“It’s an obstacle. It’s something that the Free Navy ships may run into. If their ships have enough mass and enough energy that this line crosses the curve before it dies away ... I think they just stop.”

“Meaning they go where all the other eaten ships go?”

Naomi nodded. “We could put extra mass in the *Giambattista*. We’ve still got those attack boats. Some of them have fuel left in their drives. If we put them through at the same time, we could increase the curve a little. And Marco will almost certainly bring all his ships through at once, so that might help us. But I don’t know the *mechanism*—”

“Hey,” Holden said. “Do you know what Planck’s constant is?”

“Six point six two six plus change times ten to the negative thirty-fourth meters squared kilos per second?”

“Sure, why not,” Holden said, raising one finger. “But do you know why it’s that and not six point seven whatever the rest of it was?”

Naomi shook her head.

“Neither does anyone else. They still call it science. Most of what we know isn’t *why* things are what they are. We just figure out enough about how they work that we can predict the next thing that’s going to happen. That’s what you’ve got. Enough to predict. And if you think you’re right, then I do too. So let’s do this.”

She shook her head, but not at him. “A massive *n* equals one study

where our null hypothesis is that we all get killed.”

“Not necessarily,” Holden said. “They only have fifteen to our one. We might still take them. We have Bobbie and Amos.”

This time she did laugh. He put his arm under hers, and she leaned against him. “If it doesn’t work, we won’t be any more fucked than we are now,” she said.

“Probably not,” Holden said. “I mean, weird, dead alien technology with effects we don’t understand sweeping whole ships away without leaving a trace or explanation. That’s probably safe to play with, right?”

The *Pella* and her fourteen warships—all that was left of the Free Navy—came closer to the ring, already past their halfway point and on their braking burn. Avasarala had sent a list of the tactics she was using to try to slow or stop the attack days before, and with a heaviness that said she knew it was all bullshit even before she got around to making it explicit. She’d ended with *I’ll do whatever I can, but you might have to make do with being avenged. Sorry about that.* He wondered what she’d have thought about Naomi’s discovery and their plan.

Holden felt every hour that passed, knowing Inaros and his soldiers were a little nearer. It was like someone pushing at his back, making him hurry. It would almost have been easier if it had been hours and days. At least it would have been over.

The captain of the *Giambattista* misunderstood at first, thinking that his ship would be lost to the whatever-it-was that the gates did. Naomi had to explain to him four different times that if it went well, the *Giambattista* would just sail into some other system, loaf around there for a few days, and then come back, unharmed. Once she convinced him that, even if it failed, it meant he and his crew would miss the battle, his objections evaporated.

Naomi coordinated it all—loading the boats back into their positions in the hold, retuning the reactor so that both the bottle and the reaction were working almost at the edge of their capacity. She took Amos and Clarissa with her to backload the *Giambattista*’s internal power grid so that

everything was on the verge of overload without ever quite tripping. It reminded Holden of Father Tom telling him about bears when he was young. If a black bear wandered onto the ranch, the thing to do was to open your coat and raise your arms over your head, shout and make noise. If it was a grizzly, the only thing to do was very quietly to get as far away as you could. Only this felt like they were making noise at a grizzly in hopes that it would eat the other guy.

While Naomi made her preparations, he tried to make himself useful.

There were backlogs of communications from the colony worlds. Status reports and threats and begging. It was sobering to remember how many planets humanity had already spread to. How many seeds they'd planted in strange soils. With Naomi's flood of information just gone out, a lot of the colonies were only now beginning to understand why they'd been cut off. Only now hearing about what had happened to Earth and its solar system. The messages coming back flooded the comm buffers with rage and sorrow, threats of vengeance and offers of aid.

Those last were the hardest. New colonies still trying to force their way into local ecosystems so exotic that their bodies could hardly recognize them as life at all, isolated, exhausted, sometimes at the edge of their resources. And what they wanted was to send back help. He listened to their voices, saw the distress in their eyes. He couldn't help but love them a little bit.

Under the best conditions, disasters and plagues did that. It wasn't universally true. There would always be hoarders and price gouging, people who closed their doors to refugees and left them freezing and starving. But the impulse to help was there too. To carry a burden together, even if it meant having less for yourself. Humanity had come as far as it had in a haze of war, sickness, violence, and genocide. History was drenched in blood. But it also had cooperation and kindness, generosity, intermarriage. The one didn't come without the other, and Holden had to take comfort in that. The sense that however terrible humanity's failings were, there was still a little more in them worth admiring.

He did what he could to answer the most pressing messages, offer what hope he could. The voice, however briefly, of Medina Station. Coordinating supplies for all the colonies was more than he could manage. It would be full-time work for a staff of dozens at least, and he was only one man with a

radio. Still, just seeing the need, dipping his toes into the oceanic task of being the physical hub of a thousand different solar systems, gave him a covert sense of hope for the future.

He'd been right. There was a niche here.

Providing the plan worked. Providing they didn't all die. Providing that any of a million things he hadn't even thought of yet didn't swing through and destroy everything he was still looking for and planning. There was always the forgotten arm. The thing you didn't see coming. Hopefully, the thing Marco Inaros wouldn't see coming either.

“So how long is this window or wake or whatever it is that we’re shooting for?” Amos asked.

Time was almost out. The question now was just how fast Inaros wanted to be going when they came through the gate. If he cut the braking thrust and came through fast, it would throw off the timing. If the *Giambattista* went through the Arcadia gate too late, it would be the one to quickly, quietly vanish away. If it went through too early, Naomi’s curve would already have decayed down to nothing and the Free Navy would pass into the slow zone in safety.

They’d gone back to the *Rocinante*. Alex and Bobbie in the cockpit, ready for battle if battle came. Holden and Naomi were strapped into the couches in the command deck. Amos, on float, had come up for the company as much as anything else. They weren’t at battle stations yet. If it came to that, this was probably the last time he’d see Amos in the flesh. Holden tried not to think about it.

“It’ll be maybe five minutes,” Naomi said. “Part of that’s going to depend on the mass and energy of the ships they bring through. If we’re lucky, maybe as much as ... ten?”

“That ain’t much,” Amos said with an amiable smile. He put a hand on the ladder up to the cockpit to keep himself from drifting. “You good up there?”

“Good as gold,” Alex said.

“If this trick of Naomi’s doesn’t go, you think we can take ’em?” Amos

said.

“All of them, probably not,” Bobbie called down. “Some of them, for sure.”

Clarissa rose up from the lift, a pale smile on her lips. She’d spent enough time on the float now to be natural with it. She moved from grip to grip along the wall like she’d been born a Belter. When she got to Holden, she held out a bulb from the galley.

“You said you hadn’t been able to sleep,” she said. “I thought you’d want some coffee.”

Holden took it; her smile widened a degree. The bulb was warm against his palm. Probably it wasn’t poisoned. She wasn’t really likely to do that anymore. He steeled himself a little before he took a sip.

Medina Station was in the hands of the OPA fighters from the *Giambattista*, not that it would do much good. Its PDCs and torpedoes had, for the most part, been spent defending against Holden. What was left was a rounding error on what they’d have needed to hold back Inaros. The *Roci* was waiting almost behind the blue station at the center of the slow zone. If he’d trained the ship’s cameras on it, he could have seen the ruins of the rail guns as clearly as if he’d been standing over them.

“Anything coming out of Laconia?” he asked.

“We don’t have a repeater on the far side of that gate, but just peeping through the keyhole? Nothing,” Naomi said. “No signal. No sign of approaching drives.”

The *Roci* chirped out an alert. Holden pulled it up.

“Got something, Cap?” Amos asked.

“Incoming ships have changed their burn a little. They’ll be coming in fast.”

“And early,” Naomi said. Her voice was like someone talking through pain. The *Roci*’s countdown timer adjusted itself, estimating that the enemy would come through the ring gate in twenty minutes. Holden washed the lump in his throat with Clarissa’s coffee.

Clarissa pushed over to Naomi’s couch, her sharp face bent by a frown. Naomi looked up at her and wiped her eyes. A droplet of a tear floated in the air, drifted toward the recycler intake.

“I’ll be all right,” Naomi said. “It’s just that my son’s on one of those ships.”

Clarissa's eyes sheened over too and she put a hand on Naomi's arm. "I know," Clarissa said. "If you need me, you can find me."

"It's okay, Peaches," Amos said. "Me and the captain had a talk about it. We're good." He gave Holden a cheerful thumbs-up.

The timer ticked down. Holden took a long, slow breath and opened his channel to the *Giambattista*.

"Okay," he said. "This is Captain Holden of the *Rocinante*. Please begin your passage burn now. I need you to go through the gate in"—he checked the timer—"eighteen minutes."

"Tchuss, røvul!" the *Giambattista*'s captain said. "It has been, sí no?"

The connection dropped. On the screen, the *Giambattista* reported a hard burn starting. Holden shifted the display to show it. A single bright star in the blackness. A drive plume wider than the ice hauler that it was driving. He wanted to believe there was something off about the color of the light, as if the high-energy tuning Naomi had done with it was visible to him, but that was just his mind playing tricks. A new counter appeared on the display. The *Giambattista*'s expected passage through the Arcadia ring went from seventeen minutes to sixteen. The Free Navy's arrival—unless they altered course—through the Sol gate in nineteen. Eighteen.

Holden's gut was tight. His breath shuddered, and he drank another sip of coffee. He opened a second window, sensors trained at the Sol gate. From where they were, the Free Navy wouldn't be visible. Not yet. The angle was off just enough to hide them.

"Do we have the rail gun ready in case they get through?"

"Yes, sir," Bobbie answered smartly.

"Well," Amos said. "Me and Peaches better go strap in. You know. In case."

Clarissa touched Naomi's shoulder one last time, then turned and launched herself, following Amos down the lift toward engineering. Holden took a long, last drink and stowed the coffee bulb. He wanted it over. He wanted this moment to last forever in case it was the last one he had with Naomi. And Alex and Amos. Bobbie. Hell, even Clarissa. With the *Rocinante*. You couldn't be in a place like the *Roci* for as long as he had been and not be changed by it. Not have it be home.

When Naomi cleared her throat, he thought she was going to talk to him.

"*Giambattista*," she said. "This is the *Rocinante*. I'm not showing your

internal power grid above normal.”

“Perdona,” a woman’s voice came back. “Fixing that now.”

“Thank you, *Giambattista*,” Naomi said and dropped the connection. She smiled over at Holden. The horror of the situation was only a line at the corner of her mouth, but his heart ached to see it all the same. “Amateurs. You’d think they’d never done this before.”

He laughed, and then she laughed with him. The timers ticked down. The *Giambattista*’s reached zero. The brightness of the drive plume blinked out, hidden by the curve of the Arcadia ring and the profound weirdness that was distance and space here. Where that timer had been, Naomi put up a display of a mathematical model she’d built. The spike of the *Giambattista*’s passage already starting to decay.

The line sloped down as, beside it, the timer for Marco’s arrival turned to seconds. In the cockpit, Bobbie said something and Alex answered. He couldn’t make out the words. Naomi’s breath sounded fast and shallow. He wanted to reach over to her. To take her hand. It would have meant taking his eyes off the monitor, and so he couldn’t.

The Sol gate flickered. Holden increased the magnification until the ring filled his screen. The weird, almost biological structures of the ring itself seemed to shift and writhe. An illusion of light. The drive plumes of the Free Navy ships packed in together so tightly that it looked like one massive blaze of fire appeared on the edge of the ring, tracking in toward its center.

“You want me to take a potshot at them?” Bobbie asked. “Rail gun could probably reach them at this point.”

“No,” Naomi said before Holden could answer. “I don’t know what sending mass through the gates right now would do.”

A line appeared on the model, low on the scale. Moving toward the dying curve. The ring gate grew brighter with the braking burns of the enemy, until it looked like the negative image of an eye—black, star-specked sclera and intensely white, burning iris. The timer reached zero. The lights grew brighter.

Chapter Fifty-One: Marco

Marco's jaw ached. His chest hurt. The joints in his spine hovered at the edge of dislocation without ever passing through to it. The high-g burn scourged him, and he welcomed the pain. The pressure and the discomfort were the price his body paid. They were slowing on approach. The core of the Free Navy was going to reach Medina unopposed, and there was literally no one to stop it.

At a civilized thrust—an eighth, a tenth—and with some time coasting on the float to conserve mass, the journey out to the ring gate would have taken months. He didn't have months. Everything depended on reaching Medina before the scattered forces of the consolidated fleet could reach him. Yes, it meant driving the ships he had to the edge of their ability. Yes, it would mean putting some of the reserves from Medina under conscript to fuel his return to the system, and the people of Medina would have to make do with a little less until he could stabilize the situation enough to allow resupply.

This was wartime. The days for scrimping and saving and safety were gone. Peace was a time for efficiency. War was a time for power. If it meant he drove his fighters to the ragged edge of their ability, that was how victory came. Those who held back the most reserves for tomorrow were the ones least likely to see it. If the price was long days of unrelieved discomfort and pain, he'd pay that price and glory in it. Because at the end, there was rebirth. A shedding away of all his little missteps, a purification, and the seat of his final, permanent victory. And it was coming soon.

His error—he saw it now—was in thinking too small.

He had conceived the revolution that the Free Navy represented as a balancing of the scales. The inners had taken and taken and taken from the Belt, and when they didn't need it anymore, they'd dropped it and fled off to new, shinier toys. Marco had meant to put that right. Let the inners be the

ones in need and the Belt find its independence and its strength. It was anger that had kept his view too small. Righteous anger. Appropriate anger. But blinding all the same.

Medina was the key, and always had been. But it was only now that he saw what it was the key to. He'd meant to close the gates and force the inner planets to address the consequences of generations of injustice. Looking at it now, it almost seemed like a gesture of nostalgia. A harkening back to previous generations. He'd made the classic mistake—he wasn't too proud to admit it—of trying to fight the last war on the next battleground. The power of Medina wasn't that it could stop the flow of money and material out to the new worlds. It was that it could *control* it.

The fate of the Belt wasn't around Jupiter and Saturn, or at least not those alone. In every one of the thirteen hundred systems that the gates led to, there were planets as vulnerable as Earth. The Belt itself would spread to all the systems, float like kings above all their subject worlds. If he had it all to do again, he'd have thrown three times as many rocks on Earth, destroyed Mars while he was at it, and taken his ships and his people to the colony worlds where there were no vestigial fleets to consolidate. With only Medina and the fifteen ships at his disposal, he could exert power over all the worlds there were. It was all about placement, audacity, and will.

He needed to find a way to talk Duarte into giving him a few more ships. But the promise to keep Laconia undisturbed had earned him everything he'd needed up to now. He didn't think another small request would be too much, especially given how much he'd sacrificed already. And if Duarte did object—

The *Pella* shuddered as the drive passed through some resonance frequency. Normally when that happened they weren't under high burn. It was strange how something that was hardly more than a chime at a third of a g could sound like the coming apocalypse at two and a third. He tapped out a message for Josie down in engineering: KEEP US IN ONE PIECE.

A few seconds later, Josie wrote back something obscene, and Marco chuckled through the pressure on his throat.

They'd taken their last respite before the battle four hours earlier, dropping the deceleration to only three-quarters of a g for fifteen minutes to let people eat and visit the head. A longer break would have meant burning

harder now, and they were already running at the edge of their tolerances. But the advantages of an unexpected forced march were scattered through the great military strategists of history. Earth and Mars could only look on, eyes pressed to their telescopes, and wail. Earth and Mars and Medina too.

And on Medina, Naomi and her feckless Earther fuck buddy. James Holden, following in Fred Johnson's footsteps as condescending, patronizing hero of the poor, helpless Belt. When he died, the story of a Belt that had to be saved by self-congratulatory, faux-enlightened Earthers would bleed out with him, and good riddance. And Naomi ...

He didn't know yet what to do with Naomi. She was a conundrum. Strong where she should have been weak and weak where she should have been strong. It was like she'd been born inverted. But there was something about her. Even after all these years, there was something about her that begged to be tamed. She'd slipped away from him twice now. Whatever happened, there wouldn't be a third time. Once he had her in hand, Filip would return on his own. That wasn't worth worrying about.

When Filip had missed the launch from Callisto, Marco hadn't been surprised. The boy had been acting out for weeks. It was normal. Even late, really. Marco had tested Rokku's authority when he'd been much younger than Filip was now. Rokku had told him when to be there for launch, and Marco had intentionally come late to find the berth empty. He'd had to fend for himself on Pallas Station for seven months before Rokku's ship came back. The captain had met him on the dock and beaten him until he was bleeding from a dozen places, but Marco had been taken back in. If Filip needed the same experience, that would be fine.

Not that Marco would beat him. Better that he laugh a little and muss the boy's hair. Humiliation was always better than violence. To beat a man—even to beat a man to death—was at least proof that you took him seriously as a man. Though, looking back, Filip had really been starting to push as far back as when he'd shot the security coyo on Ceres. And God, Marco's jaw ached.

He shifted his fingers, pulled up the timer. The ring gate was only minutes away now. The *Pella* was shedding momentum with every second, making certain that when they passed through the gate, they wouldn't fly into a trap. Holden would be waiting. Watching the fire of their drive plumes. They weren't close enough yet for that to be a danger. Even if

Holden fired his rail gun right now, the *Pella* would be able to react in time to dodge it. That wouldn't be true much longer. His compressed heart beat a little faster. His aching mouth twitched a little smile.

But discomfort was the home of the warrior, now as it had always been. He told himself that he embraced it. Welcomed it. And still, he was going to be glad when this part was done.

He typed in orders for the full force, gathering them in close enough that their drive plumes overlapped, using the vast, energetic cloud as cover to hide behind. Between that and the sensor interference of the ring, Holden would be firing as good as blind. Or at least that was the hope. The worst case was that Holden might take out two or three of his ships before they passed through the ring. But once they came close enough to target the *Rocinante*, crippling the ship would be nothing. Not destroying it, not unless they got unlucky. Trotting out James Holden's famed ship as part of the new Free Navy was too good an opportunity to miss. That was what Sanjrani and Dawes—all the others—missed. Leadership required a clear sense of appearance. Of *style*.

Fifteen minutes. Billions of people were watching him right now. As fast as the photons could travel back, the *Pella* and its fourteen fighting ships would be on every newsfeed, every hand terminal, every monitor in the system. He was fifteen minutes from the hinge point in history. Fourteen.

He checked their common vector. Coming into enemy territory, it was critical that they be neither so close together that a lucky hit by Holden could damage more than one ship nor staggered to give him time to take more shots. They looked good. They would be all right.

He wished now that he'd thought to make a recording to broadcast. It was the perfect moment. Even better than his initial call to arms. He thought of all the Belters in the system—those who'd stood by the Free Navy and those who'd been too cowardly or misguided and even the traitorous fragments of the OPA who'd taken arms with Pa against their own self-interest. He had to believe they all felt a sense of pride. Before him, they'd been slaves in all but name, and now they were a force equal to and stronger than the most powerful states humanity had ever conceived. How could they not feel awe at this? How could they not feel the joy in this?

The ring was close enough to see without magnification now. As wide as Ceres Station and still tiny in the vast darkness out here where even the sun

wasn't more than a peculiarly bright star. His ships would start evasive maneuvers as they drew close. Shifting places in their formation like shells on the table of a dockside hustler. He checked their vectors again, typed out an angry command to one of the ships that was drifting behind. The ring slowly grew larger. He increased the magnification and added false light. The material that made up the ring itself still defied the best minds in the human sphere. He wasn't really seeing it, of course. The image on his monitor was filtered through the brightness of their plumes. In truth, he was falling backward toward the ring, his face toward the faint and unimportant sun. His crash couch held him like he was resting in the palm of God.

A message appeared on his monitor from Karal: ALL SYSTEMS CHECK. BOA CAÇADA.

Marco typed back, not just to Karal, but to all of the *Pella's* crew. GOOD HUNTING.

Five minutes until they passed through the gate and the battle for Medina began. The brief, decisive, ugly battle that would redefine what the Free Navy was. He willed them forward, pushing against brute physics with his mind. Smelling victory. Feeling it in his blood. Minutes slid by like hours, and also gone too fast. Two minutes. One.

Another message from Karal. WIR HAT POSSIBLE.

Beside it was deeper magnification of the ring filtered through the ship's system. A tiny blue dot that had to be the rail gun station, and there beside it, almost too subtle to see, a fleck of lighter darkness that could have been a ship on the float. The *Rocinante*.

Marco felt his whole consciousness narrow into that one tiny gray dot. Naomi. That dot was Naomi. She'd run out of the solar system to get away from him, and here he was. He could see her face in his mind. The empty expression she wore when she was trying not to feel. His grin hurt. His body hurt. But the little dot forgave it all. Except—

Something was wrong with his monitor. He thought at first that the image had gotten grainy, the resolution rougher, but that wasn't right. It was the same size, only he could see the parts that made it up. He wasn't looking at the *Rocinante*. He was looking at photons streaming off a sheet of electrically excited plastic. The polymer chains glowed dark and light and dark. It was like seeing a woman's body in painting across the room

and then, without warning, only the brushstrokes that made it up. Naomi was nowhere in it.

He shouted, and could sense the pressure waves going out from his throat. The clouds of molecules that made his fingers slapped against the ones that were the control pad. He meant to type that they should fire, that they should kill while the chance was still with them, but he couldn't make out the letters in the splash of photons that spilled off his screen. There was too much detail.

Where the air began and the crash couch ended was lost. The boundary between his body and his environment blurred. He had known since he was too young to remember learning that atoms were made from more space than material, and that at the lowest levels, the things that made atoms could bounce in and out of being. He'd never seen it before. He'd never been so aware that he was a vapor of energy. A vibration in a guitar string that didn't exist.

Something dark and sudden moved through the cloud toward him.

On the *Rocinante*, the ring gate grew brighter with the braking burns of the enemy, until it looked like the negative image of an eye—black, star-specked sclera and intensely white, burning iris. The timer reached zero. The lights grew brighter. Then flickered and went out.

Holden checked the sensors. Where fifteen warships on the burn had been seconds before, there was just *nothing*.

“Huh,” Amos said over the ship system. “That is super creepy.”

Chapter Fifty-Two: Pa

Here we are. Back again,” Michio said as she stepped onto the docks of Ceres Station.

“Hup,” Josep, walking beside her, agreed.

When she’d left, she had been rebelling against a rebellion. Now she had come, whether anyone admitted it or not, to beg the powers of Earth and Mars for her freedom. She felt like the docks themselves should have changed too. Grown older and more worn the way her soul had. But the echoing music built from the clanking of mechs and power tools, the gabble of voices, was what it had been before. The smells of carbon lubricants and ozone was still as sharp.

A new coat of paint even left the old station looking brighter and younger and more full of hope than when she’d left. The signs had been replaced. The same corridors and lifts, but in bright, clean new fonts and half a dozen alphabets. She knew it was designed for the colonists and refugees fleeing Earth, but it seemed pointed that, of the languages listed, none was Belter Creole. Earth ran Ceres again, the way it had before Eros, and they were turning the station into a theme-park version of itself. The guard was for the most part ceremonial, but Michio was more than willing to bet their sidearms were loaded. It was awkward work, welcoming someone who was equal parts ally and enemy. She didn’t envy them.

It had been six months now since the remarkable death of Marco Inaros and the great remnant of the Free Navy. Half a year just to bring the remaining players together to talk. She wondered how long it would take to actually do something that mattered. And what would happen when they all ran out of time. She felt like she had a tiny Nico Sanjrani in the back of her head counting down the hours until the Belt—no, until all humanity—needed the farms and medical centers and mines and processing facilities that they hadn’t built because they’d been too busy fighting. Some nights it

kept her awake. Some nights other things did.

She was half expecting them to take her to the same quarters Marco Inaros had assigned the last time she'd been here hammering out a plan for the Belt, but while it was in the same section of the station, the particular rooms were different. Their escort finished welcoming them, assured them that if they needed anything, someone from the hospitality service would be there to help. They bowed their way out the door, closing it as they left. Michio lowered herself to the couch in the suite's main room while Josep made his way through each of the rooms, taking stock and looking for surveillance equipment that was both certainly there and certainly too professionally installed to find.

Nadia, Bertold, and Laura were back on the new ship—a converted cargo hauler on loan from one of Bertold's cousins as long as they found ways to make the payments on it. After the sleekness and power of the *Connaught*, it felt cheap and flimsy. But her family was on it, so it was home in the same way that the couch her cheek rested against was raw-silk upholstery in a jail cell.

Josep's laugh was hard. He walked back into the room with a rectangle of something the color of cream and held it out to her. Not paper, but heavy card stock smooth as the couch. The writing on it was neat and precise.

Captain Pa—

Thank you for coming to the conference and for your courage in the struggles we have all endured together. With good faith and cooperation, we will forge the path still ahead.

It was signed Chrisjen Avasarala. Michio looked up at Josep, her brow knit.

“En serio? That doesn't even sound like her.”

“I know,” he said. “And come see! There's a fruit basket.”

If wars began with rage, they ended with exhaustion.

In the aftermath of the system-wide battle and its unsettling aftermath at the ring, the partisans of the Free Navy had felt an overwhelming sense of injustice. It was as if the disappearance of the *Pella* and its battle force had been a bad call in a football match, and they were trying to find a referee to shout down. Then, slowly, the understanding seemed to spread through all the stations—Pallas, Ganymede, Ceres, Tycho, and dozens more besides—that the war was ended. That they'd lost. A group on Pallas had issued a declaration that they were the New Free Navy and had set off a few bombs when the consolidated fleet arrived to take control of the station. The Jovian system—Callisto, Europa, Ganymede, and all the lesser bases there—had been the Free Navy's strongest ground and the one least touched by the fighting. A few patches of resistance there meant the violence would drag on for a few more weeks or months, but the outcome wasn't in doubt.

The specter of the Laconia gate and Winston Duarte hung over Mars more than anyone else. Martian identity—proud cogs in the glorious terraforming machine—didn't square with military coups and mass defection. Mars wanted answers, and Laconia ignored them all magnificently. The only communication since the death of the Free Navy was a looped statement broadcast through the gate. A man's voice, inflected like a newsreader's, saying, *Laconia is under its own sovereign authority. This message serves as notice that any ships passing through the Laconia gate will be in violation of that authority and will be denied passage. Laconia is under its own sovereign authority ...*

The message had caused no end of debate in the Martian parliament while Earth drove two of its three remaining battleships out to the slow zone and parked them and their ancient but effective rail guns and nuclear torpedoes at the edges of the Laconia gate, ready to reduce anything that came out to gas and scrap. Avasarala called it a containment policy, and Michio supposed it was the sanest thing to do. Earth was in no condition to pick another fight.

By the time Rosenfeld Guoliang took the stand in The Hague, the first high-profile prosecution for the murder of billions on Earth, the vast and complex human zeitgeist was ready for it to be over. There would be other trials coming. Anderson Dawes had been captured. Nico Sanjrani turned himself in at Tycho. Of Inaros' original inner circle, Michio Pa was the only one not in a cell or dead. And she was at a cocktail party.

The meeting center in the governor's palace was built on three levels with stairways between them and a lot of plants. People in uniform and formal dress stood in pairs or small groups or alone with their hand terminals while servants carried trays of hors d'oeuvres and drinks. If anything specific was wanted—food or drink or a fresh pair of shoes, probably—they had only to ask. The lap of luxury. The highest circles of power and influence.

This was the real thing, something that Marco Inaros had only been able to play at. The stone walks were polished and the pillars were made of striped sedimentary rock pulled all the way from Earth as a kind of boast. *We're so rich, we don't even use our own stone.* She'd never noticed it before, and she didn't know whether it left her amused or angry or sad.

"Michio," a woman's voice said. "Here you are. How is Laura?"

The old lady in the orange sari took Michio's elbow and led her along almost three full steps before she realized it was Avasarala. The old Earther looked different in person. Smaller, her skin a deeper brown, her pale hair taking up more of her face.

"Much better," Michio said. "Back on the ship."

"With Nadia and Bertold? And Josep stayed back in your rooms? Just so long as they know they're welcome. God damn, this is an ugly piece of architecture, isn't it?" Avasarala said. "I saw you looking at the pillars."

"I was," Michio said.

Avasarala leaned in close, her eyes bright as a schoolgirl's. "They're fake. The rock? Made it with a centrifuge and colored sand. I knew the builder. He was a fake too. Pretty, though. God save us all from good-looking men."

Michio surprised herself by laughing. The old woman was charming. Michio knew that this show of hospitality was just that. A show. And yet it worked; she felt more at ease. The time was going to come, and soon, when Michio was going to have to come to this woman and ask for amnesty. Ask this Earther to let her and her family go free for Marco's crimes. This moment made it seem like maybe the answer would be yes. Hope was a terrible thing. She didn't want to feel, and yet there it was.

She didn't know she was going to speak until she said it. "I'm sorry." What she meant was *I'm sorry I didn't stop the attack that killed your husband* and *I'm sorry I didn't see Inaros for what he was sooner* and *I*

would do it all differently if I could live my life backward and try again.

Avasarala paused, looked deeply into Michio's eyes, and it was like seeing someone through a mask. The deepness there startled her. When she spoke, it was as if she'd heard every nuance.

"Politics is the art of the possible, Captain Pa. When you play at our level, grudges cost lives."

Across a narrow courtyard, James Holden turned and then came trotting over. He, at least, was the same height she remembered. He looked a little older than when they'd fought against Ashford on the *Behemoth*. Back in the God-who-could-have-known-they-were-the-good-old-days. She saw the surprise and pleasure as he recognized her.

"Captain Holden," she said. "Still weird to see you."

"Right?" he said with a boyish smile that seemed totally unaffected. He turned to Avasarala. "Can I pull you away for a minute? There's a thing."

Avasarala squeezed Michio's arm, then let it go. "Forgive me," she said. "Holden can't find his cock with both hands unless there's someone there to point him at it."

They walked away together, heads bent in conference. Behind a spray of ivy, Michio saw a tall, dark-skinned woman bent a degree forward as she laughed with the Martian prime minister. Naomi Nagata. She looked ... normal? Unremarkable. Michio knew her from before, and still might not have known her if they'd passed in a common corridor or shared a tube ride. But this was the woman Marco had abducted before his attack on Earth, just so he could watch her look upon his power. The woman who'd turned away from him when they'd both been little more than children themselves. Michio would never know how much of the decision to take the last remnant of the Free Navy to Medina had been for cold tactical reasons and how much was because Naomi Nagata had been there. It was so petty and so small, and she had no trouble believing it. *When you play at our level, grudges cost lives.*

Carlos Walker strolled through an archway, caught her eye, and smiled. She'd known him mostly by reputation back when she'd been part of Fred fucking Johnson's OPA. Carlos Walker, with his playboy's manners and the weird religious streak, the sincerity of which no one seemed able to determine. He plucked two fresh flutes of champagne from a passing tray and made his way toward her.

“You look thoughtful, Captain Pa.”

“Do I?” she said, taking the glass. “Well, then I suppose it must be true. And you? How does it feel being the unelected representative of the Belt?”

Walker smiled. “I could ask you the same.”

She laughed. “I’m not representing anyone but myself.”

“Really? Then what are you doing here?”

Michio blinked, but didn’t know how to respond.

A little less than an hour later, a soft chiming and a discrete rush of personal assistants and aides announced the actual meeting. Pa let herself be carried along with a growing sense of displacement. The meeting room was smaller than she’d expected, and arranged in a rough triangle. Avasarala, a thin-faced man in a formal jacket, and two men in military uniforms sat at one corner. The Martian prime minister—Emily Richards—sat at another with half a dozen people in suits fluttering around her like they were moths and she was an open flame. And at the third, Carlos Walker, Naomi Nagata, James Holden, and Michio herself.

A second rank of chairs held dozens of people whose roles Michio didn’t know. Senators. Businessmen. Bankers. Soldiers. It occurred to her that if she’d had a bomb, she could probably have crippled what was left of humanity’s major governments by taking out this one room.

“Well,” Avasarala said, her voice clear as a Klaxon, “I’d like to start by thanking all of you again for being here. I’m not fond of this shit, but the optics are good. And we do have some things to discuss. I have a proposal ...” She paused to tap a command into her hand terminal, and Michio’s chimed in response, as did everyone else’s in the room. “... a proposal about the architecture by which we try to unfuck ourselves. It’s preliminary, but we have to start somewhere.”

Michio opened the document. It was over a thousand pages long, with the first ten a tightly written table of contents with notations and subsections for every chapter. She felt a little wave of vertigo.

“The overview looks like this,” Avasarala said. “We have a list of problems as long as our arms, but Captain Holden here thinks he’s come up with a way to use some of them to solve the others. Captain?”

Holden, beside her, stood up, seemed to realize no one else was going to stand up to talk, and then shrugged and bulled forward with it. “The thing is the Free Navy wasn’t wrong. With all the new systems opened up, the

economic niche that Belters have filled *is* going to go away. There are so many reserves on these planets that don't require we bring our own air or generate our own gravity that the Belt is going to be outcompeted. And, no offense, the plan up to now has been versions of 'sucks to be you.'

"There's a significant population of the Belt that's not going to be able to move down a gravity well. They're just going to be forgotten. Left to die off. And since that's not all that different from how Belters got treated before, it was easy for Inaros to find political backing."

"I wouldn't say that was the only thing that got him there," Prime Minister Richards drawled. "Having a bunch of my ships helped him out."

The room chuckled.

"But the thing is," Holden said, "we've been going out there wrong. There's a traffic problem we didn't know about. Under the wrong conditions, it's not safe to go through the gates. Which we found out because a bunch of ships went missing. And if the plan is that just anyone who wants to go through the gates does so anytime they want to, more will go missing. There has to be someone regulating that. And, thanks to Naomi Nagata, we now know the load limit of the gate network."

He paused and looked around, almost as if he was expecting applause before he went on.

"So that's two problems. No niche for the Belt. The need for traffic control through the gates. Now add to that the fact that Earth, Mars—all of us really—have taken enough damage in the last few years that our infrastructure won't carry us. We have maybe a year or two to really find ways to generate the food and clean water and clean air that we're *all* going to need. And we probably can't do that in our solar system unless just a lot more people die. We need a fast, efficient way to trade with the colony worlds for raw materials. So that's why I'm proposing an independent union with the sole and specific task of coordinating shipments through the gates. Most people who want to live on planets will just do that. But the Belt has a huge population of people who are specifically suited to life outside a gravity well. Moving supplies and people safely between solar systems is a new niche. And it's one we need filled quickly and efficiently. In the proposal, I called it the spacing guild, but I'm not married to that name."

A gray-haired man sitting two rows behind Emily Richards cleared his

throat and spoke. “You’re proposing to turn the entire population of the Belt into a single transport company?”

“Yes, into a network of ships, support stations, and other services necessary to move people and cargo between the gates,” Holden said. “Keep in mind, they’ve got thirteen hundred and seventy-three solar systems to manage. There’s going to be work. Well, thirteen hundred and seventy-two, really. Because of Laconia.”

“And what do you propose to do about Laconia?” a woman behind Avasarala asked.

“I don’t know,” Holden said. “I was just starting with this.”

Avasarala waved him to sit down, and reluctantly he did. Naomi shifted, murmured something in his ear, and Holden nodded.

“The proposed structure of the union,” Avasarala said, “is fairly standard. Limited sovereignty in exchange for regulatory input from the major governing bodies, meaning Emily and whoever they elect once I’m out of this.”

“*Limited* sovereignty?” Carlos Walker said.

“Limited,” Avasarala said. “Don’t ask me to put out on the first date, Walker. I’m not that kind of girl. The union will, of course, need to have support from the Belt. The first union president will be taking on a huge job, but I think we can all agree that we have a unique opportunity for that. Someone well-known both among Belters and on the inner planets.”

Holden nodded. Michio looked over at him. His bright eyes and firm chin.

“Someone,” Avasarala continued, “above—or at least apart from—factions and politics. Trustworthy, well-tested moral compass, and with a long résumé of doing the right thing even when it’s unpopular.”

Holden smiled, nodded to himself. He looked so pleased. Michio hadn’t come to a meeting. This was an anointing. She was suddenly profoundly disheartened. It would probably improve her chances for getting amnesty, but—

“That is why,” Avasarala said, “we need to draft James Holden.”

Holden yelped like he’d been bitten. “What? Wait. No, that’s all wrong. It’s a terrible idea.”

Avasarala frowned. “Then—”

“Look,” Holden said, standing up again. “This is exactly the problem.

This is what we keep doing. Forcing rules and leadership on the Belters rather than letting them pick for themselves.”

A grumble passed through the room, but Holden just kept talking.

“If I can use this moment to nominate someone else instead. Someone with all the qualities Madam Secretary Avasarala just listed, and more. Someone with honor and integrity and leadership, and with the added bonus of actually belonging to the community they’d be leading.”

And somehow—Michio wasn’t sure how this had happened—Holden was pointing at her.

“Then I would nominate Michio Pa.”

Chapter Fifty-Three: Naomi

The Blue Frog was closed for renovations, so after the meetings were over, she drove the cart to a pub two levels higher and a little to spinward. The sign beside the door was cheap steel set into the wall with the words COOPERATIVE FOURTEEN hand-welded into it. Naomi didn't know if the name had a history behind it, or if that was just the new style in naming clubs. On the other side of the door, the decor took on a much less industrial feel. The tables glowed in bright primary colors, and the walls were covered in strands of woven wire, looped and tied to look like old pictures of waterfalls. A low stage with a karaoke setup hummed and danced with itself, waiting for someone to break the ice. There was room for as many as a hundred people in the space, and counting herself and Jim, there were probably fewer than twenty. But it was also off-hours, so that made it hard to judge.

The crew were already there and, to judge from the empty bottles the waiter was clearing away, had been there for some time. As they walked across to them, Jim relaxed. The four of them gave a little cheer and made space for two new chairs at the table.

"What happened?" Bobbie said. "You were supposed to be here hours ago."

"Avasarala jumped me," Jim said, and Amos' empty, amiable smile got a degree wider. Jim laughed and shook his head. "No, I mean she tried to get me named as the head of the spacing guild."

"You know that name's not going to stick, right?" Alex said.

"Wait, she did *what*?" Bobbie said.

Jim held out his hands, a gesture of helplessness. "She gave out the proposal, and I gave my little speech about it, and then boom. Right at the front, she said I should be the one to help put it together. First union

president. It probably took the first two hours just convincing her I wouldn't do it."

"Why didn't you take the position?" Clarissa asked. She seemed genuinely confused.

"Because then I'd have to do it," Jim said, waving to call the waiter back.

"Makes sense she'd want someone she could control calling the shots, though," Alex said.

"Avasarala doesn't think she can control Holden," Bobbie said. "But she also doesn't think anyone else can. She might just want someone from Earth in charge, at least as a figurehead. Makes the union *feel* like it's in her circle of influence. Fred Johnson was OPA to the marrow, but he was from Earth. He never totally got away from that."

The waiter trotted over and took Jim's order. Naomi leaned in around him so she could see Bobbie as she spoke.

"That was our point," she said. "If it's going to work, the Belt needs to know it's their own and not another set of scraps that the inners are tossing out." The waiter reached out, his fingers stopping just short of touching her shoulder. "Whatever your best stout is," she said, and he vanished with a nod. She turned back. "Anyway, we threw Michio Pa under the bus."

"She's perfect," Holden said. "She knows all the players in the Belt. She's not afraid to work with Earth and Mars. She's literally the former commander of Medina Station. Granted back before it was a station, but she's got a real familiarity with the ship. And look what she's been doing since she broke with Inaros. Coordination and distribution. *Exactly* the job we're looking at."

"Well," Alex said, "except with less piracy this time. I mean, assuming."

"Did she take the job?" Bobbie asked.

"She's coming around," Naomi said. "It was a long meeting."

"What about us?" Clarissa asked. Her voice had dread in it. A hollowness. "What do we do now?"

"We join the union," Jim said. "I mean, we'll need to vote on it here in the family, but it seems weird to push for a new architecture for the colonies and then not be part of it. And there'll be a lot of work for a good ship. We have a good ship."

Clarissa's gaze flickered up to Naomi, then, with an almost invisible

smile, away. Jim hadn't understood what she'd really been asking. *Now that the war's over, do I still have a place here?* And he didn't know that he'd answered yes. He had a genius for assuming things that let Clarissa trust him. Naomi handed the girl a napkin so she wouldn't have to dab her eyes with a cuff.

"Seems to me," Alex said, "we should look at escorting colony ships. And making sure the ore or whatever the colony has to trade gets where it's going."

"Lot of trade in-system too," Amos said. "Don't *have* to go out past the gates."

"Yeah," Alex agreed. "But there's more planets out there than I'm going to be able to see in my lifetime. I'd like to get to a few of them."

The waiter returned with Jim's gin and tonic and her own stout. When she tried to pay, the transaction was already zeroed out. The waiter smiled at her, shook his head, and said, "On the house." Naomi nodded her thanks. Jim was already drinking.

Bobbie was the only one who seemed quiet, her hand wrapped around a glass. Alex and Amos told Clarissa stories about New Terra and going through to the new worlds. Jim drank and chimed in on occasion, the political meeting starting to fade and his shoulders slipping a little lower as he relaxed. But Bobbie kept her own council until Naomi finished her second drink, took the Martian's hand, and tugged her away.

"Are you all right?" Naomi asked.

"Yes," Bobbie said in a voice that meant *no*. "It's just ... this is really the end of the terraforming project, isn't it? I mean, I knew that, but ... I don't know. Trying to get us all to here helped distract me. But this agreement they're hammering out. It's the shape things are going to have from now on."

"Yeah," Naomi said. "And it's going to be different."

"All my life, changing Mars. Making it a viable ecosystem ... it's just always been a thing. Hearing about rules and laws and systems for how that's never coming back ... I don't know. It's kind of hitting me that it's really gone."

"Probably, yeah," Naomi said, but Bobbie went on as if she hadn't heard her. As if she was saying something out loud for the first time. Discovering her thoughts by hearing them expressed in her own voice.

“Because Inaros and all the Free Navy people, they weren’t fighting for Belter rights or political recognition. They were fighting to have the past back. To have things be what they’ve always been. Sure, with them on top maybe, but ... Earth’s not going to be humanity’s home anymore. Mars isn’t going to be Mars, not like I knew it. Belters aren’t even going to be Belters now. They’re going to be ... what? Shipping magnates? I don’t even know.”

“No one does,” Naomi said, leading Bobbie forward. The big Martian didn’t seem aware that they were walking. “But we’re going to find out.”

“I don’t know who I am in that world.”

“I don’t either. None of us does. But I know that I have my ship. And my little family with it.”

“Yeah. That sounds like a plan.”

“Good,” Naomi said, and put a microphone in Bobbie’s hand. “Let’s pick a song.”

The pub filled up more at shift change, but for once no one seemed to take much notice of Jim or any of the rest of them. Even when Naomi got a standing ovation for what in retrospect must have been a deeply flawed version of Devi Anderson’s “Apart Together,” nobody seemed to recognize the crew of the *Rocinante* as being anything but the people at table six. It felt good knowing that could still happen sometimes. By the end of the night, even Clarissa had a turn on stage. It turned out she had a good singing voice, and after she got down, a local boy with Loca Griega tattoos tried to hit on her until Bobbie gently made it clear nothing was going to happen.

They took the tube back to the dock, filling up almost half of a car just themselves, still a little tipsy, still talking too loud, laughing at nothing really. Alex’s Mariner Valley drawl got thicker, and Bobbie mimicked it, egging him on until they sounded like parodies of themselves. Jim, least involved with the hilarity and still somehow central to it, sat back against the rattling wall of the car, his hands behind his head and his eyes half-closed. She didn’t really understand what she and Jim and all the others were reacting to until they were at the ship. Seeing the *Rocinante* locked in the docking clamps was like falling into a familiar pair of arms. They were giddy because Jim was giddy. And Jim was giddy because, for once, he’d just avoided being responsible for the future of the whole human race.

It seemed like a fair thing to celebrate.

Back on board, the group moved together to the galley, not ready yet for the day to be over. Clarissa made herself some tea, but there wasn't any more alcohol. Just the six of them, lounging in a galley designed to serve many more. Alex, sitting with his back against one wall, told a story about when he'd been in training on Olympus Mons and the mother of one of the other recruits had arrived to complain that the drill sergeant was being too rough on her son. That led into Bobbie talking about a time when she and her squad had all gotten food poisoning at the same meal, but bullied each other into training the next day regardless, then spent the day puking into their helmets. They were all laughing together, sharing parts of the lives they'd had before they came here. Before the *Rocinante* was their home.

Eventually, without the flow of conversation abating, Alex made enough chicken with peanut sauce for everyone and passed bowls out while Clarissa told a surprisingly funny story about being in a prison writing workshop. Naomi ate the chicken with a fork, leaning against Jim as she did. The sauce wasn't like Belters made it, but it was good enough.

She felt Jim getting near the end of his endurance. He didn't say anything, but she knew from the sound of his breath and the way he unconsciously tapped his leg like a child trying to stay awake. She felt the exhaustion herself. It had been a long day, and the stakes had been high. The pleasant buzz left over from the pub was starting to fade, and deep, muzzy tiredness was slipping into her joints. But she didn't want the moment to end either, any of the moments with these people in this place, even though eventually they had to. No, not *even though. Because.*

Because eventually they had to. Nothing lasted forever. Not peace. Not war. Nothing.

She stood first, taking her bowl and Jim's and Bobbie's, since she was done with it, and feeding them into the recycler. She stretched, yawned, held her hand out to Jim. He took his cue. Alex, who was talking about a music performance he'd seen on Titan back when he'd still been in the service, nodded his good night. Naomi led Jim to the lift, then to their cabin with the occasional sound of laughter filtering through to them, fainter the farther they went, but not absent. Not yet.

Jim fell onto the crash couch like a marionette with his strings cut, threw one arm across his eyes, and groaned. In the light, he looked young again. The stubble on his neck and along the side of one cheek was thin and

patchy, as if it were growing in for the first time. She could remember when the prospect of Jim and his body had been as powerful as a drug to her. Powerful enough that she'd been driven to take the risk of being with him. He hadn't known then how much of a leap it had been for her. He probably still didn't know now. Some things were secret even after you told them. He moaned again, shifted his arm, looked up at her. His smile was equal parts exhaustion and delight. Exhaustion from what they'd been through. Delight because it was done. And because they were both there.

"Do you think Pa will take the job?" he asked. He sounded almost wistful.

"Yes, eventually," Naomi said. And then, a moment later, "How long have you been planning that?"

"The idea of the union, or Pa in particular?"

"Pa."

Jim shrugged. "It was pretty clear early on that having an Earther be the head of it wasn't going to work. I thought Fred would be able to find someone. So I guess I started looking at her for it right around then. Consciously, anyway. She was kind of perfect, though. She broke with the Free Navy in order to help the Belt. No one else did that, or at least not as openly. And she won every fight she led her people into. I think the ones who need to take her seriously, will."

Naomi sat on the edge of the crash couch. It shifted with the change in the center of their combined weight, moving Jim a few centimeters closer to her. He stretched out an arm as invitation, and she settled back into it. "Do you think she'll enjoy it?"

"I don't know. I'd hate it, but maybe she's different enough from me she'll find something to redeem the process. The important thing is I think she'll be good at it. Plays to her strengths. At least I don't know anyone who's likely to do better."

"I hope you're right," she said. "You really think you couldn't have done it?"

"I was never an option. There's too much history. Maybe an Earther can do it in a generation or three when things have been different for a while."

Naomi laughed, moved her head to rest beside his. "By then something else will have happened."

"Yeah," Holden said. "That's true. But in the short term, I really do think

she's the best one for the job. I'm just glad she was here. My second choice for the job would have been you."

She sat up, looking into his eyes to see whether he was joking. A long way away, Amos laughed just loud enough for the echoes to reach her. Jim's expression was somewhere between chagrin and amusement.

God, he'd been serious.

"You could have done it," Holden said. "You're smart. You're a Belter. Your opposition to the Free Navy's as good or better than Pa's. You have a track record that Earth and Mars would have been comfortable with, and enough connection to the Belt to make you plausible to them."

"You know I wouldn't have done it, right?"

"No," Jim said, and there was something almost like sorrow in his voice. "I know you wouldn't have wanted to. I know you would have hated it. But you would have, if you had to. If there wasn't someone else. Too many people would have needed you for you to turn them all away."

She lay back down, considered the idea, and shuddered.

"I know, right?" Jim said. "And how are you doing?"

She took the hand of the arm she was lying across in hers, drew it gently around her like he was a blanket. He had asked her that every few days since the war ended. How was she doing? It sounded like an innocuous question, but it carried more than its own weight. She'd killed her old lover, her old friends. She wished with a longing as powerful as thirst that there had been a way to save her son. Jim wasn't asking if she was all right so much as how bad was it. There was no good answer for that. *I will carry this guilt and sadness for the rest of my life* was just as true as *I lost my son years ago*. Her comfort was that she was still alive. That Jim was. And Amos and Alex. Bobbie and Clarissa.

She was as much a monster as Clarissa or Amos had ever been. She was someone who'd found a way to save her little chosen family when everything seemed lost. The two didn't balance, but they existed together. Pain and relief. Sorrow and contentment. The evil and the redeeming could sit together in her heart, live together, and neither one take the edge off the other.

And Jim knew that. He didn't ask because he needed an answer. He asked because he needed her to know the answer mattered to him. That was all.

“I’m all right,” she said. The way she always did. Jim reached out his other hand and dimmed the lights. Naomi closed her eyes. They felt very comfortable that way. She could hear from Jim’s breath that he wasn’t asleep. That he was thinking about something.

She kept herself awake, just a little. Waited for him. Little flickers of dream danced in at the edge of her mind, and she lost track of her body every now and again.

“Do you think we should go out to the colonies?” he said. “It seems like maybe we ought to. I mean, we’ve been to Ilus. And if we can sort of blaze the trail? Make it normal? Maybe it’ll be easier for Pa to get more Belt ships to take the risk.”

“Maybe,” she said.

“Because the other thing we could do is stay here. There’s just a lot of work that’s going to need to happen here. Rebuilding. Beefing up Medina for when Duarte comes back. Because you know whatever he’s doing is going to be a problem eventually. I don’t know where we should go next.”

Naomi nodded. Jim rolled in closer to her. The warmth of his body and the smell of his skin were consoling.

“Let’s just stay here for a minute,” she said.

Epilogue: Anna

As with astronomy the difficulty of recognizing the motion of the earth lay in abandoning the immediate sensation of the earth's fixity and of the motion of the planets, so in history the difficulty of recognizing the subjection of personality to the laws of space, time, and cause lies in renouncing the direct feeling of the independence of one's own personality. But as in astronomy the new view said: "It is true that we do not feel the movement of the earth, but by admitting its immobility we arrive at absurdity, while by admitting its motion (which we do not feel) we arrive at laws," so also in history the new view says: "It is true that we are not conscious of our dependence, but by admitting our free will we arrive at absurdity, while by admitting our dependence on the external world, on time, and on cause, we arrive at laws."

In the first case it was necessary to renounce the consciousness of an unreal immobility in space and to recognize a motion we did not feel; in the present case it is similarly necessary to renounce a freedom that does not exist, and to recognize a dependence of which we are not conscious.

Anna savored the moment, then closed the text window and made the same, small sound that she always did when she finished the book. Anna loved the Bible and felt comforted and lifted up by what she found in it, but Tolstoy was uncontested for second place.

The accepted etymology of the word *religion* was that it came from *religere*, meaning "to bind together," but Cicero had said its true root was *relegere*, "to reread." The truth was, she liked both answers. What brought people together in a sense of love and community and the impulse to go back to beloved books weren't that different for her. Both of them left her feeling calmer and renewed. Nono said it meant she was an introvert and an extrovert at the same time. Anna couldn't really argue against that.

Officially the ship was the *Abdel Rahman Badawi* operated by

Trachtman Corporation out of Luna, but everyone on board called her the *Abbey*. The complex history of the ship was written in her bones. The hallways were different shapes, depending on the style when they'd been added in or what salvaged ship they'd been taken from. The air always smelled like new plastic from the recyclers. The thrust gravity was kept at a thin tenth of a g to conserve reaction mass. The cargo decks far below Anna now were cathedral-high and piled with all the things that the new colony on Eudoxia—shelters, food recyclers, two small fusion reactors, and a wealth of biological and agricultural materials—would need. There were already two other settlements on Eudoxia. It was one of the most populous of the colony worlds with almost a thousand people on it.

When the *Abbey* arrived, that population would triple, and Anna and Nono and Nami would be part of it. Would live out the rest of their lives, chances were, finding ways to raise food they could eat, learning about their new, broad, and problematic Eden. And hopefully, building the spaces and institutions that would shape humanity's presence on that world forever. The first university, the first hospital, the first cathedral. All the things perched just outside reality, waiting for Anna and her fellow colonists to bring them into being.

It wasn't the retirement Anna had expected or hoped for. Some nights she dreaded it. Not for herself so much as for her daughter. She'd always thought of Nami growing up in Abuja with her cousins, going off to university in Saint Petersburg or Moscow. She felt wistful now, knowing that Nami would likely never have the experience of living in a huge, sprawling urban environment. That she and Nono wouldn't grow old together in the little house near Zuma Rock. That her own ashes, when she passed, would be scattered on unfamiliar water. But Abuja also had a few thousand less mouths to feed. Out of the remaining billions on Earth, it was nothing, except that enough nothings together might add up to something after all.

Her cabin was smaller than the house with two tiny bedrooms, a little sitting area with a scruffy wall screen, and just enough storage for their personal items. There were twenty like it in their hall, with a shared lavatory at one end and a cafeteria at the other. Four halls like hers on the deck. Ten decks on the ship. Right now, Nono was at the galley on deck three singing with a bluegrass quartet. The youngest of the musicians—a

rail-thin, red-haired man named Jacques Harbinger—had used almost his whole personal space allotment on a real hammer dulcimer. Nami would be coming back from school on deck eight, where Kerr Ackerman was using the ship tutorials to teach the two hundred or so children about biology and survival techniques tailored for Eudoxia. After they both came home and they'd all had dinner in their own galley, Anna was going to the Humanist Society meeting on deck two, where she'd already won the role of the loyal opposition to George and Tanja Li, the young atheist couple who ran it. She didn't fool herself into believing anyone would change anyone else's mind. But the trip was long, and a good philosophical discussion passed the hours pleasantly. Then home to work on her sermon for next week.

She remembered something she'd read, she didn't know where, about the life of ancient Greece. The private space had been thin there too, most of people's hours spent in the streets and courtyards of Athens and Corinth and Thebes. A world where everyone's home was not their castle but their dorm room. It was exhausting, but exhilarating too. She could already see the early shapes of the community they would eventually become. And the efforts she made now would have an effect on what happened when they reached their new home planet. The decisions they made in building their township would be the seed crystal for the city that might one day rise up from it. A few hundred years, and the work Anna did now to make this group a kind, thoughtful, centered one might be able to shape a whole world.

And wasn't that worth a little extra effort?

She heard Nami's voice before the door opened, serious and percussive the way she got when she was focused on something. She didn't talk to herself often, so Anna assumed she had someone from school with her. When the door opened, she was proven right.

Nami walked into the little common room, practically dragging a sullen Arab boy behind her. He started a little when he saw Anna. She smiled without showing her teeth, didn't quite make eye contact, didn't move. She'd learned more about how to be with traumatized people in the last year than she'd ever hoped to know, and much of what she came to understand was that humans were domestic animals like dogs and cats. They responded poorly to threats and well to a gentle building of trust. Not rocket science, but easy to forget.

“This is Saladin,” Nami said. “We have a group project.”

“Good to meet you, Saladin,” Anna said. “I’m glad you could be here.”

The boy nodded once, looked away. Anna had to resist the urge to try to draw him out, ask him where he lived, who his parents were, how he liked his classes. She was always impatient to help people, even when they weren’t ready to be helped. Maybe especially then.

Nami, nattering about the great-man theory and technological ratchets and railroading time as if to fill the conversation for both of them, went to her bedroom and came out with her school tablet. Anna hoisted an eyebrow. “That’s been here all day?”

“I forgot it,” Nami said lightly. Then, “Bye, Mom,” as she marched out the door.

Saladin hesitated like he was surprised to have been left alone with a grown-up. Anna looked close to him, but not straight on. He nodded and ducked out the door after her daughter. She waited for one breath, and then another, and then—knowing it was a bad idea—crept to the closed door and peeked out. Nami and Saladin were walking down the narrow ship corridor, squeezing close to be side by side. His right hand was in her left, and as far as Anna could see, Nami was still talking animatedly about whatever she was talking about while Saladin, rapt, listened.

“So what’s your group project?” Anna asked.

Dinner that night was spiced beans and rice that very nearly mimicked the real thing. Nono was tired after her rehearsal, and Anna was expecting the Humanist meeting to be intense and a little taxing, so they’d taken the food back to their rooms instead of staying in the galley. Nami sat cross-legged with her back against the door while Anna and Nono took two of the chairs that folded down out of the wall. The walls were close enough that even though they were on opposite sides of the room, their knees almost touched. It would be almost a year living in the *Abbey*. By the time they reached Eudoxia, they might not remember what open space felt like anymore.

“History,” Nami said.

“Big subject,” Anna said. “Any particular part of history?”

Nono looked up at her from under her eyebrows, so maybe Anna wasn’t being quite as casual and nonchalant as she thought. Nami didn’t seem to notice anything, though.

“No. All of it. We’re not talking about what happened in history, we’re talking about what history is. So, you know”—she gestured in a circle with her spoon—“is the important thing about history the people who actually did things, or if they hadn’t been alive, would the same basic things have happened, just with other people doing them? Like with math.”

“Math?” Anna said.

“Sure,” Nami said. “Two different people came up with calculus right at the same time. So maybe everything’s like that. Maybe it doesn’t matter who leads a war because the things that made the war happen weren’t leaders. They were how much money people had or how good their land was for making food or something. That’s the section I’m writing. Saladin’s writing about the great-man theory, but it’s old because they only talk about men.”

“Ah,” Anna said, cringing at how obvious she felt. “Saladin’s doing that?”

“It’s about the idea that without Caesar, there wouldn’t have been a Roman Empire. Or without a Jesus, there wouldn’t have been Christianity.”

“Hard to argue against that,” Nono said.

“It’s a history class. We’re not talking about the religious part. And then Liliana’s doing the section on the technological ratchet, where the thing that changes is how well we understand how to make things like medicines and nuclear bombs and Epstein drives, and that everything else about history is cyclic. The same things happen over and over again, but it just seems different because we have different tools.” Nami frowned. “I don’t understand that one yet. But it’s not my section.”

“And what do you think?” Anna asked.

Nami shook her head and scooped up a last spoonful of almost-beans. “It’s dumb to break it up like that,” she said around her food. “Like it’s one thing or it’s something else. That’s not how it ever is. It’s always that there’s somebody who does whatever it is. You know, conquers Europe or decides that it’s a great idea to line aqueducts with lead or figures out how to coordinate radio frequencies. You never have one without the other. It’s like

nature versus nurture. When do you ever see one without the other?"

"That's a good point," Anna said. "So how does the project work?"

Nami rolled her eyes. Oh God, they were in eye-rolling ages now. It seemed so recent that her little girl had been free of contempt. "It isn't like that."

"What isn't like what?"

"Mother. Saladin isn't my boyfriend. His parents died in Cairo, and he's here with his aunt and uncle. He really needs friends, and anyway Liliana likes him, so even if I did, I wouldn't. We have to be careful. We're spending our whole lives together, so we need to be really gentle. If we mess it up, it's not like we can just change schools."

"Oh," Anna said. "Is that something you talk about at school?"

The eye-roll again. Two eye-rolls in one night. "That was you, Mom. You're always saying that."

"I guess I am," Anna agreed.

After they were done, Nami took their bowls and spoons and drinking bulbs back to the galley for them, an echo of the way she used to clean up after dinner back at home. When that had been home. Then she was off to study with Liliana and, for all Anna knew, Saladin as well. Nono took her turn being alone in the room. Anna made her way toward the lift and deck two for the Humanist Society, her hands touching the walls at either side of the corridor as if to steady her. *It is necessary to renounce a freedom that does not exist, she thought, and to recognize a dependence of which we are not conscious.* And it was true, as far as it went.

But it was also a mistake to lose sight of all the individual lives and choices and flashes of pure dumb luck that brought humanity as far as they'd come. History, she thought, was perhaps better considered as a great improvisation. A thinking-through of some immense, generations-long thought. Or daydream.

The problem, of course, with the idea of nature versus nurture was that it posed a choice between determinisms. That was something Nami seemed to grasp almost instinctively, but Anna had to remind herself of it. Maybe history was the same way. Theories of how things had to have happened the way they did only because, looking back, they'd happened that way.

Tomás Myers, a short, thick-set man in a formal white shirt, held the lift for her, and she trotted to it so as not to seem ungrateful. It lurched a little as

it rose.

“Going to the Humanist meeting?” he said.

“Once more into the breach.” She smiled back.

As they rose, she felt the first inklings of the week’s sermon starting to fall into place. It revolved, she thought, around Tolstoy’s idea of an invisible dependence and the choice they’d all made to come to the *Abbey*, and Nami saying, *We’re spending our whole lives together, so we need to be really gentle.*

Because that was always true. The *Abbey* and Eudoxia were small enough it became impossible to ignore it, but even among the teeming billions of Earth, they were spending their lives together. They needed to be gentle. And understanding. And careful. It had been true in the depths of history, and at the height of Earth’s power, and it would still be true now that they were scattering to the more than a thousand new suns.

Maybe, if they could find a way to be gentle, the stars would be better off with them.

Acknowledgments

While the creation of any book is less a solitary act than it seems, the past few years have seen a huge increase in the people involved with The Expanse in all its incarnations, including this one. This book would not exist without the hard work and dedication of Danny and Heather Baror, Will Hinton, Tim Holman, Anne Clarke, Ellen Wright, Alex Lencicki, and the whole brilliant crew at Orbit. Special thanks are also due Carrie Vaughn for her services as a beta reader, the gang from Sakeriver: Tom, Sake Mike, Non-Sake Mike, Jim-me, Porter, Scott, Raja, Jeff, Mark, Dan, Joe, and Erik Slaine, who got the ball rolling.

The support team for The Expanse has also grown to include the staff at Alcon Entertainment and Syfy, and the cast and crew of The Expanse. Our thanks and gratitude go especially to Hallie Lambert, Matt Rasmussen, and Kenn Fisher.

Special thanks also go to Leo Tolstoy, translators Louise and Aylmer Maude, and Project Gutenberg for Pastor Anna's comfort reading.

And, as always, none of this would have happened without the support and company of Jayné, Kat, and Scarlet.

**STRANGE
DOGS**

AN **EXPANSE** NOVELLA

Like many before them, Cara and her family ventured through the gates as scientists and researchers, driven to carve out a new life and uncover the endless possibilities of the unexplored alien worlds now within reach.

But soon the soldiers followed and under this new order Cara makes a discovery that will change everything.

Strange Dogs

The day after the stick moons appeared, Cara killed a bird.

That wasn't exactly right. There had been stick moons—which her parents called platforms—as long as Cara could remember. At night, they'd glowed with reflected sunlight like burnt orange bones, and in the daytime, they'd been lines of white bent behind the blue. In her books, the moon was always a pale disk or a cookie with a bite taken out, but that was Earth's moon, Luna. Laconia was different.

So it wasn't that they had *appeared* the night before she killed the bird. It was only that they lit up red and blue and gold for the first time ever. Her parents had gotten up from the dinner table and gone out into the yard, staring up into the sky, and she and her little brother, Xan, had followed. Her father stood there slack-jawed, looking up. Her mother had frowned.

The next afternoon, lying in the blue clover by the pond with sunlight warming her skin and making her sleepy, Cara watched the newly glittering stick moons swim through the sky. They were as bright in the daytime sky as stars were against nighttime black. The colors shifted on them, rippling like videos of sea creatures. As if they were a little bit alive. They drifted east to west, high lacy clouds passing underneath them, and Cara at the bottom of the gravity well, looking up into the vastness like it had all been put there for her to appreciate.

The pond was one of her favorite places to be alone. The curve of the forest ran along one side. Thick trees with three or four trunks that rose up

into a knot before blooming out in green-black fronds longer than her body and so thickly packed that a few steps under them was like walking into a cave. She could find as much shade from Laconia's bright sun as she wanted, whenever she wanted it. The blue clover beside the water was softer than her bed at home and had a smell like bruised rain when she laid on it. The brook that fed the pond and then flowed back away from it again murmured and bubbled in a gentle, random concert with the chirping of the goat-hair frogs. And there were the animals that came there to drink or hunt or lay their eggs. She could lie there for hours, bringing her own lunch and a handheld to read from or draw on or play games on, away from her parents and Xan. Away from the town and the soldiers and Mari Tennanbaum, who was her best friend when they weren't enemies. The township was five thousand people—the biggest city on Laconia—and the pond was Cara's place away from it.

She was halfway through her tenth year, but this was only her third summer. Her mother had explained to her that Laconia moved around its star more slowly than Earth did, and then talked about axial tilt in a way that Cara pretended to understand so they could talk about something else. It didn't matter. Summer was summer and birthdays were birthdays. The two didn't have any more relationship than her nut-bread sandwiches had with her shoes. Not everything had to be connected.

Cara was half asleep when she heard the soft tramp of paws and the creaking of the underbrush. She thought at first it was just in her imagination, but when she tried to change the sound into music the way she sometimes could when she was dreaming, it didn't respond. She opened eyes she hadn't realized were closed. Bright-blue dots like fireflies fluttered and spun in the air as the first of the doglike things came out of the trees.

Its body was long and low, four legs with joints that were put together just a little wrong—like a drawing by someone who'd only ever had legs described to them. Its jaw seemed too small for its face, and its bulbous brown eyes were set at angles that made it seem apologetic. She'd never seen anything like it before, but that happened fairly often.

"Hey," she said, stretching. "What are you?"

The dog paused.

“It’s okay,” she said. “I’m friendly. See?” And she waved.

It was hard to be sure with the thing’s eyes set the way they were, but she thought it was looking at her. She sat up slowly, trying not to startle it. Nothing on Laconia ate people, but sometimes they could get scared, and her mother always told her that frightened things weren’t safe to approach.

The dog looked up, staring at the stick moons for a moment, and then down again at her. She felt a wave of disorientation, like being dizzy but different, and then a twinge of uncertainty. The dog stepped forward, and two more like it came out from the darkness under the trees. Then two more.

On the pond, a sunbird hissed, lifting its leathery wings to make its body look bigger and baring its soft greenish teeth. Its fury-twisted face looked like a cartoon of an old woman, and half a dozen new-hatched babies darted behind her. The first dog turned to look at the momma bird and made three sharp sounds: *ki-ka-ko*. The other four picked up the sound. Momma bird swiveled her head toward each of them, hissing until flecks of saliva foamed at the curves of her mouth. The *ki-ka-ko* cry echoed in a way that didn’t match the space around the pond. It made Cara’s head ache a little. She levered herself up to her knees, partly out of fear that the dogs might eat sunbirds, and she didn’t want to see anything get killed, but mostly because she wanted them to stop making that sound. Her lunch pack and her handheld tumbled to the clover. When she stepped forward, the dogs went quiet and turned their attention toward her, and she had the sense that maybe she was dreaming after all.

She stepped between the dogs and the water’s edge. Momma bird hissed again, but it seemed to Cara like the sound came from a great distance. The dogs drifted closer, moving around her like children around a teacher. She knew in a distant way that she should probably be scared. Even if the dogs didn’t eat people, they could still attack her for getting between them and their prey. She didn’t know why she felt that they wouldn’t.

“You can’t be here right now,” she said.

The lead dog, the one that had come out first, looked past her at the water. Its embarrassed, bulbous eyes shifted back to her.

“Later, maybe,” she said. “You can be here later. Right now you have to go. Go on. Shoo.”

She pointed at the trees and the darkness underneath them. The dogs went perfectly, eerily still for the space of two long breaths together, then turned and shambled back into the forest on their weirdly built legs.

Cara watched them go with a kind of surprise. It was like shouting at a storm to go away and having the rain stop. Probably the dogs had just decided that dealing with her wasn’t worth the trouble. Still, the way it had happened let her feel a little magic. Momma bird was swimming along the side of the pond now, her back to Cara. When the sunbird reached the far edge and turned, she was grunting to herself, the danger of the dogs and the girl equally forgotten. Sunbirds weren’t smart—they weren’t even particularly nice—but Cara still felt good that she’d kept them from getting eaten.

She tried lying back down on the blue clover, but her lazy half sleep was gone now. She tried closing her eyes, then watching the stick moons and their shimmer of colors, but she could feel in her body that it wasn’t coming back. She waited a few minutes to be sure, then sat up with a sigh and gathered up her handheld and her lunch pack. The sun was high overhead, the heat a little bit oppressive now, and it had been a long time since breakfast. She popped open her lunch pack. The sandwich was simple and exactly the way she liked it: two slices of nut bread, each about as thick as her thumb, with a layer of cinnamon and molasses cream cheese between them. Her mother said that honey was better than molasses, but there weren’t any bees on Laconia. Cara had only ever seen pictures of them, and based on those, she didn’t like honey at all.

She took a bite, chewed, swallowed, took another. The baby sunbirds were jumping out of the water, running on the ground, and then plopping back into the pond, sputtering and angry. Momma bird ignored their little sighs of distress, and before long they stopped trying to get her attention and devoted themselves to swimming and searching for food. Earth birds didn’t look much like anything on Laconia, but Cara remembered something about how to treat them. How to share. When Momma bird turned toward her, Cara broke off a tiny bit of nut bread and tossed it out on

the water. Momma bird struck at it like it was a threat and swallowed it greedily. Later on, she'd puke up little bits of it to feed her babies. Cara had watched them at the pond for months. She knew how sunbirds worked maybe better than anyone.

So when Momma bird made a noise—a wheeze with a click in the middle of it—Cara knew it was something new. The babies knew too. They gathered around Momma bird, chittering in agitation and slapping the water with their wings. Momma bird didn't seem to notice them. Her head was wobbling on its long, thin neck. Her unfocused eyes seemed fierce and confused.

Cara put down her sandwich, a knot tightening in her chest. Something was wrong. Momma bird spun around in the water, then turned and spun the other way with so much violence that the nearest of her babies overturned.

"Hey," Cara said. "Don't do that. Don't hurt your little ones."

But unlike the dogs, Momma bird didn't even seem to listen to her. She spread her wings, slapped the water twice, and hauled herself up into the air. Cara had the impression of half-closed eyes and a gaping green-toothed mouth, and then Momma bird sped up into the air, paused, and fell. She didn't try to catch herself when she landed—just crashed into the clover.

"Momma bird?" Cara said, stepping closer. Her heart was tripping over itself. "Momma bird? What's the matter?"

The babies were calling out now, one over the other in a wild frenzy. Momma bird lifted her head, trying to find them from their voices, but too disoriented to do more than wave her head around once, twice, and then set it down. Cara reached out, hesitated, then scooped up the bird's warm, soft body. Momma bird hissed once, halfheartedly, and closed her angry black eyes.

Cara ran.

The pathway leading toward home was barely wider than an animal track, but Cara knew it like the hallway outside her room. It only seemed treacherous because she couldn't wipe her tears back, since she needed both her hands to hold Momma bird. She was still three hundred meters from home when the bird shifted in her hands, arched its back, and made a deep

coughing sound. After that, it was still. The thick sack-and-earth walls of her house came into sight—red and orange, with the rich-green panels of their solar array on top canted toward the sun—and Cara started shouting for her mother. She wanted to believe there was time. That Momma bird wasn't dead.

She wanted to believe. But she also knew better.

Her house stood out just past the edge of the forest. It had the lumpy snakes-lying-on-top-of-each-other walls that all the first-wave colonial structures had. They curved around the central bulb garden, where they grew food. The windows stood open, screens letting in the air and keeping out the insect analogs. Even the little toolshed, where Dad kept the clippers he used to cut the vinegar weed and the cart to carry the stinking foliage away, had windows in it.

Cara's feet slapped down the stone-paved path, her tears making the house, the sky, the trees blurred and unreal. Xan's voice called out from somewhere nearby, and his friend Santiago answered back. She ignored them. The cool, dry air of the house felt like walking into a different world. Rays of light pressed in from the windows, catching motes of dust. For the first time since the pond, Cara's steps faltered. Her legs burned, and the vast, oceanic sadness and horror stopped up her throat so that when her mother stepped into the room—taller than her father, dark-haired, fixing a necklace of resin and glass around her neck like she was getting ready for a party—all Cara could do was hold up the body of Momma bird. She couldn't even ask for help.

Her mother led her to the kitchen and sat there with her and the dead bird's body while Cara coughed out a version of what had happened between sobs. She knew it was muddled—the bird, the dogs, the babies, the bread—but she just had to get it all out of her and hope that her mother could make sense of it. And then make it make sense to her too.

Xan came in, his eyes wide and scared, and touched her back to comfort her. Her mother smiled him away again. Santiago ghosted into the doorway and out again, curious and trying to seem like he wasn't. Tragedy drew attention.

Eventually, Cara's words ran out and she sat there, feeling empty. Deflated. Defeated. Momma bird's corpse on the table didn't seem to care one way or the other. Death had robbed the bird of her opinions.

"Oh, babygirl," Cara's mother said. "I'm sorry."

"It was me, wasn't it?" Cara said. "I killed her, didn't I?"

"You didn't mean to. It was an accident. That's all."

"But it was in the book," Cara said. "Feeding bread to birds. The lady in the park in the book did that. And they didn't die. They were *fine*."

Her mother took her hand. It was strange, but Cara knew if she'd been just a little younger—Xan's age, even—her mother would have hugged her. But she was getting to be a big girl now, and hugs weren't for big girls. Holding hands was.

"These aren't birds, babygirl. We call them that because they're sort of like birds. But real birds have feathers. And beaks—"

"No bird I've ever seen."

Her mother took a deep breath and smiled through her exhalation. "When life comes up on a planet, evolution forces a bunch of choices. What kinds of proteins it's going to use. How it's going to pass information on from one generation to the next. Life on Earth made those decisions a long time ago, and so everything that comes from Earth has some things in common. The kinds of proteins we use. The ways we get chemical energy out of our foods. The ways our genes work. But other planets made other choices. That's why we can't eat the plants that grow on Laconia. We have to grow them special so they'll be part of our tree of life."

"But the old lady fed bread to the birds," Cara said. Her mother wasn't understanding the problem, and she didn't know how to say it any more clearly. In the books, the old lady had fed bread to the birds, and the birds hadn't died. And Momma bird was dead.

"She was on Earth. Or someplace where Earth's tree of life took over. Laconia doesn't eat the same things we do. And the food that Laconia makes, we can't use."

"That's not true," Cara said. "We drink the water."

Her mother nodded. "Water is very, very simple, though. There aren't choices for living systems to make with water because it's more like a

mineral or—”

“Dot!” Her father’s voice was like a bark. “We have to go!”

“I’m in the kitchen,” her mother said. Footsteps. Cara’s father loomed into the doorway, his jaw set, his mouth tight. He’d combed his hair and put on his best shirt. He shifted his gaze from Cara to her mother to Momma bird with an expression that said, *What the hell is this?*

“Cara accidentally poisoned one of the sunbirds,” her mother told him, as though he’d actually asked the question aloud.

“Shit,” her father said, then grimaced at his own language. “I’m sorry to hear that, kid. That’s hard. But, Dot. We have to gather up the kids and get out of here.”

Cara scowled. “Where are you going?”

“The soldiers are hosting a party,” her mother said. “It’s a celebration because the platforms came on.” She didn’t smile.

“We need to be there,” her father said, more to her mother than to Cara. “If they don’t see us, they’ll wonder why we didn’t come.”

Cara’s mother pointed to her necklace. *I’m getting ready.* Her father shifted his weight from one foot to the other, then back. Cara felt the weight of his anxiety like a hand on her shoulder.

“Do I have to go?”

“No, kid,” her father said. “If you want to stay here and hold down the fort, that’s fine. It’s me and your mom.”

“And Xan,” her mother said. “Unless you want to be responsible for keeping him out of trouble.”

Cara knew that was supposed to be a joke, so she chuckled at it. Not that it felt funny. Her mother squeezed her fingers and then let her go. “I am sorry about the sunbird, babygirl.”

“It’s okay,” Cara said.

“We’ll be back before dinner,” her father said, then retreated back into the depths of the house. A few breaths later, Cara heard him yelling at Xan and Santiago. The focus of the family spotlight had moved past her. Momma bird was over. She couldn’t put her thumb on why that bothered her.

The town was half an hour away, down past a dozen other houses like hers. The older houses all came from the first wave—scientists and researchers like her parents who'd come to Laconia just after the gates opened. The town itself, though, came later, with the soldiers. Even Cara could remember when construction waldoes started laying down the foundations of the barracks and the town square, the military housing and the fusion plant. Most of the soldiers still lived in orbit, but every month, the town grew a little—another building, another street. Xan's friend Santiago was seven years old. He was the child of soldiers, and had their boldness. He often came all the way out to her house by himself so he could play. Someday, her father said, the town would grow out around all their houses. The pond and the forest would be taken down, paved over, rebuilt. The way he said it, it didn't sound like a good thing or a bad one. Just a change, like winter moving into spring.

For now, though, her house was her house and the town was the town, and she could sit at her kitchen table while the others got ready to go someplace else. Momma bird didn't move. The more Cara looked at the bird, the less real it seemed. How could something that clearly dead ever have swum or flown or fed its babies? It was like expecting a rock to sing. The babies would be wondering what had happened by now. Calling for their mother. She wondered if they'd know to go back up to the nest with no one there to show them when.

"Mom?" Cara said as her father herded Xan and Santiago back out the door again. "I need to use the sampling drone."

There was a line that appeared between her mother's brows when she got annoyed, even when she was smiling at the same time. "Babygirl, you know I can't go out right now. Your father and I—"

"I can do it. I just need to help take care of Momma bird's babies. Just for a few days, until they're used to her being gone. I messed things up. I need to fix them."

The line erased itself, her mother's gaze softening. For a moment, Cara thought she was going to say yes.

"No, baby. I'm sorry. The sampling drone's delicate. And if something goes wrong, we can't get a new one."

“But—” Cara gestured to Momma bird.

“When I get back, I’ll take it out with you if you still want to,” her mother said, even though that probably wasn’t true. By the time they got back from the town, Xan would be tired and hyperactive and her parents would just be tired. All anyone would want to do was sleep. A few baby sunbirds didn’t really matter much in the big scheme of things.

Santiago’s voice came wafting in from outside with a high near-whining note of young, masculine impatience in it. Her mother shifted her weight toward the doorway.

“Okay, Mom,” Cara said.

“Thank you, babygirl,” her mother said, then walked out. Their voices came, but not distinctly enough for her to make out the words. Xan shouted, Santiago laughed, but from farther away. Another minute, and they were gone. Cara sat alone in the silence of the house.

She walked through the rooms, her hands stuffed deep in her pockets, her scowl so hard it ached a little. She kept trying to find what was wrong. Everything was in place, except that something wasn’t. The walls had the same smudges by the doors where their hands had left marks over the months and years. The white flakes at the corners showed where the laminate that held the house in place was getting old. The house had only been designed to last five years, and they’d been in it for eight so far. Her room, with its raised futon, across the hall from Xan’s, with his. Her window looking out over the dirt road her family had just walked down. The anger sat under her rib cage, just at her belly, and she couldn’t make it go away. It made everything about the house seem crappy and small.

She threw herself onto her futon, staring up at the ceiling and wondering if she was going to cry. But she didn’t. She just lay there for a while, feeling bad. And when that got boring, she rolled over and grabbed her books. They were on a thin foil tablet keyed to her. Her parents had loaded it with poems and games and math practice and stories. If they’d been able to get in touch with the networks back on the far side of the gates, they could have updated it. But with the soldiers, that wasn’t possible. All the content in it was aimed at a girl younger than Xan, but it was what she had, so she loved it. Or usually she did.

She opened the stories, looking through them for one particular image like she was scratching at a wound. It took a few minutes to find it, but she did. A picture book called *Ashby Allen Akerman in Paris*, about a little girl back on Earth. The image was in watercolors, gray and blue with little bits of gold at the streetlights. Ashby and her monkey friend, TanTan, were dancing in a park with the high, twisting, beautiful shape of the Daniau Tower behind them. But the thing Cara was looking for was on the side. An old woman, sitting on a bench, throwing bits of bread at birds that her mother called pigeons. That was where the rage came from. An old woman being kind to a bird and nobody was dying. No one was hurt. And it wasn't even exactly a lie, because apparently she could do that on Earth. In Paris. Where she'd never been and didn't have any reason to think she'd ever go. But if all the things in her books were about other places with other rules, then none of them could ever really be about her. It was like going to school one morning and finding out that math worked differently for you, so even if you got the same answer as everyone else, yours was wrong.

So no, it wasn't a lie. It went deeper than that.

She made herself a bowl of bean-and-onion soup, sitting at the counter by herself as she ate. She'd half expected that, as upset as she was, she wouldn't be able to keep the food down. Instead, eating seemed to steady her. The quiet of the house was almost pleasant. Something about blood sugar, probably. That was what her father would have said. Momma bird's skin had started shining, like it was growing a layer of oil or wax. It could stay there on the counter. She thought about taking it back in case the babies would understand that they shouldn't wait. That they were on their own. She hoped they could get back up to the nest. There were things that would eat baby sunbirds if they couldn't get someplace safe.

"Fuck," Cara said to the empty house, then hesitated, shocked by her own daring. Her mother didn't allow profanity, not even her father's, but they weren't here right now. So like she was running a test to see if the rules were still the rules, she said it again. "Fuck."

Nothing happened, because of course no one was watching her. And since no one was watching...

The sampling drone was in a ceramic case next to her mother's futon. The latches were starting to rust at the edges, but they still worked. Just a little scraping feeling when she pulled them open. The drone itself was a complex of vortex thrusters as wide as her thumb connected by a flexible network of articulated sticks able to reconfigure itself into dozens of different shapes. Two dozen attachable sampling waldos built for everything from cutting stone to drawing blood stood in ranks in the case like soldiers, but Cara only cared about the three grasping ones. And of them, really just the two with pliable silicone grips. She put the waldos in her pocket, hefted the drone on her hip as if she was carrying a baby, and shoved the case closed again before she headed out to the shed.

Momma bird and the drone fit into her father's cart with plenty of room to spare. She thought about it, then grabbed a little hand spade too. She'd use the drone to put the babies safe in their nest, and then give Momma bird a proper burial. It wasn't enough, but she could do it, so she would.

The sun was starting its long slide down into night. The low mist that came from the east smelled as bright as mint, and the shadows of the trees all had a greenish tint against the reddening light. The cart had one wheel that stuck sometimes, skidding along behind her like a stutter until it broke loose again. Cara put her head down, her mouth set, and marched back toward the pond. The tightness between her shoulder blades felt like resolve.

The forest was mostly hers. Xan played there some, but he liked the other kids more than she did, so he spent more time in town. Her mother and father stayed near the house or working on the community greenhouse—which wasn't really a house or green—to keep the food supplies coming. She knew what the sounds of the forest were, even if she couldn't always figure out what made them. She knew the drape of a hook vine from a straight one, the call of a red clicker from a green one. Most of the things that lived there didn't have names. Laconia was a whole world, and humans had only been on it for about eight years. Even if she gave names to everything she saw every day for the whole rest of her life, most of the species there would stay nameless. It didn't bother her. They just were what they were. Common things got names so that she and her schoolmates and

the grown-ups could talk about them. Sunbirds, rope trees, tooth worms, glass snakes, grunchers. Other things, no one talked about, so they didn't need names, and even if she named them, she'd probably just forget.

That wasn't strange, though. All names were like that. A shorthand so people could talk about things. Laconia was only Laconia because they called it that. Before they'd come, it had been nameless. Or if not, the things that had named it were all dead now, so it didn't matter.

She reached the pond, a few bright-gold streaks in the sky where the last of the sun still lit the high clouds. The baby sunbirds were still in the water, peeping in distress at her arrival. The water was dark already, like it had pulled the shadows under the trees into it. The night-feeding animals would come out soon—scratchers and hangman monkeys and glass snakes. She slaved the drone to her handheld. The control panel was more complicated than she was used to, with half a dozen control modes listed down the side that she didn't understand. She was pretty certain she could do everything she needed with only the basic setup. She just needed to get the babies up out of the water and safe into their nest. And maybe take some food up to them. Do the things Momma bird had done. Then she could bury Momma bird, and things would be... not right. But the least wrong she could make them. She took the waldos out of her pocket and compared them to the babies, squinting in the deepening gloom to see which of them looked like they'd be able to hold on to the little bodies but not hurt them.

"I'm sorry," she said to the pale, round-mouthed birds as she fit the smallest waldo onto the drone. "I'm new at this."

One of the babies caught sight of Momma bird's body in the cart and tried to haul itself out of the water to waddle toward her. It was as good a place to start as any. Cara sat cross-legged on the clover and started the drone. It whirred as it rose in the air.

The first baby shrieked, hissed, and ran. Cara smiled and shook her head. "It's okay, little one. It's only me," she cooed. "Everything's going to be all right."

Only it wasn't.

The babies scattered to the edges of the pond and bit at the drone when it came near. When she was able to get a grip on one, it wriggled out a

meter and a half above the ground and fell back into the water. Cara didn't want to hurt them, but the light was fading faster now, and she had to get them up to the nest and then bury Momma and still get back home before her parents and Xan. The time pressure made everything harder. She didn't realize she was clenching her teeth until her jaw already hurt. After nearly an hour she'd only gotten three safely back to the nest. Momma bird lay in the cart, sightless eyes reproachful. Cara's hands ached, and the drone's batteries were half drained.

"Come on," she said as one of the last two babies skittered away from the waldo and ran into the brush at the edge of the pond. "Stop it. Just..."

She reached the soft rubber claw down, and the little sunbird struck at it, biting and tearing with its soft teeth. It wrenched its head around and darted back off across the water, leaving little ripples in the dark water, and then stopping to bob on the surface and chew at its wings as if nothing was wrong. Cara brought the drone in to land beside her while she thought. The last two babies were the biggest. Faster than their siblings, and they weren't getting tired the same way. Maybe they were big enough to avoid predators without her. Maybe they didn't need to be in the nest.

One of the babies swam near her, chirped, and shook its fleshy, pale wings. Without the whirring of the drone to run from, it seemed placid, in a disgruntled kind of way. Its black eyes shifted around at the night, taking in the forest and the pond, the cart and Cara with the same disinterest. It was so close.

Cara shifted forward slowly so as not to startle it. The little sunbird huffed to itself, ducked its head under water, and Cara lunged. Cold water soaked into her sleeves and sprayed her face, but the little ball of squirming flesh was locked in her hands, hissing and biting. She stood up, grinning.

"There you are, little one," she said. "Oh, you're a pain, but I've got you safe now."

Except she wasn't quite sure what made sense to do next. She needed both hands to drive the drone and the waldo, but if she put the sunbird down, it would just run off again. The nest was low enough in the tree, she might be able to climb up one handed and reach it in. She stepped backward, looking through the foliage for a pathway that would work.

The crunch under her heel was confusing for a moment, and then horrifying. She yelped, dropped the baby sunbird, and danced back. The drone glittered on the clover, two of the vortex thrusters caved in by her weight. She dropped to her knees and reached out, fingers trembling in the air, caught between needing to put it all back together and being afraid to touch it. The drone was broken. Her mother's drone that they couldn't replace because it came from Earth and now nothing came from Earth. The sense of having done something terrible that she couldn't take back washed over her—the broken body of Momma bird and the drone building on each other.

It was too much. She'd hide the drone, just for now. The case for it was still back at the house, and her mother might not need it again for weeks. Months. If Cara kept it here, where she could work on it. If she could keep it safe until there was light, then maybe it would be all right. She lifted up the drone, felt the limp ceramic clicking against itself, the sharp edges where before there had been smooth round cylinders, and knew that there were shards of it still in the clover. With the instinct of a thief, she carried it away from the edge of the pond. She shoved it under a little bush and dragged dead tree fronds over it, hardly aware that she was sobbing while she did it. It would be okay. Somehow, it would be okay.

It wouldn't.

When she turned back around, the dogs were there.

She hadn't heard them shamble out of the darkness, and they stood there as still as stones. Their five faces looked like an apology for intruding.

"What?" Cara shouted, waving at them with one sopping arm. "What is it?"

The dog in front—the same lead dog from when they'd been there before—squatted down, its muzzle toward her. Its legs seemed to have too many joints in them, folding together primly. She stepped toward the dogs, wanting to hit them or shout at them or something. Anything that would distract her from her misery. She grabbed the shovel up from the cart, holding it like a weapon, but the dogs didn't react. They only seemed embarrassed for her. She stood for three long, shaking breaths, wet and cold and raw as a fresh-pulled scab, then sat down on the cart next to Momma

bird's body, hung her head, and wept. The corpse shifted when the cart rocked, its skin glistening with whatever that death wax was.

"I didn't mean to break anything," she said. "I didn't want to break anything. It all just... broke, and I, and I, and I..."

The strange noise began again. *Ki-ka-ko, ki-ka-ko*, but instead of being disorienting, it seemed comforting now. Cara pushed the blade of the shovel into the soft dirt beside the cart and rested her arms on her knees. The dogs came closer. She thought for a moment they were going to console her. She didn't understand what they were really doing until one of them reached its wide muzzle into the cart and took Momma bird's body in its mouth.

"No! Hey! You can't have that! That's not food!" She grabbed at Momma bird's stiff, dead feet, but the dog was already trotting away, the others following it into the dark forest and the mist. "Wait!" Cara shouted, but the *ki-ka-ko, ki-ka-ko* sound faded and then, like flipping a toggle, went silent. Cara stood without remembering when she'd gotten to her feet. The sunset was over, full night fallen and stars scattered across the sky above her. The two baby sunbirds grunted in the pond, little noises of animal distress. Her wrists were cold where her sleeves still dripped. She sank to the ground, lying back on the clover, too wrung out to cry. The sounds of the forest seemed to grow slowly louder around her. A soft knocking call off to her left, answered by two more behind her. A hush of wings. The angry harrumph of the sunbirds that she was still going to have to catch somehow, put into their nest somehow. Feed somehow. Everything was terrible, and she couldn't even stop yet. That made everything worse.

High above, the stick moons wavered and shone, lights rippling along their sides while they did whatever the hell it was they did.

Drunk on her own despair, Cara didn't make the connection between the moons and the dogs. Not until much later, when her brother, Xan, was already dead.

Laconia was only one of thirteen hundred and some new worlds. Her parents, like all the others in the first wave, had been intended as a survey

force. Cara's mother had come as a materials engineer, her father as a geologist. She'd come as a baby.

She'd seen pictures on her mother's handheld of herself in the tight-seal diapers, floating in the family cabin of the *Sagan*. The ship was still in orbit—a pale, fast-moving dot when it caught the sun just right—but she didn't remember it at all. Xan had been born a year after they'd all made landfall, and Cara didn't remember that either. Her earliest memory was of sitting in a chair at home, drawing in an art program on her handheld while her mother sang in the next room.

Her second earliest memory was of the soldiers coming.

Her parents didn't talk about that, so Cara had built the story from bits and pieces of overheard conversation. Something had happened on the other side of the gates. The Earth had blown up, maybe. Or Mars had. Maybe Venus, though she didn't think anyone lived there. Whatever happened meant that the scientific expedition that had only been intended to stay for five years was now permanent. The soldiers had come to be the government. They had ships in orbit and the beginnings of cities already being constructed on the planet's surface. They'd made the town. They'd made the rules for how the town worked. They had a plan.

"You've probably noticed," Instructor Hannu, her teacher, said, "that the orbital platforms have been activated."

The schoolroom was the old cafeteria from the first landing. Ten meters by eight, with a vaulted ceiling and reinforcements that let it double as a storm shelter, or would have if there were ever any storms bad enough to shelter from. The inner layer of environmental sealant had started to whiten and flake with age, but the early fears about quarantining themselves from Laconia's ecosphere had gone by the wayside, so no one was in a hurry to repair it. There were no windows, the light entirely from ceramic fixtures set into the walls.

"We've been asked to keep an eye out for anything that changes down here," he went on, "and report it back to the military."

Which, Cara thought, was stupid. Everything changed on Laconia all the time. Telling the soldiers whenever a new plant showed up would be a full-time job. Was a full-time job. Was what all of their parents did, or were

supposed to do, anyway. She wondered if the windowless room was like being on a spaceship. Months or years without ever once going outside or hearing the rain tapping into puddles or being able to get away from Xan and her parents. Never being alone. Never feeling the sunlight on her face. Nothing changing. Nothing new. It sounded awful.

And then circle meeting was over, and the kids scattered around the room to find their tasks for the morning work period. Cara helped Jason Lu with his phonetic-sounds lesson, because she was older and had already mastered it. Then she spent some time on complex multiplication. And then it was recess, and they all piled out to the meadow and the sunlight. Xan and two of the other younger boys ran across the road to skip rocks across the water-treatment reservoir even though they weren't supposed to. Since his best friend, Santiago, went to school in the military's program, Xan had to make do with first-wave children for playmates. So did Cara, but it wasn't as much of a burden for her. She didn't have any friends among the soldiers anyway.

That would change when they set up the lower university and everyone went to the same school, first wave and soldiers both. But that wouldn't be for another two years. There was plenty of time for things to happen between now and then.

Mari Tennenbaum and Teresa Ekandjo came and sat with her, and before long, they'd arranged a zombie-tag game with the other older children. The call for second work period seemed to come too soon, but that was the way time worked. Too fast when you weren't paying attention, and then slow as mud when you watched it. Xan wanted her to teach him phonetic sounds, more because she'd helped Jason with it than because he cared about the lesson, but she did it anyway. When she was done, she did some research of her own.

The classroom had access to the observational data that the survey team had collected since they'd arrived on Laconia. Sunbirds were a common enough species that there might be something there—what they ate, how they matured, when they stopped needing to be cared for—that would help her. Because as soon as school was over, Xan headed out to play with Santiago in the town's center. She was free to get her bicycle, the one her

father had printed for her at the beginning of summer, and start back to the pond and the babies.

The buildings in the town were of two different types. The old ones, the ones like her house, lumpy and round, built from the soil of Laconia and constrained by printed polymer sheaths, marked the original township. The other kind, solidly efficient metal and formed concrete, came later with the soldiers. The roads were new too, and still being built. She and all the other kids loved riding on the smooth, hard surface, feeling the bumps and uncertainty of the land vanish into a steady low hum that traveled up from the wheels through the handlebars and into her bones. They weren't supposed to ride on the roads because the soldiers sometimes had transports and cars come through, but everyone did it anyway.

The sunlight pressed down, warm against her skin. The air had the soft, musty smell it got when rain was coming, the smell her mother called "moldy coffee grounds." A swarm of smoke gnats rose up, swirling into the sky above her in their weird angular patterns, like writing in an alphabet that no one knew. She almost stopped to watch. The road ended at a barracks and construction yard, soldiers in their crisp blue uniforms watching her as she passed. When she waved, one of them waved back. And then she was on the rough trail again and had to keep both hands on the bars.

The effort of riding and the warmth of the afternoon brought her to a kind of trance, comfortable and mindless. In the moment, her body and the world felt like they were all the same thing. As she got near home, she tried to bring her focus back. There hadn't been a lot of study done on sunbird life cycles in particular, but she'd found some notes from one of the early surveys. They said sunbirds ate a lot of things, but they seemed to like the little gray encrustations on water roots the best. She thought that meant Momma bird would have been diving deep into the pond to crack the little gray things free, and then the babies would gobble them as they came up. So she had to find a way to do the same thing. For a few more weeks at least. Until the babies were old enough to leave and make their own nests.

At home, the doors were open, letting the cool air into the house. She pulled the bicycle up beside the door. Her parents' voices came from inside,

raised the way they did when they were having a conversation from different rooms. Her mother's words sounded jagged and stretched, like a wire on the edge of breaking. Cara paused to eavesdrop.

"We're bearing the risks. As long as we're here, anything they do can affect us. They don't know what they could wake up."

"I know," her father said. "Look, I'm not saying you're wrong. But we're not in a position to say what those risks are. And... what are the options?"

She knew the rhythm of her parents, how they talked when they knew she and Xan were listening, and how it changed when they thought they were alone. This was alone-grown-up talk.

"I'm not arguing for that," her mother said, and Cara wondered what "that" was. "But look at Ilus."

"Ilus was uncontrolled, though. Admiral Duarte seems pretty certain they can at least influence how it behaves here."

"How did they even get a live sample?" Her mother's voice had gone peevish and frustrated. "Why would you *want* that?"

"You know this better than I do, honey. The protomolecule was a bridge builder, but it also has an interface aspect. And being able to *talk* to other artifacts is..." His words faded as, somewhere inside, he walked back to her mother.

Cara looked at the shed. She was pretty sure there was a tree-core sampler in there she could use to scrape the roots, but it was heavy. It probably made more sense to just roll her sleeves up and use her fingers. Plus which, she didn't want to tear the roots.

She walked out toward the pond, thinking about her schoolwork. The phonetics lesson. Part of the background had been about how babies learn the phonemes by listening to their parents even before there are any words involved. The way different places use sound—the difference between a particular diphthong on Ceres and the same one in the North American Shared Interest Zone or Korea or on Titan or Medina Station—was something babies mastered even before they knew that they knew it.

She'd read something once about a man back on Earth who'd tried to figure out how to speak with octopi by raising his baby children with

octopi, hoping that the human children would grow up bilingual in octopus and English. It had sounded crazy at the time, but who knew? The way the phoneme thing worked, maybe it made sense after all. Only she was pretty sure no one spoke octopus, so it probably hadn't ended well...

She walked down the path, her steps following the little scrapes that the cart's wheels had made. The pond water was going to be cold. She could already imagine how it was going to feel pushing her arm down into it. She wondered if the babies would still be in the nest. They might be old enough to get themselves down and into the water, and she couldn't decide if that would be a good thing or a bad one.

The smell of coming weather was getting thicker, but the only clouds were light, scudding veils over the sun, not much more than a lighter shade of blue. The breeze was hardly enough to stir the fronds of the trees; they made light tapping sounds when they touched, like dry raindrops. She wondered if anyone had ever studied the little gray things on the water roots to see what they were. Probably they hadn't. Laconia had too many things on it, and there were only so many people there. It would be lifetimes before everything on the planet got discovered and understood. If that ever even happened. She'd had a history-of-science lesson the year before that traced how long it had taken people back on Earth to understand the ecosphere there, and there had been billions of people on Earth for thousands of years. Laconia had a few thousand people for less than a decade.

At the pond, the babies were on the water, splashing pale leathery wings and piping to each other. That was good. They were independent enough to look after themselves that much anyway. With the drone broken, she'd still have to carry them up to the nest. She didn't like thinking about the drone, though.

"Okay, little ones," she said. "Let's see if I can get you some food, okay?"

She knelt at the water's edge, the wet of the mud seeping through the knees of her pants. Deep in the water, she could just make out the pale roots. They looked deeper in than she'd remembered. She was going to wind up soaking her shirt, but she started rolling up her sleeves anyway.

Momma bird hissed.

Cara fell back, scrambling on feet and elbows, as Momma bird swam out of the scrub at the pond's edge. The bird bared her greenish teeth. The tiny wrinkled face deformed in rage as she rushed forward, wings spread. The babies on the pond's surface gathered behind her, clicking in distress. Cara stared, and Momma bird coughed, spat, and turned away. For a moment, Cara tried to make this into some other bird that had happened upon the orphans and taken over the care of them.

But things were wrong. The bird's skin had the same waxy, dead look it had gotten on her counter. The black eyes didn't quite focus the way a normal bird would. There were sunbirds all across the town. Cara had seen dozens, and none of them had the awkward movements this one did. None of them had the weird stillness between its movements or the hesitation like every muscle had to be reminded how to work. Cara pulled herself up the bank, dragging her heels across the blue clover. Momma bird ignored her, paddled to the center of the pond—paused, still as statue—and dove down. The babies circled, excited, until she bobbed back up. All their little mouths struck at the water, spat out whatever they didn't filter out as food, and then struck again.

Cara's throat felt thick. Her breath came in snatches and gasps, like someone had turned off the planet's air supply, and her heart felt like something that had blundered into her rib cage by accident and was frantic for a way back out.

"Really?" she asked.

Nothing answered. She pulled her legs up under her, not realizing until she'd done it that she was taking what her teacher called prayer position. She tried to be still, as if moving might pop the moment like a soap bubble. Momma bird dove again, reemerged. The babies fed, as calm and pleased as if nothing had ever gone wrong. Momma bird went motionless, then moved again.

Cara's shock began to fade, her heart to resume its usual beat, and a slow, wide grin pulled at her lips. She wrapped her arms around herself in a hug and watched silently as the mother who had been dead now protected and fed and stayed with her children again. Some deep, animal relief turned

her bones to water and left her empty of everything but gratitude and wonder.

Something shifted in the darkness under the trees. The dogs stepped into the light, walking toward her with slow, careful steps. The bulbous eyes apologetic.

“Was this you?” Cara breathed. “Did you do this?”

The dogs didn’t answer. They only folded their complex legs and rested for a moment, looking toward Cara. She leaned over, stretched out a hand, and pet the closest one on the top of its head, where the ears would have been if it had been the kind of dog they had on Earth. Its skin was hot to the touch, soft with hard underneath, like velvet laid over steel. It made a gentle humming sound, and then all of them rose up together and turned back toward the trees. Cara stood up and walked after them, not sure what she wanted except that there was a sudden urgency in her heart. They couldn’t leave. Not yet.

“Wait,” she said. And the dogs stopped. They waited. “Can you... can you help me?”

They turned toward her again, their movements eerily synchronized. In the distance, something trilled and buzzed and trilled again.

“You fixed Momma bird,” she said, nodding toward the pond. “Can you fix other things too?”

The dogs didn’t move, but they didn’t turn away either. Cara held up a finger in a don’t-go-away gesture, and moved off to the bushes. The sampling drone was just where she’d left it. Something small had scattered the shattered bits a little, but they were all still there, as far as she could tell. She lifted up the broken machine, its limp, deactivated limbs clacking against each other. The shards she plucked up into her palm.

The dogs watched, motionless. Their constant embarrassed expression now seemed to offer some sympathy, as if feeling her shame at having broken the drone. One of the dogs came forward, and she thought it was the lead from before, though she couldn’t be sure. She knelt and held out the drone. She expected the eerie *ki-ka-ko* noise again, but the dog only opened its mouth a little. What she’d taken for teeth, she saw, were really just little nubs, like the gripping surface on a wheel made for off-road travel. It had

no tongue. There was no throat at the back of its mouth. It made her think of the dinosaur puppet Xan used to love. It leaned forward, taking the drone in its jaws. The little machine hung limp.

A second dog stepped forward, tapping Cara's hand with one wide paw. Cara opened her shard-filled hand. The dog leaned forward, wrapping its mouth around her palm. Something in the touch tingled like a mild electrical shock or the first contact of a caustic chemical. The dog's mouth rippled against her skin, sweeping the shards away. She kept her hand flat until all the bits and pieces were gone and the dog leaned back. Her hand was clean apart from a brief scent of disinfectant, gone almost before she noticed it.

"Thank you," she said as the dog stepped carefully into the darkness under the trees. The one with the drone in its grip turned back to look at her, as if it was embarrassed by her gratitude but felt obligated to acknowledge it. Then they were gone. She listened to the receding footsteps. They went silent more quickly than she'd expected.

She sat quietly, arms wrapped around her legs, and watched the weird miracle of the dead-but-not-dead sunbird until she felt like she'd given the moment all of the honor and respect it deserved.

Like someone rising from a pew, she stood, peace in her heart, and headed back home. As she walked, she imagined telling her parents about the dogs, about Momma bird. But that would mean telling them about the drone too. After it was fixed, she'd tell them. And anyway, it was still too sweet having it just for herself.

"I don't know," her mother said. "I don't feel comfortable with it."

Xan's eyes got large. His mouth gaped like she'd just said the worst, most unexpected thing he'd ever heard. "*Mom!*"

It was Sunday, and the walk into town for church was warm, the air thick and sticky. A soft midnight rain had left the track muddy and slick, so Cara kept to the edge where moss and clover made a kind of carpet. The

tiny green-black leaves made wet sounds under her feet, but didn't soak her shoes.

"You have responsibilities at home," her mother said, and Xan lifted his hands in exasperation and disbelief, like he was a half-sized copy of their father. Cara had seen the same gesture a thousand times.

"I already told Santiago I'd help him," Xan said. "He's *expecting* me."

"Have you finished all your chores?"

"Yes," Xan said. Cara knew it wasn't true. Her mother did too. That was what made the conversation so interesting.

"Fine," she said. "But be home before dark."

Xan nodded. More to himself, Cara thought, than to their mother. A little victory of persistence over truth. After services, Xan could go off and play with his friends instead of being home the way he was supposed to. Probably she should have been angry at how unfair it was that her brother got to bend the rules and she didn't, but she liked it better when the house and the forest were hers. Maybe her parents did too. It wasn't really such a bad outcome if everyone was tacitly happy with it.

Cara's father walked a dozen meters ahead with Jan Poole, the agricultural specialist. Jan's house was on the way to town, and the older man joined them for the walk in to church each week. Or anyway, he did now that they went in for services.

Before the soldiers came, Cara remembered church being a much more optional thing. There had been months when Sunday morning hadn't meant anything more strenuous than sleeping in and making breakfast for all of them to eat in their pajamas. Cara still wasn't sure why the arrival of the soldiers and their ships had changed that. It wasn't as though the soldiers made people come. Most of the men and women who'd come down from the ships to live on the planet didn't come to church, and those that did weren't any different from the science teams. When she'd asked, her mother had made an argument about needing to be part of the community that hadn't made any sense. It all came down to: this was the way they did things now. And so they did them. Cara didn't like it but didn't hate it either, and the walk could be nice enough. She already knew—the same way she knew she'd get her period or that she'd move into her own house—

that someday she'd push back against the weekly routine. But someday wasn't yet.

Services were held in the same space as school, only with the tables taken out and benches made from local wood analogs hauled into rows for people to sit on. Who gave the sermon varied week by week. Most times, it was someone from the original science teams, but a couple of times one of the soldiers' ministers had taken a turn. It didn't really matter to Cara. Apart from the timbre of their voices, the speeches all sounded pretty much the same. Mostly she let her mind wander and watched the backs of the heads of all the people in front of her. The people from town and the soldiers who'd come to the surface all sitting together but apart, like words in a sentence with the spaces between them.

It wasn't the same for the kids. Xan and little Santiago Singh played together all the time. Maggie Crowther was widely rumored to have kissed Muhammed Serengay. It wasn't that the kids didn't recognize the division so much as that it didn't matter to them. The more soldiers came down the well, the more normal it was to have them there. If that worried her parents, it was only because they were used to it being a different way. For Cara and Xan and all the others in their cohort, it had always been like this. It was their normal.

After the sermon, they trickled out into the street. Some families left immediately, but others stood around in little clumps, talking the way the adults did after church.

The results of the new xenobotany run looked promising and The soldiers are breaking ground on a new barracks and Daffyd Keller's house needs repair again, and he's thinking of taking the soldiers up on their offer of new accommodations in town. Speculation on the water-purification project and the weather cycles data and the platforms or stick moons or whatever people wanted to call them. And always the question—sometimes spoken, but often not—*Have you heard anything from Earth?* The answer to that was always no, but people asked anyway. Church was all about rituals. Standing with the sunlight pressing against her face trying not to be impatient was as much a part of the day as the sermon.

After what seemed like hours and hadn't been more than half of one, Xan and Santiago ran off with a pack of the other children. Stephen DeCaamp finished his conversation with her parents and wandered off toward his own home. The church crowd scattered, and Cara got to follow her parents back to their house. The road was flat, but the prospect of going back to the pond, of seeing the dogs again, made it feel like she was walking downhill.

"More," her mother said when they were out of earshot of the others. Her tone of voice told Cara it was part of a conversation that was already in progress. One she hadn't been part of. Her father's sigh confirmed that.

"We knew that would happen," he said. "You can't expect them to live in orbit forever. Being in a gravity well will be good for them."

"Not sure what it will be for us."

Her father shrugged and glanced toward Cara, not to include her but to postpone the conversation until she wasn't around. Her mother smiled thinly, but she let it drop. "Why don't you ever go play with the other children?" she asked instead.

"I do when I want to," Cara said.

"Must be nice," her mother replied with a chuckle, but didn't go farther than that.

As soon as they were home, Cara changed out of her good clothes, grabbed a lunch of toasted grains and dried fruit, and ran out the back. She took a jacket, but not because she'd get cold. She figured that if the dogs brought the drone back, she'd be able to wrap it up and sneak it back into the house that way. Then she could put it in her mother's case later, when no one was watching. A drone had to be easier to fix than a sunbird, after all.

At the pond, Momma bird was sitting at the edge of the water, unmoving and wax-skinned. The tiny, angry black eyes focused on nothing in particular. The babies hissed and spat and chased each other around the pond, diving sometimes, or flapped their pale leathery wings. Cara sat a little way off and ate, watching them. The dogs might not come back today. They might never come back. Maybe they ate drones. Or maybe sunbirds

rose from the dead on their own. That was the thing about Laconia: with so much that no one knew, anything was possible.

After a while, she folded the jacket into a pillow, got out her handheld, and read part of a book about a lost boy looking for his family in the overwhelming press of people in the North American Shared Interest Zone. She tried to imagine what it would be like, walking down a single street with a thousand other people on it. It seemed like it was probably an exaggeration.

The afternoon heat drew a line of sweat down her back. A chittering flock of four-legged insectlike things roiled through the sky like a funnel cloud before diving onto the water, covering the pond in a layer of shining blue-and-green brighter than gemstones for five or six minutes before rising again at the same instant and shooting away into the trees. Cara hadn't seen them before. She wondered if they were a migrant species, or something local that hadn't crossed her path before. Or maybe this was the kind of thing she was supposed to tell Instructor Hannu about.

That seemed weird, though. What was there to say except *I saw something I haven't seen before*? As if that wasn't always true. It would be a strange day when that *didn't* happen.

She did feel a little guilty not saying anything about the dogs, though. Something that took dead animals and made them not-dead would be the sort of thing the soldiers wanted to know about. Would want to capture and study. She wondered if the dogs would want to be captured and studied. She thought not, and they'd already done more for her than the soldiers ever had.

The sun slid westward. The fronds of the trees clattered in the breeze like someone dropping a handful of sticks forever. The anticipation and excitement of the morning mellowed and soured with every hour that the dogs didn't come back. The shadows all lost their edges as thin, high clouds caught the sunlight and softened it. A flash of red and yellow from the stick moons faded and flared and faded again. Artifacts of whatever long-dead species had built the gates.

She watched the lights flutter and stream like a kite caught in some different, gentle wind. Or a bioluminescent creature like they had on Earth.

Something alive, only not alive. Like Momma bird. She wondered if maybe the stick moons were like that too. Something in between. And maybe the dogs...

Something moved in the darkness under the trees, and she sat up. The dogs came out, ambling toward her gracefully on their oddly jointed legs. Cara scrambled to her feet, stepping toward the dogs that weren't dogs. Or if they were, they were what Laconia meant by the word.

The big, apologetic eyes fixed on her, and she grabbed her own hands. She didn't know why, but she felt like she should wave or bow or do something to show them that she was glad they were there.

"Hi," she said. "I didn't think you'd come."

The dogs came around her, making a semicircle with her at the center. The drone hung from the mouth of one at the back, vortex thrusters powered down and clicking against each other like fingernails.

"Were you able...?" Cara said. Then, "Did you fix it?"

The dog with the drone came forward, lifting its head toward her. She took the drone, and the dog let it go. It was her mother's drone, there was no question about that. And the section she'd shattered was intact, but it looked different. The shards and splinters of its carapace were there, but a lattice of silver-white made a tracework where the breaks had been. Like a scar that marked a healed wound. There was no way her mother would fail to notice that. But it wouldn't matter, as long as it worked. She put the drone down on the clover, slaved it to her handheld. The thrusters hummed. The drone rose into the air, solid and balanced as ever. Cara felt the grin in her cheeks.

"This is perfect," she said. "This is everything. Thank you so much."

The dogs looked embarrassed. She powered down the drone and wrapped it carefully in her jacket as they turned and walked back into the dimness under the trees. She wondered where they went when they weren't at the pond. If there was some cave they slept in or a pod where they curled up at night. She had a hard time picturing that. And it wasn't as if they had real mouths to eat with. Maybe they all went to some kind of alien power jack and filled up whatever they used as batteries.

“Thank you,” she shouted again into the shadows. She stood, holding the drone to her chest like it was a baby. “If there’s anything I can do for you...”

She didn’t finish the sentence.

She walked back home quickly, her steps quickened by the prospect of being home, of sneaking the drone into her room unseen. She’d have to be clever to get it back into its case without her parents knowing she’d taken it. There were two ways into the house—the front that faced the road to town, and the back by the garden and the shed. The question was which would be most likely to get her past her family’s watchful eyes and safely into her room. It was getting close to dinnertime, so the front would probably be best, since at least one of them would be in the kitchen. Or she could stow the drone in the shed under the cart and wait until everyone was asleep. That probably made more sense...

She knew something was wrong the moment she stepped in the back door. The air *felt* different, like the moment before a storm. Soft voices she didn’t recognize came from the living room. She walked toward them with a sense of entering a nightmare.

Her father was sitting on a chair; his face had literally turned gray. A uniformed soldier stood beside him, head bowed, and Santiago Singh was behind them, looking away. The boy’s eyes were puffy and red from crying. No one turned to her. It was like she was invisible.

Her mother walked in from the front door, footsteps hard and percussive. Her mouth was tight and her eyes as hard as rage. She gazed toward Cara without seeming to see her.

“Mom?” Cara said, and her voice seemed to come from a long way away. “What’s wrong?”

• • ● • •

It was one of those things. An accident. If any of a thousand details had been just a little different, no one would have even noticed it. The soldier who’d been driving the transport had indulged in a couple beers with his lunch, so his reaction times were just that much delayed. Xan and Santiago

and the other boys had decided to play football instead of tag, so there was a ball that could take a wild kick. Xan had been nearest the road, so he'd been the one to run out to retrieve it. The whole thing was over before anyone understood it had begun. Like that, her little brother was dead, and the drone and Momma bird and the dogs didn't seem important anymore.

Cara sat while the soldier explained it all. Santiago Singh stood at attention, weeping as he retold all he'd seen like the good little soldier he was. Her father lurched out of the room at some point. Her mother dropped her favorite serving bowl, the fragments scattering across the floor. They were like moments out of a dream, connected because they were about the same thing, more or less. But she couldn't have said which happened first. Which one led to the others. Xan was dead, and it shattered time for her. It broke everything.

Admiral Duarte sent his condolences. This was a lapse of discipline that should never have happened. The admiral had already ordered the drunk soldier's execution. Cara's family would be put first on the list for a place in the new housing facilities, and Cara would be guaranteed a place in the academy when it opened. The admiral understood that nothing could compensate for their loss, but the soldiers would do what they could. With the family's permission, the admiral would like to attend the wake. Someone had said, *Of course*, but Cara didn't know if it had been her mother or her father. She might even have said it herself.

The town didn't have a mortuary. In the years they'd been on Laconia, there hadn't been more than a handful of deaths, and none of them had been a child. Not until now. No one seemed to know what to do or how to go about it. Cara had never been to a funeral before. She didn't know what to expect.

They brought Xan home that afternoon, and his body had already been cleaned. Someone had found or made a burial gown for him, white cloth from his throat down to his bare feet. They put him in the front between the door and road on a table. His eyes were closed, his hands folded on his belly. Cara stood at his side, looking down at him and trying to feel. Everything in her seemed to have gone numb.

To her, Xan looked like he was sleeping. Then he looked like he wasn't really Xan, but only a statue of him. A piece of art. Cara found she could flip her brain between seeing him one way and then the other, like he'd become an optical illusion. Her brother, but only asleep. Something not alive, but also not her brother. Back again. Anything except the two together: Never both *Xan* and *dead*.

People from town came. Edmund Otero. Janet Li. The Stover family, with Julianne Stover carrying her new baby on one hip. They brought food. A couple of times, they tried singing hymns, but the songs died out before they could really take root. At one point, Mari Tennanbaum seemed to well up out of the crowd and grab Cara in an awkward hug, like Cara was supposed to be comforting her instead of the other way around. Then Mari faded back into the swirl of bodies and hushed conversation. Cara went back to looking at her brother's corpse.

There was something. Not a bruise really, but where a bruise would have been if Xan's blood hadn't stopped where it was. A discoloration on his head. Cara couldn't get the idea out of her mind that this was where Death had touched him.

She didn't see the soldiers arrive so much as hear it. A change in the voices around her. When she thought to look up, Admiral Duarte was there, silhouetted by the light spilling out of their doorway as he talked to her parents. It was the first time she'd seen him in person and he wasn't as tall as she expected. A centimeter or two shorter than her father. His uniform was perfectly tailored. His pockmarked cheeks made him look older than he probably was.

He was talking to her parents when she saw him, his head bent forward like he was putting all his attention into listening to them. It was a little bit like having a Greek god or a character out of history show up. It wasn't the only unreal thing about the evening, but it was one among others.

Her mother said something she couldn't hear, and the admiral nodded and touched her arm as he replied. He shook her father's hand, neither man smiling. When he walked in her direction, she thought it was to see Xan. To view the body, if that was the phrase. She was surprised when he stopped in front of her.

“Cara?” The way her name sat in his mouth, it was like he was making sure he had the right person and also talking to someone that was his equal. His eyes were soft brown. She could see the sorrow in them. “My name is Winston.”

“I know,” she said like she was accepting an apology. Letting him off the hook.

He shifted to look at Xan. They were silent for a few seconds. He sighed. “I wish I could make this better. I’ve lost people I love before. It was very hard.”

“Why?” she asked, and her voice was sharper than she’d expected. It wasn’t a fair thing to ask. She wasn’t ever sure quite what she meant by it other than who the hell was he to come to her brother’s funeral and talk about his own pain. Winston took the question in, pursing his lips like he was sucking on it. Tasting it.

“Because I hate feeling powerless,” he said. “I hate being reminded that the universe is so much bigger than I am. And that I can’t always protect people.” He shifted to look at her directly again. Like he actually cared about her reaction to this explanation. She understood why the soldiers would follow him. Why they all loved him.

“Would you undo it,” she asked, “if you could? If you could bring him back?”

Maybe he heard something in the question. Maybe it was only that he was listening to her so deeply. He paused, thought. “I believe that I would, yes. I need your family to be well. To be part of what I’m doing here.”

“Taking over Laconia?”

“And everything that comes after that. I want to keep people safe. Not just here but everywhere. The people on Laconia, not just the ones who came with me but all of us, are my best chance to do that. And yes, if I could save your brother, I would. For him, and for your parents, and for you. If I could wave a magic wand and go back in time to keep him off that road? I would do it.”

“You killed the soldier who killed him. Didn’t you need him too?”

“Not as much as I needed you and your family to know that your brother mattered to me. I’m the government here. I imposed that. I didn’t

ask your permission first. That puts some obligations on me. It means I have to show sincerity and respect for our rules, even when that requires doing something I might not want to do. I don't have the right to compromise."

"I think I understand that."

"We have to be one people," he said. He sounded sad. "There's no room for tribes on Laconia. That's how they do it back in Sol system. Earth and Mars and the Belt. That's what we're here to outgrow."

"Everything is different here," Cara said, and the admiral nodded as though she'd understood him perfectly, then touched her shoulder and walked away.

Behind her, someone was weeping softly. She didn't turn to see who. For the first time since she'd come home, she felt almost clearheaded. When she put her hand on Xan's foot the same way she used to when she woke him up, his body was cold.

"It's going to be okay," she said. "I know how to fix this."

Her parents were in the kitchen with Mari Tennenbaum, each of them with a squat glass of wine. Usually her father would be making jokes about it being vintage fifteen minutes ago, but now he didn't seem to notice it was in his hand. The missing joke made her sad, because it meant he was sad.

"What happens to him tonight?" Cara asked.

Mari blinked and reared back a centimeter as if Cara had shouted something rude. Her father didn't react at all, just turned the fixed, polite smile a degree more toward her. Her mother was the one to answer.

"This isn't the time—"

"I know the funeral's tomorrow," Cara said, "but it's not like there's a place in town that he can stay in until then. Can he be here? It's the last night he can, so he should stay here. With us."

Her voice was louder and shriller than she'd intended. Mari Tennenbaum wasn't looking at her, but other people were. Her mother's eyes were as dead as Momma bird's.

"Sure," her mother said. "If it's important to you, he can stay here until the funeral. That would... that would be nice. To have him here."

Then her mother started crying and didn't stop. Her father put down his wine, still with the same smile, and led her away. For a moment, Cara expected Xan to rush in and ask what was wrong with Mom, and then she remembered again. She went back out to stand guard over the body. To make sure that if anyone came and tried to take him away, she'd be there to tell them her mom said not to.

The memorial ended late, people staying until the darkness felt like it had always been there. Like daytime was some other planet. She was still standing beside Xan when Admiral Duarte and the soldiers left, and when Stephen DeCaamp and Janet Li came to move Xan's body inside. Probably nothing in the local system would mistake him for food, but they brought him in anyway, still on the table. They left him between the dining area and the kitchen, dressed in his funeral whites. It was like something out of a dream.

Her parents saw everyone out, said their last farewells, and closed the door. None of them spoke, and Cara went to the washroom and pretended to prepare for bed. Brushed teeth, washed face, changed into a nightgown. She kissed her mother on the cheek and went to her bedroom. She left the door open just a crack, though, so the latch wouldn't make noise when she opened it. Then, as quietly as she could, she took the nightgown back off and pulled on work clothes. She tucked her handheld into her sock drawer. If they checked, it would look like she was in her room. She crawled into bed and pulled the covers up to her neck so if her parents did come in, she'd look normal. The trick, she thought, would be waiting until they went to bed without falling asleep herself.

In the darkness, she bit her lip, chewing the soft flesh so the pain would keep her awake. She counted backward from five hundred, one number with each breath, and then counted back up to five hundred again. She was just shifting the blanket aside to get up when she heard the back door open and her parents' voices drift in. She froze, listened.

The strangest thing was how normal they sounded. How much grief sounded like regular life.

"I'll get that cleaned up later," her father said.

"It's fine. I don't care."

“I know, but I’ll clean it up anyway.”

The ghost of a laugh, gone almost before it started. She could imagine her mother leaning against the counter the way she always did, except that Xan was dead. So maybe they acted different. It seemed like everything ought to have changed.

“I can’t believe this is happening,” her mother said. “It’s just not... plausible?”

“Yeah. I keep feeling like I just had a little seizure or something. Like I was having some kind of hallucination, and now I’m back. Or I’m asleep again. I don’t know. I can’t... I don’t feel like he’s gone.”

Cara felt a little smile tugging at her mouth. For a second, she was tempted to run out and tell them. To have them help. Then they could all do it together.

“I don’t want to be here anymore,” her mother said. “We weren’t supposed to be here anymore. Not us. Not—” Her voice thickened and stopped, like the words had gotten too gooey to get out. Her father was making noises. Like little cooing sounds Cara might have heard from paper bugs. She shifted a little, thinking that maybe she could peek through the crack in her door. See what they were doing. The tightness in her gut was the seconds of nighttime slipping away, and she had to find the dogs.

“He should have been back in Paris,” her mother said. “He should have been with his cousins, not on this fucking nightmare of a planet.”

“I know,” her father said.

“I *hate* it here. I want to go home.”

“I know, Dot. I want to go home too.”

Cara felt the words like a punch. Home? They wanted to go home? They *were* home. *This* was home. What they meant was Earth, where she’d never been, where she didn’t belong. Where Xan didn’t belong.

She must have made a noise, because her mother called out in her tear-thickened voice. “Babygirl?”

Cara froze, then inched back toward her bed. She couldn’t be found now. Not dressed like this.

“Babygirl?” her mother said again, and Cara jumped back into the bed, hauled the blanket up to her neck, and turned her face to the wall. If they

saw her face, they'd know she was only pretending to sleep...

Her door opened. She fought to keep her breath slow and deep. What would she say if they touched her? Should she pretend to wake up? What did she look like when she was just waking up? She didn't know.

"I love you, babygirl," her mother whispered, and the door closed, the latch clicking home. Cara let out a long, stuttering breath. Her pulse was going fast enough for two people, which struck her as funny, because it was sort of true. Her heartbeat and Xan's too. For a while at least.

Her parents' voices were less clear now, but she heard the door to their bedroom close. She waited, counted to five hundred and down again, waited some more. No more noises. No more voices.

The latch was louder than she wanted it to be, no matter how gently she opened it. It felt like it was echoing in the empty house, but she'd spent too much time waiting already. She walked carefully, rolling her weight from carefully placed heel to her toe. Xan lay still on his table. She opened the back door, stepped out to the shed. When she pulled the cart out, she was almost surprised to see that the sampling drone was still in the shed. It seemed like an artifact from some other life, like it had been hidden there for years and not hours. Funny how time worked like that. She ran her fingertips over the repaired shell with its new veins.

Xan's body was heavier than she expected. She'd carried him before sometimes, but he'd always been helping her, at least a little. He wasn't stiff anymore, and she staggered a little getting him through the back doorway. It got easier when she stopped trying to carry him less like a boy and more like a sack of soil. When she dropped him into the cart, his head hit the side with a thump.

"Sorry," she whispered as if he had felt anything. "But really, this is your fault. When this is done, you're going to have to do my chores for me from now on."

Xan's eyes had opened a little. Tiny wet slits hidden behind his eyelashes, catching the starlight. His arms had folded under him when she put him down, twisted and bent at angles that made her own shoulder ache to look at. There wasn't time to make him comfortable, though. She fumbled with the cart's handle and started down the path, then paused and

snuck back into the house. She pulled a bag of fruit and some rice bars out of the pantry, and a bottle of filtered water from the refrigerator. She tucked them beside her brother's corpse, took up the cart handle, and started out.

Night on Earth was bright. That's what they said. Their moon shone like a kind of second, crappy sun. Cities were big enough to drown out the stars with their extra glow. She'd seen pictures of it all, but that wasn't what it had been like for her. On Laconia, day was bright and night was dark. The wide, smeary glow of the galactic disk was the brightest thing in the sky, and she could only navigate by it roughly. Enough to know which direction she was going. Two stick moons floated against the stars, shimmering and shifting, swimming toward each other in the darkness above the sky.

Cara put her head down and pulled. She'd been down this path so many times at so many times of day and in such different weathers that her body knew the way even when she couldn't exactly see it. She knew the sound of the grass and the water, the places where the breeze changed shape, the smell of broken soil and the pattering of bug honey on the lower fronds of the trees. She could have made the trip with her eyes closed, and with the darkness, she very nearly did.

At the pond, a rock deer lifted its head at her approach, its scales shifting and reflecting starlight like a little slice of sky that had come down for a drink. It was too dark to see its eyes.

"Shoo," Cara said, and the animal turned and launched itself into the darkness, tramping through the underbrush and then running away faster than a soldier's truck, even though there were no roads. Cara stopped. A film of sweat covered her forehead, and her armpits felt swampy. She was here, though. She'd made it.

"Hello?" she shouted. "Are you there?"

The darkness didn't answer back. Even the night animals and bugs went quiet, like they were listening with her. Now that she was here, the plan that had seemed so simple was showing its holes. For her to take Xan to the dogs, the dogs had to be there. If they weren't...

"Hello?" Her voice sounded thin, even to her. Stretched and desperate. "Please, are you there?"

She parked the cart in the soft ground at the water's edge and stepped toward the trees. The already black night grew darker. There wasn't even starlight here. Only an absence, like looking straight into the pupil of an eye as big as the world. She put her arms out, fingertips waving for the fronds and scrub that she knew was there but couldn't see. Her eyes ached from trying to see anything. Her ears rang with the silence.

"Please? I need help."

Nothing answered. Despair she hadn't known she was fighting washed into her. If the dogs weren't there, then Xan was gone. And gone forever. And he couldn't be. Grief shifted in her belly, shook her legs and hands. The dogs had been there for Momma bird. They couldn't leave her brother dead, and just save a fucking sunbird.

Her parents would wake up. They'd see the body was gone, and her with it. They'd be angry, and what would she tell them? What would she say to make them understand that the rules they knew weren't her rules, that Xan didn't have to be dead. They'd stop her. She balled her hands into tight, aching fists. She couldn't let them stop her.

"Hey!" she shouted. And then again, loud enough for the air to scrape at her throat. "*Hey! I need you! I need help! It's important!*"

The silence was absolute.

And then it wasn't.

She couldn't tell how far away it was. With nothing to see, sound could deceive her, but somewhere ahead of her, a hiss and crackle of scrub being pushed aside. The rock deer maybe. Or a shambler. Or any of the thousands of uncategorized animals of Laconia that were still waiting to be named.

Or the dogs.

Uncertainty came over her in a wave. It was too big and too strange. Like she'd waved at the sun and it had waved back. Maybe this had been a bad idea, but it was too late now. She steeled herself to face whatever came from the black. The tramping drew nearer, louder. It multiplied and spread. They were coming.

Something touched her hand. A gentle pressure that tingled like a mild electric shock.

Cara dropped to her knees and threw her arms around the dog, hugging the strange, too-solid flesh close to her. It was warm against her cheek, and rough. It smelled like cardamom and soil. It went still, like it wasn't sure what to do with her affection and joy, and it stayed still until she released it.

"Over here," she said, stumbling back to the pond. She gestured in the darkness. And maybe the dogs could see her, because they followed. Starlight glimmered in their bulging eyes.

Xan's funeral whites glowed in the darkness, a paler shadow. The dogs gathered around him, and it was like watching what was left of Xan dissolve. Darkness consuming darkness.

"He's my brother," Cara said. "A truck hit him. It killed him, like with Momma bird. But I need him back. And you brought her back, so you can bring him back too, can't you? I mean you can, can't you?"

She was babbling, and the dogs didn't respond. Mostly blind, she stepped in close, her hands on their backs. The dogs were still and quiet as statues. And then one began making its *ki-ka-ko* call, and the others picked it up until it felt like a choir around her. Until her head spun with it. She sank to her knees to keep from losing her balance. In the sky, the stick moons glittered green and white and blue. The stars looked warmer than their lights.

Xan bobbed up to the surface of the darkness. The dogs were carrying him, one under him bearing his weight on its back. Others holding his arms and legs to steady him as they walked.

"You can, can't you? You can fix him?"

The dogs didn't answer. Xan floated out to the trees, and then behind them. And then there was only the sound of the dogs walking. Then not even that.

Cara sat by the water, hugging her knees. Slowly, the natural sounds of the night came back: the trill of insects, the trill of birds. A high, fluting call from something a long way off, and an answering call from even farther. The stillness cooled her, but not badly. All she had to do now was wait.

Voices woke her. They were calling her name, and she couldn't remember where she was. It wasn't her bed or her room or her house, because there was a dawn-stained sky overhead. Her clothes were wet with dew.

“Cara!”

She was on the edge of calling back, when the last forgetfulness of sleep slid off her mind. She clamped a hand over her mouth as if her arm didn't trust her throat to stay quiet. She scrambled to her feet. Momma bird and the little ones were already on the pond. The dead, black eyes didn't take Cara in. The cart squatted where she'd let it. She snatched the little bag of food out of it, took two steps toward the voices, and then two away. Her mind felt like it was buzzing.

If she told them now, they'd call the soldiers. They'd come and they'd track down the dogs. She didn't think they'd wait for Xan to come back, and he had to come back. But there were only so many paths. They'd find her at the pond, and soon. She'd have to say something, wouldn't she? And what if they didn't let her come back?

She felt like she was still struggling with the dilemma even as she trotted out toward the forest, and the darkness under the fronds. She pushed through the underbrush, twigs and the stick-hard fingers of the scrub sliding off her. A rough break in the plants showed where the animal path led away to the south, and she followed it.

She'd never gone past the pond before. There were probably surveys of the land somewhere. Or maybe not. A decade was a long time to live somewhere, but a planet was larger than the best intentions. She might be going places humans had never been before. Or no one except for Xan, anyway.

The voices grew more distant, but still clear. Her legs ached, but the work of moving fought back the cold. The voices went silent. She thought maybe they'd given up looking for her, but when they started again, there were more. Voices she recognized. Instructor Hannu, Stephen DeCaamp. Mari Tennanbaum.

Her father.

“Babygirl!” he cried. His voice sounded raw. Like he was hurting himself by shouting. “Babygirl, if you're out there, we're right *here*! Baby!”

She wanted to go back to him, to tell him everything was all right. That she was and that Xan was too. Tears rose up in her eyes, blurring the world.

“Sorry,” she said softly, pushing forward. “I’m so sorry.”

She didn’t stop until the sound of the voices was gone. The search would keep going, though. There would be drones. There would be thermal scanning. If the soldiers helped, there would be visuals taken from orbit. She stayed under the canopy of fronds. There were plenty of large animals in the forest. It wouldn’t be easy to tell which heat came from them and which came from her. At least she hoped it wouldn’t.

The sun tracked through the sky, changing the angle of the few, thin dapples that pushed down into the permanent twilight of the forest. Cara felt herself getting tired. She’d have to rest. She’d have to eat. And at some point she’d have to find her way back to the pond. She had to be there when the dogs came back with Xan. After that, everything would be better.

She found a place where a long brown stone pushed up out of the land. It was too round to be a real bench, and whatever the blue moss was growing on, it felt slick and oily. She sat there anyway. The fruit and rice tasted better than it ever had at home, and the water was sweet. She hadn’t realized how dry her throat had become until she drank. Her muscles twitched with fatigue. It wasn’t a bad feeling.

The forest around her was hushed, but not silent. Little things the size of her thumb ticked at her from the trees. They had big wet eyes and tiny mandibles that looked like they were frozen in permanent comic alarm. A bird fluttered by on wide leathery wings, landed on a frond across the way from her, and muttered to itself like a bored child in school. The soft breeze smelled like burnt coffee and fresh grass and rubbing alcohol. An insect buzzed past on bright wings that left a little rainbow afterimage on her eyes.

A sense of peace crept over her, and it felt like the world had sat beside her, opened its own lunch bag, and was just being with her. Everything about the little space was beautiful and calm and rich with a million things that no one had ever seen before. And every place was like this. A whole planet and a solar system beyond it. There would be caves somewhere, with fishlike things living in the waters. There would be ocean coves with tide pools filled with living systems that weren’t animals and weren’t plants.

That didn't have names or an idea of names. She tried to imagine what it would be like going back to Earth, where everything was already known and there weren't any miracles left. It seemed sad.

She pinched the last grain of rice between her fingertips and dropped it on her tongue. She didn't know if the adults were still searching for her. She didn't know how long it would take the dogs to bring back Xan. She'd have to go back home eventually for fresh water and food. But just then, just for that moment, she could let herself feel at peace.

She pushed the empty water bottle back in her pocket, folded the empty bag and shoved it in too. She didn't want to hurry for fear of hearing her name called in a familiar voice. She couldn't stay for fear of missing the dogs. There wasn't a perfect answer, but she didn't need a perfect one. Good enough was good enough.

Making her way home was harder than leaving had been, which made some sense to her. Going away from a point, there were any number of paths, and all of them were right. Going back to the point, most paths were wrong. The rock-deer trail wasn't as clear, now that she was walking back along it. Branches and turns she hadn't noticed on the way out confused her now. And as the sunlight changed its angle and warmth, the colors under the forest canopy changed. Twice, she backtracked to a place she was almost sure was part of the right way and tried again, making other decisions.

The sunlight had started to shift into gray and orange, the air to grow cool, when she came around a stand of trees and the dogs were scattered there, legs tucked primly beneath their bodies. Their embarrassed, apologetic eyes shifted toward her as she came forward. Excitement or fear or both raced through Cara's body like an electrical shock. And then Xan sat up, his head turning toward her.

He was changed, that was obvious. He was still wearing his funeral whites, but a long black stain ran from his left shoulder down to his belly. His skin had a grayness where the red of blood should have been. His eyes had gone pure black. When he moved, it had the same utter stillness broken by considered action as Momma bird, like every muscle that fired had been thought about for a fraction of a second first. But his hair still stood out in

all directions the way it did when he'd just gotten up in the morning. His mouth was the same gentle curve that he'd inherited from their dad.

"Xan?" she whispered.

He was still as stone for a moment, then he shifted his head. "I feel weird," he said, and his voice was his own.

Her grin was so wide it hurt her face. She rushed the last meter between them and hugged him, lifting him up in her arms. For a moment, it was like lifting the dead weight of his corpse. Then his arms were around her too, his head against her neck.

"I was scared," he said. "There was something wrong. And someone was talking to me, only they weren't talking to me."

"There was an accident," Cara said. "You got hurt. Really hurt. *Killed-hurt.*"

A hesitation. "Oh," Xan said. She stepped back, but she kept hold of his hand. She didn't want to let go of him. He blinked. "I feel pretty good for killed."

"I brought you to the dogs. They fix things."

"Like me," Xan said. And then, "There's something wrong with how things look."

"I guess they had to change you some," she said. The nearest dog shifted and looked away, as if chagrined by the limits of their powers. Cara shook her head. "It's okay. This is wonderful. Thank you."

"There are things I didn't see before," Xan said. The words sounded faint. Like he was speaking them from farther off than right here in front of her. "There are other things here. I don't know what they are."

Cara tugged on his hand, pulling him along with her the way she used to sometimes before.

"Come on. It's getting late. We should get home."

"What does it mean to be in a substrate?"

"I don't know," Cara said, tugging him again. "Let's go ask Mom. If I can figure out how to get there from here." She turned to the nearest dog and bowed. She didn't know why that seemed like the thing to do, but it did. "Thank you so much for bringing my brother back to us. If there's anything I can do to help you, just let me know and I'll do it. Really."

The dog made a chirping noise, and then they all rose as one, walking away through the forest on their strangely jointed legs. She half expected them to start their *ki-ka-ko* song, but they didn't. They only faded into the forest again, as if it was the place where they most belonged. Cara started out for what she was pretty sure was the south, and Xan followed along behind, his cool gray hand still in hers.

She didn't find the pond, but a break in the trees opened up on the road to her house. The charcoal sky of twilight glittered with stars and the stick moons. At least now she knew where she was and how to get where she wanted to be. She just hoped no one would see them along the way. She wanted her parents to be the first to see what she'd accomplished.

A soft breeze came from the north and set the fronds of the trees clacking against each other. They walked the same way they came home from school every day, all of it familiar even through the changes. Cara was already imagining a bowl of barley soup and her bed and waking up in the morning to the amazement and wonder of the town. Xan asked how he'd died, and she spent the walk telling the story of his death, his funeral, everyone who'd come, how she'd made sure his body had stayed there for her to steal. He listened more intensely than he ever had before and hardly interrupted at all.

"The head of the soldiers really came to see me?" Xan asked when she was done.

"He did."

"Do you think he'll want to see us again now that I'm back? I don't want to get them in trouble."

Them. He meant the dogs. Cara felt a moment's unease. The soldiers would want to know about the dogs, about Momma bird and the drone and Xan. Especially with the dogs showing up after the stick moons came alive. She'd have to talk to her parents about what to tell the soldiers and how to tell it to them.

She thought of Winston. The way he listened. *I need your family to be well.*

"The admiral understands," she said. "He knows that Laconia's not like other places."

Xan thought about that a beat too long, then nodded more to himself than to her.

The house glowed from every window. Every light in every room had to be burning. It wasn't like her parents to run the power down like that. And they were there too, framed in the window like it was the screen of her handheld. Her mother standing in the kitchen, hands on the counter. Her father sitting at the table. They looked as tired as Cara felt. She wondered if they'd been searching for her all day. If there were still people out there looking.

Xan stopped, staring at the house with his newly black eyes. His face was all stunned amazement, as if he was seeing it all for the first time. In a way, he was. Cara squeezed his fingers gently. He didn't follow her right away when she walked toward the front door. Cara stopped and waved him forward.

"It's going to be okay," she said.

When she opened the door, her mother startled as if Cara had fired a gun, then rushed at her and grabbed her by the arms hard enough to hurt.

"What did you do?" her mother growled through rage-bared teeth. "What the *fuck* did you do?"

And then she pulled Cara close in a hug so tight, it felt like drowning. Her mother's sobs shook them both. Cara put her arms around her mother and found she was crying a little too. Guilt and joy and the echoing sorrow of Xan's death and the triumph of his return all washed together in the moment, and she held on to her mother's body like she hadn't since she was a baby.

"It's okay, Momma," she said through her tears. "It's all okay now."

Her father said her mother's name. *Dot*. One low syllable, but with alarm in it louder than a shout.

Xan stood just outside the open door in the space where he wasn't exactly in the darkness or in the light. His funeral whites carried so much dirt and stain they were like camouflage. His bare feet were filthy. The angle of his eyebrows over his black wet eyes reminded Cara of the dogs—uncertain, embarrassed, apologetic. He stepped through the doorway into the house and went still. Then, in a flicker, lifted his hands toward them all

like a baby reaching for an embrace. His fingernails were dirty. The grayness of his skin made his face seem smudged even where it wasn't.

Cara felt her mother gasp, a sharp, sudden inhalation, and didn't breathe out. Her arms went stiff around Cara, grabbing her in so much it hurt. Xan tried a smile. His gaze clicked from Cara to their father to their mother and back to Cara, as fast as an insect leg twitching. He spread his fingers wider, took another step forward.

"It's okay," Cara said. "I got him back."

Her mother yanked her back, grabbing Cara up and away with a violence that hurt her neck. Cara was back behind the counter, her feet off the floor, her mother's arms pressing the air out of her almost before she realized they were moving. Her father pushed them both behind him. She didn't understand why he had a knife in his hand.

"Gary?" her mother said. "What the fuck is that?"

"I see it," her father said. "It's real."

Cara couldn't speak. She didn't have the air. She wriggled against her mother's grip. She had to explain, to tell them what was going on. This wasn't how it was supposed to happen.

"I want a hug too," Xan said.

Xan took another awkward step forward, still and then the flicker of motion, then still again. Her father yelled, a deep, ragged sound too big for the man she knew. He lunged toward Xan, knife shining in his fist, and terror flooded Cara's blood. She kicked at her mother hard, and felt the blow connect. The grip around her released a little.

"Stop it!" Cara screamed. "What are you doing?"

Xan blocked the knife with his hand, the gray skin opening and black blood pouring from his palm. Xan's eyes went wide with shock. Her father barreled forward, still shouting wordlessly. He grabbed Xan's funeral whites and lifted the little boy off the floor. Cara pushed against her mother's neck hard, and stumbled to the floor. Her mother was keening now, a high, tight sound of panic. Her father had the pantry door open. He threw Xan into it and slammed the door shut, still yelling. There were words in it now. He was shouting, *Leave my family alone.*

“What is the *matter* with you?” Cara shouted. She punched her father’s back and then froze. She’d never hit him before. She’d never hit anyone before. He didn’t even notice. He grabbed one of the kitchen stools and used it to jam the pantry door closed. Xan banged against the door harder than Cara would have thought he could. Her mother yelped and started cursing fast and low, almost under her breath. It sounded like praying.

Tears were streaming down Cara’s cheeks, but she wasn’t sad. All she felt was a powerful, growing outrage.

“I brought him back!” she yelled. “He was dead and I took him to the dogs, and they *fixed* him!”

“Dogs?” her father said. “What dogs?”

“The dogs that came after the stick moons turned on,” Cara said. There was so much they didn’t understand, and the words were like trying to drink through too thin a straw. The meaning wouldn’t all fit. “They fixed Momma bird and the drone and they fixed Xan because I asked them to, and he’s back. I brought him *back* and you *hurt* him!”

She heard her mother somewhere behind her, talking into her handheld. *I need the military liaison. It’s an emergency.* Cara’s outrage and impatience felt like venom in her blood. She pushed at the stool, trying to get the pantry door open again. Her father grabbed her shoulders, pulled her close until his face was the whole world.

“That’s not your brother,” her father said, biting off each word. “That’s. Not. Xan.”

“It is.”

“The dead don’t come back,” her father said.

“They do *here*,” Cara said.

“His eyes,” he said, shaking her as he spoke. “The way he moves. That’s not a human, babygirl. That’s something else wearing my little boy’s skin.”

“So *what*?” Cara said. “He’s knows everything Xan knows. He loves everything Xan loves. That *makes* him Xan. How can you do this to him just because he’s not perfect!”

Her mother’s voice came, hard as stone. “They’re sending a force from town.”

“The soldiers?” Cara said, pulling away from her father’s grip. “You called the *soldiers* on him? You *hate* the soldiers!”

She grabbed at the stool again, but her mother lifted her from behind, hauled her feet off the floor and carried her back toward her room. Xan was calling from the pantry, his voice muted and rough with tears and confusion. Cara tried to twist back toward him. Tried to reach for him.

Her mother pushed her into her room and blocked the door with her body. When she looked down at Cara, her expression was blank and hard. “It’s going to be all right,” her mother said. “But you have to stay here until I get this under control.”

A rush of thoughts fought for Cara’s voice—*It was under control* and *Why are you making this a bad thing?* and *You let Daddy cut Xan*—and left her sputtering and incoherent. The door closed. Cara balled her hands, screamed, and pounded the wall. Her parents’ voices came from the house in clipped, hard syllables that she couldn’t make out. She sat on the edge of her futon, bent double, and put her head in her tingling hands. Her blood felt bright with rage, but she had to think.

The soldiers were coming. Her parents were going to let them take Xan away. *Make* them take Xan away. They’d say the dogs were bad. Dangerous. They might hurt them.

All because it didn’t work like this on *Earth*.

The room was filled with her things. Her clothes—clean and folded in the dresser and worn and scattered on the floor by the hamper. The picture over her bed of dinosaurs running from a man in a big pink hat. The picture she’d made when she was seven from Laconian grass and paste, with Instructor Hannu’s note—*Good work!*—beside it. The tablet with her book on it. She scooped it up, turned it on. It was still open to the page of *Ashby Allen Akerman in Paris*. The old woman feeding bread to the birds. She put her fingertips on the picture. It wasn’t a real woman. It wasn’t even a real painting. It was just the idea of an idea. It didn’t have anything to do with her life, and she didn’t lose anything by letting it go.

She closed the book and opened the recording function. She felt the time slipping past, but she took a long look around the room all the same.

Her whole life was here, written in little notes and objects that added up to a story that only she would understand.

Or else no one would.

The window was easy to open, but the screen was harder to rip than she'd expected. Once she'd gotten a hole big enough for a couple of fingers, it got easier to pull it apart, but it still hurt her fingertips. A little puff of dust came off the fibers when she ripped the hole big enough that she could squeeze through it. The empty water bottle slipped out of her pocket as she climbed out, clattering onto the paving outside her window. She didn't go back for it. She ran across the road to where the underbrush started getting thick. High clouds interrupted the stars in streaks, as if giant claws had ripped strips out of the sky.

The light in the house and the darkness of the world let her see her mother and father in the main room perfectly. Her father had a length of metal as long as his arm held in both hands like a club. He was crying, but he didn't wipe the tears away. He wouldn't put the weapon down long enough for that. Her mother stood at the door, ready to usher the soldiers in when they came. It would be soon. Town wasn't far away when you had military-transport vehicles.

Cara started the tablet recording. She took a deep, slow breath, waited fifteen seconds, and screamed.

"Mamma!"

Her mother's head came up sharply as she looked out into the darkness of the night. Cara tapped the playback and loop, threw the volume to max, and then flung the tablet as hard as she could into the brush. Her mother came out the front door, scanning but blind from the light. From the brush, Cara's voice came again. *Momma!*

"Cara?" her mother said. "Where are you?"

Her father came to the door. She heard him say, "What is it?"

Cara started running. She heard her own voice again, behind her, and her mother screaming for her. And her father now too. She didn't have much time. She looped around the back of the house and in the back door, opening it carefully to keep from making noise. Both her parents had gone out the front to find her. To save her. Their voices reminded her of the

search party that she'd avoided. All the ways they wanted to help her, but never asked how she wanted to be helped.

She kicked the stool away and hauled open the pantry door. Xan was kneeling in the darkness, his legs folded under him just like the dogs. Wet tracks of tears marked his cheeks. His black eyes took her in. She held out her hand.

"Come on," she said. "We have to warn the dogs."

The front door stood open. Across the road, the brush crackled and hushed as her parents crashed through it, calling her name. They sounded frightened. Cara felt sorry for them, but they'd made their choices. She'd made hers. Xan took her hand with his uninjured one, and she hauled him up.

Then they were running out the back, into the night, toward the dogs, wherever they were. Xan matched her stride for stride, never letting go of her hand. Her parents' voices faded behind her. She didn't know if they'd found her tablet or if she'd just gotten far enough away that the sound wouldn't reach her.

It didn't matter.

Xan laughed, and the sound was just like the joy he'd had playing a game with his friends. She felt herself smiling. The feeling of freedom lifted her up. Even with the knowledge of the soldiers following behind her. Even with the grief just starting in her heart that she'd never go home. The night was hers, and Laconia was hers, and that was joyous.

Her legs burned and she felt light-headed from hunger. She hadn't had anything to eat since the fruit and rice in the forest. And there wouldn't be anything for her out in the world. All the plants that Laconia grew were indigestible for her at best. Poison at worst. The sunbirds, the blue clover, the grunchers, the glass snakes, everything alive knew, at a chemical level, that she wasn't one of them. But that didn't matter either.

The worst that could happen was she'd die.

The dogs would fix her.

James S.A. Corey is the pen name of fantasy author Daniel Abraham and Ty Franck, George R.R. Martin's assistants. They both live in Albuquerque, New Mexico. The first and last name are taken from Abraham's and Franck's middle names, respectively, and S.A. are the initials of Abraham's daughter.

Under that name they wrote *The Expanse*, a series of science fiction novels, novellas, and stories, that has also been adapted for television under the same name.

OceanofPDF.com

The background of the cover is a detailed, painterly illustration of a futuristic, industrial space station or orbital city. The structure is composed of various metallic platforms, scaffolding, and large cylindrical components, all set against a backdrop of a fiery orange and red sky. The overall aesthetic is one of high-tech, gritty sci-fi.

Prologue: Cortázar

Almost three decades had passed since Paolo Cortázar and the breakaway fleet had passed through Laconia gate. Time enough to build a little civilization, a city, a culture. Time enough for him to confirm that alien engineers had designed the protomolecule as a bridge builder. They had thrown it into the stars like seeds to hijack whatever organic life it encountered and create ring gates into a pocket universe, a nexus between worlds. Until they died out, the slow zone and its rings had been the hub of an empire that defied human comprehension. And now, it would be again. A little bridge-building mechanism that overcame locality changed everything for all humanity.

Not that Paolo cared about all humanity. For him, the fact of the protomolecule and the technologies it opened was all-encompassing. It not only changed the shape of the universe around him but also altered his personal and professional life. For decades, it had been his only obsession. In the fight that ended their relationship, his most recent boyfriend had accused him of actually *loving* the protomolecule.

Paolo hadn't been able to deny it. It had been so long since Paolo felt anything approaching love for another human that he'd lost the context for what did and didn't qualify. Certainly, studying the protomolecule and all the myriad branches of scientific insight that came from it took most of his time and attention. Understanding the ways in which it interacted with the other alien artifacts and technologies would be the work of lifetimes. He made no apology for his devotion. The tiny, beautiful speck so rich with implicit information was like a rosebud that never stopped blooming. It was beautiful in a way that nothing else could ever be. His lover had been unable to accept this, and the end of their relationship felt inevitable in retrospect. Paolo did miss him, in an abstract sort of way. Like he might miss a lost pair of comfortable shoes.

There were so many other wonderful things to occupy his time.

On the viewscreen in front of him, a latticework of carbon grew and unfolded in intricate, interwoven patterns. Given the correct environmental conditions and the right growth medium, the protomolecule defaulted to building these lattices. The material created was lighter than an equal volume of carbon fiber and had greater tensile strength than graphene. The Technology Directorate of the Laconian Military Council had asked him to explore its possible use in armor for infantry units. The lattice's tendency to permanently bond to human skin made that problematic from an engineering standpoint, but it was still beautiful.

Paolo adjusted the sensitivity of the electron stream and leaned in toward the monitor, watching as the protomolecule picked up the free-floating carbon atoms and neatly wove them into the grid like it was a child focused on its play.

"Doctor Cortázar," a voice said.

Paolo answered with a grunt and a wave of his hand that meant *Go away, I'm busy* in any language.

"Doctor Cortázar," the voice repeated, insistent.

Paolo pulled his gaze away from the screen and turned around. A pale-skinned person of indefinite gender stood in a lab coat, holding a large hand terminal. Paolo thought their name was Caton? Canton? Cantor? Something like that. One of the lab's army of technicians. Competent, as far as Paolo could recall. But now interrupting him, so there would have to be consequences. The nervous look on Caton/Cantor/Canton's face told him they were very aware of this fact.

Before Paolo could speak, the tech said, "The director asked me to remind you that you have an appointment. With"—the tech's voice went low, almost to a whisper—"him. With Him."

The tech did not mean the director. There was only one Him.

Paolo turned off the video display and checked to make sure the monitoring systems were recording everything before he stood up.

"Yes, of course," he said. And then, because he was making an effort these days, "Thank you. Cantor?"

"Caton," the tech replied with visible relief.

"Of course. Please let the director know I'm on my way."

"I'm supposed to accompany you, Doctor," Caton said, tapping on the hand terminal as though this fact was on a list somewhere.

"Of course." Paolo pulled his coat off a rack by the door and headed out.

The bioengineering and nanoinformatics lab of the University of Laconia was the largest research lab on the planet. Possibly in the entirety of human space. The university campus spread across nearly forty hectares of land on the outskirts of the Laconian capital city. His labs accounted for almost a quarter of that space. Like everything on Laconia, it was orders of magnitude larger than it needed to be for the people who inhabited it now. It had been built for the future. For all those who would come after.

Paolo walked briskly along a gravel path, checking the monitor on his forearm as he went. Caton jogged along behind.

“Doctor,” the lab tech said, pointing in the opposite direction, “I brought a cart for you. It’s in Parking C.”

“Bring it around to the Pen. I have something to do there first.”

Caton hesitated for a moment, caught between a direct order from him and the responsibility of being his chaperone.

“Yes, Doctor,” Caton said, then ran off in the other direction.

As he walked, Paolo scanned through his task list for the day to be sure he wasn’t forgetting anything else, then plucked his sleeve down over the monitor and looked up at the sky. It was a lovely day. Laconia had a bright cerulean-blue sky, with a few cottony white clouds scattered about. The massive rigging of the planet’s orbital construction platform was very faintly visible, all long arms and empty spaces between, like a massive oligonucleotide floating in space.

The gentle wind carried the faint burned plastic scent of a local fungus analog releasing what passed for spores. The breeze pushed the long fronds of dogwhistles across his path. The grunchers—approximately the same ecological niche as crickets with even a few morphological similarities—that clung to the plants hissed at him when he got too close. He had no idea why the weeds had been named dogwhistles. They looked more like pussy willows to him. And naming an insect analog that looked like a cricket with four limbs a gruncher made even less sense. There didn’t seem to be any scientific process to the naming of the local flora and fauna. People just threw names at things until a consensus arose. It annoyed him.

The Pen was different from the other lab buildings. He’d had its walls built from single sheets of high-impact armor plating welded airtight into ninety-degree angles to make a dark metallic cube twenty-five meters on a side. At the building’s only entrance, four soldiers wearing light armor and carrying assault rifles stood at alert.

“Doctor Cortázar,” one of the four said, holding out a hand in the universal gesture for *Stop walking*.

Paolo pulled his ID badge on its lanyard out from under his shirt and presented it to the guard, who plugged it into a reader. He then touched the reader to the skin on Paolo’s wrist.

“Nice day,” the guard said pleasantly, smiling as the machine did its work of comparing Paolo’s ID to his physical measurements and his identifying proteins.

“Lovely,” Paolo agreed.

The machine pinged its acceptance that he was actually Paolo Cortázar, the president of Laconia University and head of its exobiological studies lab. The guards had all known that by sight, but the ritual was important for more reasons than one. The door slid open, and the four guards stepped aside.

“Have a nice day, Doctor.”

“You as well,” Paolo said as he stepped into the security airlock. One wall hissed as hidden nozzles blasted him with air. Sensors on the opposite wall tested for explosives and infectious materials. And possibly even bad intentions.

After a moment, the hissing stopped, and the inner airlock door slid open. Only then did Paolo hear the moaning.

The Pen, as it was called by everyone in spite of not having an official name in any documentation, was the second highest security building on Laconia for a reason. It was where Paolo kept his milking herd.

That name had come from an early fight with his ex-lover. He’d meant it as an insult, but it was an apt analogy. Inside the Pen, people and animals that had been deliberately infected with the protomolecule lived out the remainder of their lives. Once the alien nanotech had appropriated their cells and begun reproducing, Paolo’s staff could drain the bodies of their fluids and filter out the critical particles from the matrix tissue. When the bodies were exhausted, any remaining fluids could be incinerated without losing anything of value. There were bays for twenty-four, but only seventeen were occupied at the moment. Someday, with a wider population base, subjects would be more abundant.

The great works of Laconia depended on communicating with the underlying technology the long-dead alien civilization had left behind. The protomolecule hadn’t been designed as a universal control interface, but

there was a modularity to the alien technology that let it function that way often enough for the work to proceed. It was Paolo's job to supply the active samples needed. One of his jobs.

As he walked toward his office in the rear of the building, he paused on a catwalk over one of the holding pens. Half a dozen people in early stages of infection wandered around the cramped, metal-walled space. They were still in the pseudo-hemorrhagic fever phase the techs called Pukers. They could manage no more than a shambling walk and occasional violent bouts of vomiting. It was the protomolecule's means of ensuring the infection would spread quickly. Once the bodies had been removed from the space, every centimeter of its metal walls and floor would be torched to destroy any biological debris.

They'd only had one accidental infection in the history of the lab, and Paolo intended to keep it that way.

Dr. Ochida, head of the Pen and Paolo's second in command, spotted him from across the holding area and rushed over.

"Paolo," Ochida said, clapping him on one shoulder in a friendly greeting. "Just in time. We finished pulling the stem cultures an hour ago, and the injections are prepped."

"I recognize that one," Paolo said, pointing at a hairy, muscular man in the Pen.

"Hm? Oh. Yes, he was one of our guards, I think. His intake paperwork said 'dereliction of duty.' Caught sleeping on watch, maybe?"

"You tested them?" Paolo asked. He didn't actually care about the hairy man in the pen, and Ochida's answer had satisfied his curiosity.

It took Ochida a moment to realize they'd changed back to the original subject. "Oh, yes. I tested the samples for purity three times. Personally."

"I'm going directly from here to the State Building," Paolo said, turning to look Ochida in the eye.

His assistant knew what he was asking and replied, "I understand. These injections exactly meet your specifications."

If anything went wrong, they both knew they'd be the next two placed in the Pen. They were valuable, but they weren't beyond consequences. No one was. That was what Laconia meant.

"Excellent," Paolo said, giving Ochida a friendly smile he didn't actually feel. "I'll take them now."

Ochida waved at someone in a corner of the room, and a tech trotted

over carrying a silvery metal briefcase. She handed the case to Paolo, then left.

“Is there anything else?” Ochida asked.

“I’m starting to see some growth,” Paolo said, pointing at a bone spur protruding from the hairy man’s spine.

“Yes,” Ochida agreed. “They’re nearly ready.”

In the time he’d worked with Winston Duarte, Paolo had found much to admire in the man. The high consul was intelligent, given to astounding leaps of comprehension on complex topics but still measured and thoughtful in his decision making. Duarte valued the counsel of others but was decisive and firm once the information was gathered. He could be charismatic and warm without ever seeming false or insincere.

But more than anything else, Paolo respected his total lack of pretension. Many lesser people, holding a position like absolute military dictator of an entire planet, would wrap themselves in pomp and glittering palaces. Duarte had instead built the State Building of Laconia. A massive construction of stone that towered over the rest of the capital city, it still somehow managed to feel comforting rather than intimidating. As though all its solidity and size was merely to house important works and solve serious problems. Not aggrandize those inside it.

Caton drove Paolo’s little cart up the wide street that led to the building’s front entrance. They were the only traffic. The street ended at a high stone wall, a narrow gate, and a guard post. Paolo climbed out of the cart, taking the metal briefcase with him.

“No need to wait for me,” Paolo said to Caton.

The tech hadn’t spoken since picking him up outside the Pen, and seemed relieved to be dismissed. “Yes, Doctor. Call if you—” But Paolo was already walking away. He heard the car’s electric whine as it left.

The narrow gate opened as he approached, and two soldiers left the guard post and fell in alongside him without a word. These were not like the lightly armored guards that stood watch at the university. These wore strength-augmenting suits of articulated composite plates, with a variety of weapons mounted on them. The suits were the same dark blue as the

Laconian flag and had the same pair of stylized wings. A phoenix, he thought, but it might have been some sort of raptor. The pleasant color made the lethal war machines under it seem out of place. Their footsteps on the stone courtyard and the faint thrum of the power suits were the only noises that followed them to the State Building's entrance.

At the door, his two guards stopped him, then spread out, one on each side. Paolo fancied he could feel the tickle of X-rays and millimeter waves bouncing off his body as they scanned him head to toe. After a long moment one of them said, "The high consul is waiting for you in the medical wing," and then they turned and walked away.

"Technically, yes. The dreams have stopped," Duarte said as Paolo slid a hypodermic port line into a forearm vein and taped it down. He knew from experience that Duarte was distracting himself to keep from looking down and seeing the needles go in. It was endearing that the most powerful human in the universe was still a bit squeamish about needles.

"Have they?" Paolo asked. It wasn't a casual question. The side effects of the incredibly experimental treatment Duarte was receiving were something to be kept close track of. "How long ago?"

Duarte sighed, and closed his eyes. Either relaxing as the first of the sedative mixture hit his veins, or trying to remember the exact date, or both. "The last one was eleven days ago."

"You're sure?"

"Yes," Duarte said with a smile and without opening his eyes, "I'm sure. Eleven days ago was the last time I slept."

Paolo nearly dropped the IV line he was connecting to the port. "You haven't slept in *eleven days*?"

Duarte's eyes finally opened. "I don't feel tired at all. Quite the opposite. Every day I feel more energetic and healthy than the last. A side effect of the treatment, I'm sure."

Paolo nodded at this, though it wasn't anything he'd anticipated. His stomach gave a tiny spasm of worry. If there was an unexpected side effect this extreme, then what else was waiting for them? He'd asked Duarte to wait until they had more data, but the man had demanded they move

forward, and how could he argue?

“I see that look, old friend,” Duarte said, his smile even wider. “You don’t need to worry. I’ve been monitoring it myself. If anything were out of balance, I’d have called you a week ago. But I feel fantastic, I’m not building up fatigue poisons, and the blood work promised I’m not psychotic. And now I get an extra eight hours every day to work. I couldn’t be happier.”

“Of course,” Paolo replied. He finished hooking the IV bag filled with its payload of protomolecule-modified human stem cells into the port. Duarte gave a tiny gasp when the cool fluid started to enter his vein. “But please, do remember to send along these sorts of details, even if they don’t seem to be a problem. Animal models are never perfect, and you’re the first person to receive this treatment. Tracking the effects is incredibly important to—”

“I will,” Duarte replied. “I have full confidence that your lab has everything working exactly as it’s supposed to. But I’ll make sure my personal doctor sends you all his daily notes.”

“Thank you, High Consul,” Paolo said. “I’m going to draw some blood as well and have my people do a workup. Just to make sure.”

“Whatever you need,” Duarte said. “But as long as we’re alone, please don’t call me ‘High Consul.’ Winston’s fine.” Duarte’s voice had grown mushy, and Paolo could tell the sedatives were taking effect. “I want us all working together.”

“We are working together. But a body needs a brain. Leadership, yes?” Paolo replied. He let the IV bag empty, used the line to draw a small sample of Duarte’s blood and put it in the metal briefcase, and quietly went about the process of doing a full body scan. The treatment had begun growing a small number of new organs in Duarte’s body that had been designed by the best experimental physiologists on the planet and implemented using lessons taught by the eternal protomolecule bloom. But there were still so many things that might go wrong, and tracking the development of the changes in Duarte was the most important aspect of Paolo’s job. Despite Duarte’s warmth and the genuine friendship he showed, if anything happened to the Laconian ruler, he would be executed shortly thereafter. Tying Paolo’s safety to his own was how Duarte could guarantee the scientist’s best efforts on his behalf. They both understood this, and there was no ill will attached. Paolo’s death wouldn’t be punishment, exactly. Just

a clear disincentive to letting his patient die.

As relationships went, it was probably the most honest one Paolo had ever had.

“You know, Winston, that this is going to be a very long process. There may be imbalances small enough that they don’t appear for years. Decades.”

“Centuries,” he said, nodding. “It’s imperfect, I know. But we do what we have to do. And, no, old friend. I’m sorry, but I haven’t reconsidered.”

Paolo wondered if the ability to read minds was yet another unexpected side effect of the treatment. If so ... well, that would be interesting. “I wasn’t suggesting that—”

“That you should undergo the treatment too?” Duarte said. “Of course you were. And you *should* suggest it. Make the best argument you can. I don’t believe you’ll change my mind, but I’d like it very much if you did.”

Paolo looked at his hands, avoiding Duarte’s eyes. Defiance would have been easier for him. The melancholy in the man’s voice was disturbing in a way he found hard to understand.

“The ironic thing?” Duarte said. “I’ve always rejected the great-man idea. The belief that human history was formed by singular individuals instead of broad social forces? Romantic, but ...” He waved a hand vaguely, like he was stirring fog. “Demographic trends. Economic cycles. Technological progress. All much more powerful predictors than any one person. And yet here I am. I would take you with me if I could, you know. It’s not my choice. It’s history’s.”

“History should reconsider,” Paolo said.

Duarte chuckled. “The difference between zero and one is miraculous. But it’s as miraculous as it ever will be. Make it two. Three. A hundred. It becomes just another oligarchy. A permanent engine of inequality that will breed the wars we’re trying to end.”

Paolo made a small sound that could have been mistaken for agreement.

“The best governments in history have been kings and emperors,” Duarte said. “The worst ones too. A philosopher-king can manage great things in his lifetime. And his grandchildren can squander it.”

Duarte grunted as Paolo pulled the hypodermic port out of his arm. He didn’t need to place a bandage over the wound. The hole closed up before a drop of blood could escape. It didn’t even scab.

“If you want to create a lasting, stable social order,” Duarte said, “only

one person can ever be immortal.”

Chapter One: Drummer

The habitation ring of the transfer station at Lagrange-5 was three times the diameter of the one Drummer had lived in on Tycho, half a lifetime ago. TSL-5 had a small city's worth of offices with the same fake-marble walls and soft, full-spectrum lighting as the one they'd given her, the same crash-couch beds and water showers as her quarters there. The air had a constant smell of terpene compounds, as if the station were the largest chrysanthemum in the universe. The dome in the center of the station had berths for hundreds of ships and warehouses that seemed so numerous and deep that filling them would leave Earth as empty as a squeezed-out bulb. All those berths and warehouses were at rest now, but starting tomorrow, that would change. TSL-5 was about to be open for business, and even as tired as she was, as annoyed as she felt at having to haul herself halfway across the system for what was ultimately a ribbon-cutting ceremony, there was also an excitement to it. After three decades of struggle, Mother Earth was open for business.

The planet glowed on her wall screen, whorls of high white clouds and glimpses of the still-greenish sea beneath it. The terminator crept across, pulling a blanket of darkness and city lights behind it. The ships of the Earth-Mars Coalition Navy floated around it, dots of darkness swimming on the high sea of air. Drummer had never gone down that well, and now by the terms of the treaty she'd signed on the union's behalf, she never would. Fine with her. Her knees bothered her sometimes as it was. But as an objet d'art, Terra was hard to beat. Humanity had done its level best to kick the shit out of the slowly spinning egg. Overpopulation, exploitation, atmospheric and oceanic imbalance, and then three military-level meteor strikes, any one of which would have fucked up the dinosaurs. And here it still was, like a soldier. Scarred, broken, reimagined, rebuilt, and remade.

Time was supposed to heal all wounds. To Drummer, that was just a nice way of saying that if she waited long enough, none of the things that

seemed important to her would turn out to matter. Or at least not the way she'd thought they did.

Time, plus the combined expertise of a Martian terraforming project staggering under the loss of its mandate, the ruthless administration of Earth's political sector, and the huge market of thirteen-hundred-odd worlds all in need of biological substrates to grow food that people could actually eat had hauled Earth, slow and staggering, up to functional again.

Her system chirped, a polite little pop like someone snapping bamboo. Her private secretary's voice followed like a drink of whiskey.

"Madam President?"

"Give me a minute, Vaughn," she said.

"Yes, ma'am. But Secretary-General Li would like to speak with you before the ceremony."

"The Earth-Mars Coalition can wait until after cocktails. I'm not opening this station by jumping every time the EMC clears their throat. Bad precedent."

"Copy that. I'll handle it."

The system made the little woody tock that meant she had her privacy again. She leaned back in her chair, looked over at the images set into the wall behind her desk. All the previous Transport Union presidents before her: Michio Pa, then Tjon, Walker, Sanjrani, and her own thin, stern face looking back at her from the end. She hated that picture. It made her look like she'd just eaten something sour. The first version of it looked like something off a singles forum. At least this one was dignified.

For most of the Transport Union's members, this image was all they'd ever see of her. Thirteen hundred worlds, and within a decade most if not all of them would have their own versions of the TSL-5. Hand-off stations that marked the bubble of void where the planet's sphere of control ended and the union's began. Anything that the colonies needed from humanity's first home or from each other went up the gravity wells. That was the inner's problem. Moving it from one system to another belonged to the Belt. Old terms. Inners. Belters. They stuck because language held on to things that way, even when the reality around them had shifted.

The Earth-Mars Coalition had been the center of humanity once—the innermost of the inners. Now it was an important spoke on the wheel whose hub was Medina Station. Where the weird alien sphere sat in the middle of the not-space that linked all the ring gates. Where her civilian quarters were

when she wasn't on the void cities. Where Saba was, when he wasn't on his ship or with her. Medina Station was home.

Except that even for her, the blue-black disk of Earth on her screen was home too. Maybe that wouldn't always be true. There were kids old enough to vote now who'd never known what it meant to have only one sun. She didn't know what Earth or Mars or Sol would be to them. Maybe this atavistic melancholy just behind her breastbone would die with her generation.

Or maybe she was tired and cranky and needed a nap.

The bamboo broke again. "Ma'am?"

"I'm on my way."

"Yes, ma'am. But we have a priority message from traffic control on Medina."

Drummer leaned forward, her hands flat against the cool of the desk. Shit. Shit shit shit. "Did we lose another one?"

"No, ma'am. No lost ships."

She felt the dread loosen its grip a little. Not all the way. "What, then?"

"They're reporting an unscheduled transit. A freighter, but it didn't have a transponder."

"Seriously?" she said. "Did they think we wouldn't notice it?"

"Couldn't speak to that," Vaughn said.

She pulled up the administrative feed from Medina. She could get anything from her realm here—traffic control, environmental data, energy output, sensor arrays in any slice of the electromagnetic spectrum. But light delay made all of it a little more than four hours old. Any order she gave would come through eight, eight and a half hours after the request for it was made. The vast alien intelligence that had engineered the ring gates and the massive ruins in the systems beyond them had found ways to manipulate distance, but the speed of light was the speed of light, and seemed like it always would be.

She scrolled through the logs, found the relevant slot, played it.

Medina here. Conferme. Traffic Control's usual calm.

The responding voice had a little interference. An artifact of the gates. *This is the freighter Savage Landing out of Castila on approach, Medina. Transferring our status now.*

A new window popped up. The ship status of a light freighter. Martian design. Old, but not antiquated. It took a few seconds for Traffic to come

back.

Visé bien, Savage Landing. You are clear to transit. Control code is—fuck! Abort, Savage Landing! Do not transit!

A sudden spike on the safety curve and the alarm status blinked to red. A new drive signature appeared on Medina's control board, the plume sweeping through the starless dark of the slow zone.

It was done. All of it over with hours ago, but Drummer still felt her heartbeat pick up. Traffic was shouting for the new ship to identify itself, the rail-gun emplacements clicked to active. If they'd fired, everyone on the unauthorized ship was dead already.

The safety curve decayed, the disruption created by mass and energy passing through the ring dropping until it passed the threshold. The intruding ship spun, burning hard, and zipped through a different gate, kicking the curve back up again as it escaped.

Traffic cursed in several languages, sending stand-by messages to three other inbound ships. The *Savage Landing* was quiet, but the feed from their system showed a bruisingly hard burn as they peeled away, breaking off the approach to the Castila gate.

She rolled back, the near calamity reversing itself. The reckless asshole had come in from Freehold and passed out into Auberon. Because of course it had. The leaking radiation from the Auberon gate showed that the ship had made it. As close as it had cut the safety curve, it hadn't gone dutchman. But if the *Savage Landing* had gone through as scheduled, one or both ships could have vanished into wherever ships went when their transits failed.

In the short term, it would mean slotting *Savage Landing* in later. There'd be a bunch of pushbacks. Maybe dozens of ships that had to change their burns and coordinate new transits. Not a threat, but a pain in the ass.

And not a good precedent.

"Should I respond," Vaughn asked, "or would you rather deal with this personally, ma'am?"

It was an excellent question. Policy was a ratchet. If she pulled the trigger, gave the order that the next unauthorized ship through was going to be turned into scrap metal and regrets, it wasn't something she could pull back from. Someone much better at this than she was had taught her to be very careful doing something if she wasn't ready to do it every time from then on.

But, Christ, it was tempting.

“Have Medina log the transit, add the full cost to Freehold and Auberon’s tabs, and penalties for the delays they caused,” she said.

“Yes, ma’am,” Vaughn said. “Anything else?”

Yes, she thought, *but I don’t know what yet.*

The conference room had been designed for this moment. The vaulted ceiling looked as grand as a cathedral. Secretary-General Li of Earth stood at his podium, shifting his grave but satisfied countenance out at the cameras of dozens of different, carefully selected newsfeeds. Drummer tried to do the same.

“President Drummer!” one of the reporters called, lifting a hand for attention the same way people probably had in the forums of Rome. Her podium told her the man’s name was Carlisle Hayyam with Munhwa Ilbo’s Ceres office. A dozen others had started clamoring for her attention too.

“Hayyam?” she said, smiling, and the others quieted down. The truth was, she sort of liked this part. It appealed to some long-forgotten ambition to perform on a stage, and it was one of the few places where she felt like she was actually in control. Most of her work felt like she was trying to stuff air back into a leaking balloon.

“How do you respond to Martin Karczek’s concerns about the transfer station?”

“I’d have to listen to them,” she said. “I’ve only got so many hours in my day.”

The reporters chuckled, and she heard the glee. Yes, they were opening the first hand-off station. Yes, Earth was about to stagger up out of years of environmental crisis to ramp up its active trade with the colonies. All anyone really wanted was a couple politicians being snippy at each other.

And that was fine. As long as they kept looking at the little stuff, she could work on the big things.

Secretary-General Li, a broad-faced man with a lush mustache and a workman’s callused hands, cleared his throat. “If you don’t mind,” he said. “There are always people who are wary of change. And that’s a *good* thing. Change should be watched, moderated, and questioned. But that

conservative view shouldn't rein in progress or put a damper on hope. Earth is humanity's first and truest home. The soil from which all of us, whatever system we now inhabit, first grew. Earth will always, *always*, be central to the greater project of humanity in the universe."

Whistling past the graveyard. Earth was celebrating a huge milestone in its history, and that was maybe the third most important thing on her agenda. But how do you tell a planet that history has passed it by? Better to nod and smile, enjoy the moment and the champagne. Once this was over, she'd have to get back to work.

They moved through the expected questions: would the renegotiation of the tariff agreements be overseen by Drummer or former president Sanjrani, would the Transport Union remain neutral in the contested elections on Nova Catalunya, would the Ganymede status talks be held on Luna or Medina. There was even one question about the dead systems—Charon, Adro, and Naraka—where ring gates led to things much stranger than goldilocks-zone planetary systems. Secretary-General Li fended that one off, which was just as well. Dead systems gave Drummer the creeps.

After the Q-and-A was done, Drummer did a dozen photo ops with the secretary-general, high-level administrators from the EMC, and celebrities from the planets—a dark-skinned woman in a bright-blue sari, a pale man in a formal suit, a pair of comically identical men in matching gold dinner jackets.

There was a part of her that enjoyed this too. She suspected that the pleasure she took in Earthers clamoring to get mementos of themselves with the head of the Belters spoke poorly of her in some vague spiritual way. She'd grown up in a universe where people like her were disposable, and she'd lived long enough for fortune's wheel to lift her up higher than Earth's sky. Everyone wanted the Belt for a friend, now that the term meant more than a cloud of half-mined-out chunks of debris trapped between Mars and Jupiter. For children born today, the Belt was the thing that tied all humanity together. Semantic drift and political change. If the worst that came out of it was a little schadenfreude on her part, she could live with that.

Vaughn waited in a small antechamber. His face was a network of crags that would have done credit to a mountain range, but he managed to make it work for him. His formal jacket was cut to echo old-style vac suits. The marks of their oppression remade as high fashion. Time healed all wounds,

but it didn't erase the scars so much as decorate them.

"You have an hour before the reception, ma'am," he said as Drummer sat on the couch and rubbed her feet.

"Understood."

"Can I get you anything?"

"Encrypted tightbeam and privacy."

"Yes, ma'am," he said without missing a beat.

When the door slid closed behind him, she turned on the system camera and composed herself. The plan that had been forming in the back of her head all through the ceremonies was in place. All the bits and pieces she'd need to make it happen. And sooner was better than later. Punishment worked best when there wasn't a gap between misbehavior and consequences, or at least that was what they told her. But there was also a real advantage in giving the offender time to savor their regret.

Best of all was when she could do both.

She hit Record.

"Captain Holden," she said. "I'm linking you through to the data on an unauthorized transit from Freehold to Auberon that occurred today. I'm also giving you access to the security review of the Freehold system. It's not much. One habitable planet a little smaller than Mars, another one that's exploitable as long as you don't mind too much nitrogen and cyanide in your air. The governor of Freehold is named"

She checked the records and coughed with contempt and laughter.

"Payne Houston. I'm assuming that's his own choice and not what his mommy called him. Either way, I'm sending you under an executive mandate so that you can get going right now. I'll get Emily Santos-Baca and the security committee to genuflect over this well before you get there, so we'll be fine with that.

"Your official mission is to carry the message that Freehold's repeated violations of Transportation Union guidelines have triggered punitive action, and that I'm banning all traffic in and out of Freehold for three years. When he asks whether it's Earth years, the answer is yes. He's going to make a point of that, because that's the kind of idiot he is.

"Your unofficial mission is not to hurry. I want Freehold and all the systems like it to see a gunship moseying toward them for weeks without knowing what it's going to do when it gets there. I'll have my staff draw up the usual work agreement. If you can't take the job, let me know as soon as

possible. Otherwise, I'll have you on the roster to fuel up and make transit in the next fifteen hours."

She reviewed the message, then sent it out with a copy to Ahmed McCahill, the chair of the security committee. Then it was an executive request to push the *Rocinante* to the head of the resupply and transit authorization queues. And then Vaughn was knocking discreetly at her door.

He took her grunt as permission to come in, which it was.

"Secretary-General Li is asking whether you're indisposed, ma'am," he said. "He's getting concerned."

She checked the time. Her hour's respite had ended twenty minutes ago.

"Tell him I'm on my way," she said. "And do I have a change of clothes?"

"In the closet, ma'am," Vaughn said as he slipped out the door again, quiet as a phantom. Drummer changed quickly, shedding the formal jacket and slacks for a bamboo-silk blouse and self-tailoring skirt with a neural net woven into it that was about as intelligent as an insect just to keep the drape right. She considered herself in the mirror with a certain satisfaction. She only wished Saba were here to accompany her. But he'd probably make too many consort-of-the-queen jokes. She shut down the mirror, its screen defaulting back to the image of Earth.

The planet was over half in darkness now, a crescent of white and blue. Belters had tried to kill the Earth, but here it was still spinning. They'd tried to burn the inner planets' ships, and here was the EMC navy, scraped back together and flying.

And on the other hand, Earth had tried to choke the Belters under its boot for generations, and here was Drummer. Time had made them allies in the great expansion of civilization out to the stars.

At least until something *else* changed.

Chapter Two: Bobbie

The transit from the slow zone was behind them and Freehold was still weeks away, but an atmospheric landing in a ship as old as the *Rocinante* wasn't the trivial thing it had once been. Age showed up in unexpected ways. Things that had always worked before failed. It was something you prepared for as much as you could.

Bobbie squinted at a wall panel on the engineering deck and watched as a long list of data scrolled by, ending with the ship's reassurance that it could handle at least one more descent without burning up.

"All greens on the atmospheric braking thrusters," Bobbie said.

"Hmmm?" Alex's sleepy drawl replied from the panel.

"You awake up there? This is your damn landing prep list. I'm down here doing the work. Could at least seem interested."

"Yeah, not sleepin'," the pilot replied, "just got my own list of shit to do." She could hear his smile.

Bobbie closed the diagnostic screen. Verifying the status on the thrusters was the last item on her work order. And short of putting on a suit and climbing outside to physically look into the nozzles, there wasn't much more she could do.

"I'm going to do some housekeeping, then head up," she said.

"Mmhm."

Bobbie put her tools away and used a mild solvent to wipe up some lubricant she'd spilled. It smelled sweet and pungent, like something she'd have cooked with back when she'd been living alone on Mars. Anxiety pushed her toward preparing more for the mission even after she was prepared. In the old days, this was when she'd have cleaned and serviced her power armor again and again and again until it became a kind of meditation. Now, she went through the ship the same way.

She'd lived on the *Rocinante* for more years now than anyplace else. Longer than her childhood home. Longer than her tour in the Marines.

The engineering deck was Amos country, and the mechanic kept a tidy shop. Every tool was in its place, every surface spotless. Other than the oil and solvent, the only other smell in the compartment was the ozone scent that hinted at powerful electricity coursing nearby. The floor vibrated in time with the fusion reactor on the deck below, the ship's beating heart.

On one bulkhead, Amos painted a sign that read:

SHE TAKES CARE OF YOU
YOU TAKE CARE OF HER

Bobbie patted the words as she walked by and climbed onto the ladder lift that ran up the center of the ship. The *Roci* was at a very gentle 0.2 g braking burn, and there had been a time when riding the lift instead of climbing the ladder would have felt like admitting defeat, even if the ship was burning ten times that hard. But for the last couple years Bobbie's joints had been giving her trouble, and proving to herself that she could make the climb had stopped mattering as much.

It seemed to her that the real sign you were getting old was when you stopped needing to prove you weren't getting old.

The hatches separating each deck slid open at the lift's approach, and then quietly closed after she'd passed. The *Roci* might be a decade or two past her sell-by date, but Clarissa tolerated no sticking or squeaking on her ship. At least once a week, Claire made a complete pass through every environmental system and pressure hatch. When Bobbie had mentioned it to Holden, he'd said, *Because she broke the ship once, and she's still trying to fix it.*

The lift hummed to a stop on the ops deck, and Bobbie stepped off. The hatch up to the cockpit was open. Alex's brown and almost entirely bald head poked up over the back of the pilot's crash couch. The crew spent most of their working time in Operations, and the air felt subtly different. Long hours spent in the crash couches meant the smell of sweat never entirely went away, no matter how hard the air recyclers worked. And, like any room James Holden spent a lot of time in, the comfortable scent of old coffee lingered.

Bobbie ran a finger along the bulkhead, feeling the anti-spalling fabric crackle under the pressure. The dark-gray color had faded, and it was getting harder to tell where the fabric didn't match because it had been

damaged and patched and where it was just aging unevenly. It would need to be replaced soon. She could live with the color, but the crunching meant that it was losing its elasticity. Getting too brittle to do its job.

Both of Bobbie's shoulders ached, and it was getting trickier to tell the difference between the one that had been explosively dislocated during hand-to-hand training years before and the one that just hurt from decades of not being gentle with her body. She'd picked up a lot of battle scars during her life, and they were getting harder and harder to differentiate from the normal damage of wearing out. Like the discolored patches on the *Roci's* bulkheads, everything was just fading to match.

She climbed the short ladder up through the hatch into the cockpit, trying to enjoy the ache in her shoulders the way she'd once enjoyed the burn after an intense workout. As an old drill sergeant had told her, pain is the warrior's friend. Pain reminds you that you aren't dead yet.

"Yo," Alex said as she dropped into the gunner's chair behind him. "How's our girl look?"

"Old, but she can still get around."

"I meant the ship."

Bobbie laughed and called up the tactical display. Off in the distance, the planet Freehold. The mission. "My brother always complained I spent too much time looking for metaphors."

"An aging Martian warrior living inside an aging Martian warrior," Alex said, the smile audible in his voice. "Don't have to look too hard there."

"Not too aged to kick your ass." Bobbie zoomed in on Freehold on their tactical screen. A mottled marble of brown continents and green oceans, with the occasional white swirl of cloud. "How long?"

"We'll be there in a week."

"Talk to Jizz lately? How's my future baby daddy doing?"

"*Giselle* is fine, and she says Kit is doing great. Picked planetary engineering as his major at Mariner Tech."

"It is the hot job market right now," Bobbie agreed.

She'd been Alex's best man when he'd married *Giselle*, and she'd waited at the hospital on Ceres when Kit had been born thirteen months later. And now Kit was going into upper university, and Alex had been divorced for over a decade. He was her best friend, but he was terrible husband material. After his second failure at it Bobbie pointed out that if he just wanted something to hurt, she could break his arm for him and save

everyone time.

But for all the unnecessary drama, Alex and Giselle's short-lived trainwreck of a marriage had produced Kit, and that made the universe a better place. The boy had all of Alex's laconic charm and all of his mother's regal good looks. Every time he called her Aunt Bobbie, she wanted to hug him until his ribs cracked.

"When you reply, make sure to tell Jizz I said 'fuck off,'" Bobbie said. The failure of the marriage wasn't entirely Giselle's fault, but Bobbie had picked Alex in the divorce, so acting like she blamed his ex for everything was part of the best-friend pact. Alex pushed against it, but she knew he also appreciated her saying all the things that he couldn't.

"I'll send *Giselle* your love," Alex said.

"And tell Kit that Aunt Bobbie says hi, and I want new pictures. Everything I have of him is a year old. I wanna see how my little man is filling out."

"You know it's creepy to flirt with a kid you've known his entire life, right?"

"My love is a pure love," Bobbie replied, then switched tactical to the mission parameters. Freehold had a population of just under three hundred, all Earth-born. They called themselves an Assembly of Sovereign Citizens, whatever that meant. But the colony-ship manifest had included a lot of firearms and ammunition. And with the weeks the *Roci* had spent dropping down toward Freehold's sun, the locals had had plenty of time to work themselves up.

Reading along with her, Alex said, "Captain'll need some backup down there."

"Yeah. Talking to Amos about that is the next thing on my list."

"Taking Betsy?"

"This is probably not a Betsy-level situation, sailor," Bobbie said. Betsy was Alex's nickname for the suit of Martian Marine Recon armor she kept in the ship's cargo bay. She hadn't put the thing on in years, but she kept it operational and charged anyway. It made her feel warm and comfortable knowing it was there. Just in case.

"Copy that," Alex said.

"Where is Amos, anyway?"

It was subtle, the difference between Alex being at ease and Alex trying to sound like he was at ease. "Ship thinks he's in the sick bay," Alex said.

Clarissa, Bobbie thought. *Well, shit.*

The *Rocinante*'s medical bay smelled like antiseptic and vomit.

The antiseptic came from the little floor scrubber that was humming around the room, leaving a trail of shiny decking in its wake. The acid-and-bile smell of vomit came from Clarissa Mao.

"Bobbie," she said with a smile. She was on one of the med bay's couches, an autodoc cuff around her upper arm that buzzed and hummed and occasionally clicked. Claire's face would tighten at each click. Injections, maybe, or something worse.

"Hey, Babs," Amos said. The hulking mechanic sat at Claire's bedside reading something on his hand terminal. He didn't look up when Bobbie entered the room, but raised a hand in greeting.

"How're you feeling today?" Bobbie asked, grimacing internally as she said it.

"I'll be out of bed in a few minutes," Claire said. "Did I miss something on the pre-landing check?"

"No, no," Bobbie replied, shaking her head. She feared that Claire would tear the tubes out of her arm and leap out of bed if she said yes. "Nothing like that. I just need to borrow the lunk for a minute."

"Yeah?" Amos said, looking at her for the first time. "That okay with you, Peaches?"

"Whatever you need," she said, gesturing at the med-bay in general. "You will always find me at home."

"All right," Amos stood up, and Bobbie guided him out into the corridor.

Surrounded by the fading gray walls, and with the sick-bay hatch closed behind him, Amos seemed to deflate a little. He leaned his back against the wall and sighed. "That's tough to watch, you know?"

"How is she?"

"Good days and bad days, same as anyone," Amos said. "Those aftermarket glands she had put in keep leaking their rat shit into her blood, and we keep filtering it back out. But taking 'em back out would fuck her up worse, so ..."

Amos shrugged again. He looked tired. Bobbie had never really been

able to figure out what the relationship between the *Roci*'s mechanic and his tiny counterpart was. They weren't sleeping together, and it didn't seem like they ever had. Most of the time they didn't even talk. But when Claire's health had started its decline, Amos was usually there by her side in the sick bay. It made Bobbie wonder if he'd do that for her if she got sick. If anyone would.

The big mechanic was looking a little thinner himself these days. Where most big men tended toward pudge in their later years, Amos had gone the other direction. What fat he'd had was gone, and now his arms and neck looked ropey with old muscle just under the skin. Tougher than shoe leather.

"So," he said, "what's up?"

"Did you read my briefing on Freehold?"

"Skimmed it."

"Three hundred people who hate centralized authority and love guns. Holden's going to insist on meeting them on their turf, because that's the kind of shit he does. He'll need backup."

"Yeah," Amos agreed. "I'll keep an eye on him."

"I was thinking maybe I should take this one," Bobbie said, nodding her head toward the sick-bay hatch. Not saying, *She doesn't look good*. Amos pursed his lips, considering.

"Yeah, okay," Amos said. "Atmospheric landing will probably shake the damn ship apart. I'll have plenty to do here."

Bobbie started to leave, then something made her stop. Before she knew she was going to say it, she asked, "How much longer?"

"Rest of her life," Amos said, then went back into the sick bay and closed the hatch behind him.

She found Holden and Naomi eating breakfast in the galley. The smell of scrambled eggs with powdered onions and what passed for peppers competed with brewing coffee. Bobbie's belly growled as soon as she walked into the room, and without a word Holden pushed a plate toward her and began slopping eggs onto it.

"Enjoy, because this is the last of the real eggs until we get back to Medina," Holden said as he dished her up.

Naomi finished chewing a mouthful and said, "What's going on?"

"Did you guys read my threat assessment on Freehold?"

"Skimmed it," Holden replied.

"First-generation colony," Naomi said. "Eight years since founding, and

it's still only got one township on it in a semiarid temperate zone. Low-level agriculture, but most of the food supply is salvaged hydroponics. Some goats and chickens, but the livestock is surviving on the hydroponics too, so not the most efficient model. Lithium in the planetary crust and a weirdly lot of uranium trapped in polar glaciers that hopefully means it'll be easily harvested helium if they ever get the infrastructure to mine something. Charter that calls for radical personal autonomy enforced by a citizen militia made up of the whole colonial population."

"Really?" Holden said. "The whole population?"

"So three hundred people who like guns," Naomi said, then pointed at Holden. "This one will insist on getting off the ship and speaking to them in person."

"Right?" Bobbie said, then quickly shoveled a heaping scoop of eggs into her mouth. They were as good as her nose had promised they'd be.

"This *has* to be done face-to-face," Holden said. "If not, we could just have radioed the message to them from Medina and saved ourselves the trip."

"Diplomacy is your thing," Bobbie said. "I'm strictly concerned with tactical issues. And when we talk to the powers that be on Freehold, we'll be telling them there's no reason not to just start shooting and hope for the best."

Holden pushed his half-empty plate away and leaned back with a frown. "Explain that."

"You really should read my assessments."

Naomi grabbed Holden's mug and moved over to the coffee machine. "I think I know where she's going with this. You want any coffee, Bobbie?"

"Yes, thank you," Bobbie said, then pulled up the tactical assessment on her hand terminal. "These are people who left Earth to form a colony based on personal sovereignty. They believe in the absolute right of each citizen to defend themselves and their property, with lethal force if necessary. And they are well armed for this purpose."

"I followed that part," Holden said.

"They are also years from self-sustaining at this point. The reason they're relying on hydroponics is that they're having a difficult time developing soil for their greenhouses. Something about the mineral content. The money they've been able to get from preliminary mining futures is all going to Auberon for agricultural supplies trying to get around that. They

don't agree that the Transport Union should be taking tariffs on any basic life-sustaining trade. Which is what got us here."

Naomi handed her a steaming mug of coffee with lots of cream, just the way she liked it. Holden nodded in a way that probably meant trouble. He'd understood what she was saying.

"How long till they have local crops?" Naomi asked, leaning over her shoulder to look at the report.

"I don't know, but that's not the issue here—"

"The issue here," Holden said, "is that we're delivering a death sentence. Isn't that right? We're going to land and tell them they're cut off from trading with other colonies. And they know they're going to run out of usable food in a few months, and won't be able to grow their own for years. The union is putting them in an impossible position. And by *union* right now, I mean us. We are."

"Yes," Bobbie agreed, glad he seemed to understand. "These are people who believe in the inviolate right to use lethal force in defense of their own lives. When we land and tell them they're cut off, we'll leave them with no reason not to try to take the ship."

"I don't understand the penalty," Naomi said. "Seems harsh."

"Drummer's been waiting for this one, I'd guess," Holden said. He didn't look happy. "The first colony to really test how far the union will go to protect its monopoly on gate usage. And she's going to crush this first example so hard that no one else will even try. She's killing one colony now so she doesn't have to kill thirteen hundred colonies later."

The idea hung in the air like smoke over a poker game. Naomi's expression mirrored Bobbie's concern. Holden had the inward focus he got when he was thinking about something too hard for safety. A three-year timeout was rough. A three-year timeout when you'd start starving in less than one was something worse. Motive enough for violence, at least. Maybe something more.

"So," Bobbie said, "this is going to be interesting."

Chapter Three: Santiago Jilie Singh

Singh felt a tingle on his wrist and slid back his sleeve. The monitor wrapped around his forearm saw him look and displayed a notification of his most urgent task: the upcoming audience with the high consul.

He reset the notification timer to one-half hour before the meeting itself. His data pad had been riding on his arm or in his pocket for nearly five years. It knew everything there was to know about him. It was treating his upcoming audience with the high consul as if it were the single most important event of his life.

It wasn't wrong.

He pulled the sleeve back into place, giving it one sharp tug to smooth out any new wrinkles, and inspected himself in his mirror. His blue-and-white dress uniform fit him like a glove, emphasizing the muscular frame he spent an hour every day sculpting in the gym. The newly acquired captain's stars glittered on his collar, polished to a golden gleam. His chin and scalp were freshly shaved, and he imagined it gave him the feral, predatory quality that befit a military man.

"Still preening?" Natalia said from the bathroom. She opened the door and came out in a cloud of steam, her hair dripping wet. "A man so handsome needs to be groped, I think."

"No," Singh said, backing away. "If you get water on me—"

"Too late," his wife laughed, darting forward to grab him. She hugged him tight around the waist, her wet hair on his shoulder.

"Nat," he said, meaning to complain but finding himself unable to. Her towel had come loose when she grabbed him, and in the mirror he could see the gentle curve of her hip. He put a hand on it and squeezed. "I'm all wet now."

"You'll dry," she said, reaching behind him to pinch his butt. The newly promoted captain in the Laconian navy gave an undignified yelp. He felt another buzz in his wrist, and for a moment Singh thought the pad on his

arm was disapproving of all this tomfoolery.

He pushed his sleeve back again, and saw that it was just a notification that his car would arrive in twenty minutes.

“Car will be here soon,” he said with regret, burying his nose in his wife’s wet hair for a moment.

“And it’s time to get Elsa up,” Natalia agreed. “It’s your big day. You pick: wake the monster, or make breakfast?”

“I’ll take monster duty this morning.”

“Be careful. She’ll care even less about not messing up your clean new uniform,” Natalia said as she pulled on a robe. “Breakfast in ten, sailor.”

But it took nearly fifteen minutes to drag Elsa out of her crib, change her diaper, get her dressed, and carry her into their kitchen. Natalia had already put plates piled high with pancakes and fresh apples on the table, and the smell of chai filled the air.

Singh’s wrist buzzed, and he didn’t need to look to know it was the five-minute warning for his car. He strapped Elsa into her high chair and put the smallest plate of apple slices in front of her. She chortled and smacked her palm down onto them, spraying droplets of juice everywhere.

“Will you have time to eat?” Natalia asked.

“I’m afraid I won’t,” Singh said, pulling up his sleeve and scrolling through the day’s schedule. “Monster just did not want to put pants on today.”

“I think her single biggest disagreement with preschool is their pants requirement,” Natalia said with a smile. Then she glanced down at the meeting schedule on his arm and sobered. “What time should we expect you?”

“My meeting is scheduled for fifteen minutes at nine a.m., and I don’t have anything else today, so ...” Singh said. He did not say, *but I’m meeting with High Consul Winston Duarte, so I control nothing about when the meeting begins or ends.*

“All right,” Natalia said, then kissed his cheek. “I’ll be at the lab today until at least six, but your father agreed to monster duty if you can’t pick her up from school.”

“Fine, fine,” Singh said. “Until then.”

The dark naval staff car pulled up outside. Singh paused at the mirror by the door to give himself one final inspection, and wipe away an errant bit of Monster’s breakfast shrapnel. Natalia was at the table now, trying to eat and

also get some of Monster's own food in her mouth and off her shirt.

Dread welled up from his belly, swamping his heart. He had to swallow half a dozen times before he could speak. He loved his wife and their child more than he could say, and leaving them was always a little difficult. This was different. Generations of navy men had faced mornings like this. Meetings with superiors that heralded change. Surely, if they'd faced it, he could too.

The imperial view, a history professor at the Naval Academy once said, is the long view. Individuals build empires because they want their names to echo through time. They build massive constructs of stone and steel so that their descendants will remember the people who created the world that they only live in. There were buildings on Earth that were thousands of years old, sometimes the only remaining evidence of empires that thought they would last forever. *Hubris*, the professor had called it. When people build, they are trying to make an aspiration physical. When they die, their intentions are buried with them. All that's left is the building.

While Martian intentions had never been explicitly imperialist, they had a fair bit of this same hubris. They'd built their tunnels and warrens as temporary living space in the stone of Mars, then gotten down to the generations-spanning work of making the surface habitable.

But their first generation died with the work still unaccomplished. And the generation after that, and so on, child following parent, until the children only knew the tunnels and didn't think they were so bad. They lost sight of the larger dream because it had never been their dream. Once the creators and their intentions were gone, only the tunnels were left.

As Singh looked out at the capital city of Laconia whizzing past the car's window, he saw the same masses of material and intention. Giant stone-and-steel buildings designed to house the government of an empire that didn't exist yet. More infrastructure than Laconia on its own would need for centuries. Their columns and spires called back millennia of Terran and Martian culture, and remade them as a vision of a peculiarly human future.

If the dreams of empire failed, they'd just be big buildings that had never been used.

It was an open secret among the high-ranking officers of Laconia's military that the high consul's labs had made incredible breakthroughs in human modification. One of their most important projects was dramatic life

extension for the high consul himself. The captain that Singh had served under as a lieutenant had received an official reprimand for getting drunk and referring to the high consul as “our own little god-king.”

But Singh understood why that particular project for the high consul was so important. Empires, like buildings, are aspirations made material. When the creator dies, the intention is lost.

And so the creator couldn't be permitted to die.

If the rumors were true, and the high consul's scientists were in fact working to make him deathless, they had a chance to create the sort of empire history had only dreamed of. Stability of leadership, continuity of purpose, and a single lasting vision. Which was all well and good, but didn't explain why he had been summoned to a personal meeting with Duarte.

“We're almost there, sir,” his driver said.

“I'm ready,” Singh lied.

The State Building of Laconia was the imperial palace in all but name. It was by far the largest structure in the capital city. It was both the seat of their government and the personal dwelling space of the high consul and his daughter. After passing through a rigorous security screening administered by soldiers in state-of-the-art Laconian power armor, Singh was finally ushered inside for the very first time.

It was a little disappointing.

He wasn't sure what he'd expected. A ceiling fifty feet high, maybe, held up by rows of massive stone pillars. A red velvet carpet leading to a towering golden throne. Ministers and servants lining up for a word with the high consul and plotting intrigues in whispers. Instead, there was a foyer and waiting area lined with comfortable chairs, easy access to restrooms, and a wall monitor displaying the security rules inside the State Building. It all seemed very mundane. Very governmental.

A short, smiling man with a red jacket and black pants entered through the room's largest door and gave an almost imperceptible bow.

“Captain Santiago Singh,” he said, not making it a question.

Singh stood up, only barely stopping himself from snapping out a salute. The man didn't wear a military uniform or any rank insignia, but they were inside the home of their ruler. It carried a weight beyond protocol.

“Yes, sir. I am Captain Singh.”

“The high consul hopes you will join him in the residence for breakfast,”

the little man said.

“It would be my honor, of course.”

“Follow me,” said the little man as he exited through the same large door. Singh followed.

If the foyer of the State Building was underwhelming, the rest of the interior was positively utilitarian. Corridors lined with office space radiated off in every direction. The halls bustled with activity, people in suits and military uniforms and the same red jackets and black pants as his guide moving about. Singh made sure to salute any time he saw a rank that required it and tried to ignore everyone else. The whole human population of Laconia were the original colonists, Duarte’s fleet, and the children born there in the last few decades. He hadn’t imagined there were this many people on the planet he hadn’t met. His little guide moved through as though he didn’t see any of them and kept his same vague smile the entire time.

After a ten-minute walk through a maze of corridors and chambers, they arrived at a set of glass double doors that looked out on a large patio. His guide opened one door and ushered him through, then disappeared back into the building.

“Captain Singh!” High Consul Winston Duarte, absolute military ruler of Laconia, called out. “Please join me. Kelly, make sure the captain has a plate.”

Another man in a red jacket and black pants, this one apparently named Kelly, set a place for him, then pulled out his chair. Singh sat, dizzy and grateful he wouldn’t have to try to keep from swaying on his feet.

“High Consul, I—” Singh started, but Duarte waved him off.

“Thank you for joining me this morning. And I think we can use our military titles here. Admiral Duarte, or just Admiral is fine.”

“Of course, Admiral.”

Kelly had placed a single egg in an egg cup in front of him, and was now using tongs to put a sweet roll next to it on his plate. Singh had eaten an egg before, so while it was a luxury, it wasn’t a total mystery. The table was small—it would have been crowded with four diners—and overlooked a large patch of what looked like lovingly tended terrestrial grass. A girl of maybe twelve years sat in the middle of the grass playing with a puppy. Real chickens and Terran dogs. Unlike Noah’s ark in the old story, the ships of the first fleet had carried only a few species of animal to Laconia. Seeing

evidence of two in the same sitting was a little overwhelming. Singh tapped on the shell of his egg with his spoon to crack it, and tried to keep his bearings.

Admiral Duarte gestured at Singh's coffee cup, and Kelly poured for him. "I apologize," Duarte said, "for pulling you away from your family so early this morning."

"I serve at the pleasure of the high consul," Singh said automatically.

"Yes, yes," the admiral replied. "Natalia, right? And one daughter?"

"Yes, Admiral. Elsa. She is nearly two now."

Admiral Duarte smiled out at the girl in the grass and nodded. "It's a good age. Not the toilet-training part, but she's sleeping through the night?"

"Most nights, sir."

"It's fascinating to watch their minds start to grow around then. Learning language. Learning to identify themselves as a separate entity. The word *no* becomes magical."

"Yes, sir," Singh said.

"Don't pass up trying that pastry," the admiral said. "Our baker's a genius."

Singh nodded and took a bite. The pastry was too sweet for him, but the bitter black coffee paired with it perfectly.

Admiral Duarte smiled at him, then said, "Tell me about Captain Iwasa."

The bite of sweet roll he'd just swallowed turned into a slug of lead in his belly. Captain Iwasa had been stripped of rank and dishonorably discharged based on a report Singh had given to the admiralty. If his former commanding officer had been a personal friend of the high consul, Singh could be witnessing the end of his career. Or worse.

"I'm sorry, I—" Singh started.

"It's not an interrogation," Duarte said, his voice as soft as warm flannel. "I know all the *facts* about Captain Iwasa. I want to hear your version. You filed the original dereliction-of-duty report. What moved you to do that?"

One of his professors at the military academy had once said, *When there's no cover, the only sensible thing to do is move through the field of fire as quickly as possible*. Singh sat up straight in his chair, doing his best version of standing at attention from the sitting position.

"Sir, yes sir. Captain Iwasa failed to enforce the newly delivered naval code of military conduct, and then when asked a direct question about those guidelines, he lied to Admiral Goyer, his commanding officer, in my

presence. I sent a memo to Admiral Goyer that disputed Captain Iwasa's statements."

Duarte eyed him speculatively, no hint of anger on his face. That didn't mean anything. From all accounts, the high consul was not a demonstrative man.

"The revised code that made dereliction of duty an offense punishable by being sent to the Pen?" Admiral Duarte said.

"Yes, sir. Captain Iwasa felt this punishment to be excessive, and spoke openly about it. When two Marines were found sleeping on duty, he gave them administrative punishments instead."

"So you went over his head to Admiral Goyer."

"Sir, no sir," Singh said. He lowered his eyes to look directly into the high consul's. "I witnessed an officer lying to his superior in response to a direct question about his chain of command. I notified that officer, as was my duty."

Singh stopped, but Duarte said nothing. Just kept looking at him like he was a particularly interesting bug pinned to a corkboard. Then, as if it were a casual question, "Did you dislike Iwasa?"

"If I may speak frankly, sir," Singh asked. When Duarte nodded, he continued. "Operating within the code of military conduct is the sworn duty of every officer and enlisted man. It is the instrument by which we are a military and not just a lot of people with spaceships and guns. When an officer shows a disregard for it, they are no longer an officer. When Iwasa demonstrated a repeated and deliberate failure to uphold that code, he was no longer my commanding officer. I merely informed the next person up the chain of command of this fact."

"Do you feel now, knowing what the consequences to Iwasa were, that you did the right thing?" the admiral asked. His face and voice betrayed no opinion on the topic. He might as well have been asking if Singh wanted sugar.

"Yes, Admiral," Singh said. "Duty isn't a buffet where you pick what you want and ignore the rest. Provisional loyalty isn't loyalty. Captain Iwasa's duty was to enforce the code of conduct on those in his command. When he lied about failing to do so, it was my duty to notify his commanding officer."

The high consul nodded. It could have meant anything. "Do you miss him?"

“I do. He was my first commanding officer when I left the academy. He taught me everything I needed to know. I miss him every day,” Singh replied, and realized he wasn’t exaggerating. Iwasa’s fatal flaw had turned out to be his affection for those in his command. It made him an easy man to love.

“Captain,” Duarte said. “I have a new assignment for you.”

Singh stood up, nearly knocking his chair over, and saluted. “Captain Santiago Singh, reporting for duty, High Consul.” He knew it was ridiculous, but something about the entire conversation was surreal and ridiculous, and in the moment it just felt like the right thing to do. Duarte had the grace to treat it with respect.

“The first phase of our project is coming to an end. We are now moving on to phase two. I am giving you command of the *Gathering Storm*. The details of your orders are in the captain’s safe on that vessel.”

“Thank you, Admiral,” Singh said, his heart pounding in his chest. “It will be my honor to carry those orders out to the letter.”

Duarte turned to look out at the girl playing with her dog. “We’ve been hidden away from the rest of humanity long enough. Time we showed them what we’ve been doing.”

Chapter Four: Holden

Holden had been in his twenties when the Earth Navy kicked him out. He looked back at that version of himself with the kind of fondness and indulgence that people usually extended to puppies that were overly proud of themselves for scaring off a squirrel. He'd signed up to work ice-hauling runs with a sense of turning his back on the whole corrupt, authoritarian, cynical history of his species. Even the name of the company he'd signed on with—Pur 'n' Kleen—had seemed rich with meaning. A promise of integrity and purity. If it was also a little cartoonish, it hadn't felt like that at the time.

Back then, the Belt had been the rugged frontier. The UN and the Martian Congressional Republic, the political gods of a solar system more isolated than an ancient island in the middle of the ocean. Belters had been a structural underclass fighting to have people on the inner planets even notice when they were dying.

Now humanity was scattered to more than thirteen hundred new solar systems, and Earth might not even be the most hospitable planet for human life. Anytime a few like-minded people could put together the resources for a colony and the fees for passage through the ring gates, the seeds of a new society could be sown out there among the stars. Even the most populous of the new systems only had eight or ten cities on a whole planet. It was a massive parallel experiment in the possible forms of human collective, a chance to remake the structure of culture itself. But somehow, it all wound up seeming very familiar.

"What makes you people believe you have the right to dictate trade between sovereign states?" Governor Payne Houston of Freehold demanded. "We are a free people. And despite what your masters on Medina may think, we do not answer to *you*."

When Houston had come into the meeting, he'd already been pretty worked up, and Holden hadn't had much opportunity to talk him back down

to a meaningful, productive level of raising hell just yet. Instead, he watched and listened and tried to decide whether the governor's anger was based more in fear, frustration, or narcissism. Fear, Holden could understand. Frustration would have made sense too. All the planets connected by the ring gate had their own biomes, their own biologies, their own unexpected obstacles for someone trying to carve out an environmental niche for humans. Being able to trade for what they needed was quite often the difference between life and death. Anyone who thought they and the people they cared about were being arbitrarily blocked from the things they needed would be scared down to their bones.

The more the governor went on, though, the more it seemed like the guy was just an asshole.

"Freehold is an independent sovereign state," Houston said, slapping his table with an open palm. "We will engage in trade with willing partners, and we will not pay tribute to parasites like you, sir. We will *not*."

The council chamber was built like a courtroom, with Holden and Bobbie sitting at a low table and the governor and his eleven cabinet members above them looking down like a panel of judges. Their table was a dark-stained wood analog. Windows behind Houston and his cohort silhouetted them. Interior design as a political tool. The sidearms that all the Freeholders wore underscored it.

He glanced over at Bobbie. Her expression was calm, but her gaze shifted between the people looking down at them, then to the guards at the door. Calculating who she'd take out first, how she'd disarm them, where to take cover, how to escape. It was something Bobbie did the way other people knitted.

"So here's the thing," Holden said as Houston took a breath. "You think I'm here to negotiate with you. I'm not."

Houston scowled. "There is a right given by God to all free men, and we will have no tyrants or kings—"

"I understand why you're confused," Holden said, his voice louder, but still friendly. "You see a gunship coming out. Takes weeks to get here. You think this must be something where we're expecting a lot of give and take. Light delay would make back and forth awkward, so it makes sense to have someone right here breathing your air, right? You say something, we say something. No lag. But the thing is, the Transport Union has already decided what's going to happen. We aren't mediators. We're not looking for

an amicable solution.”

The woman to Houston’s left put a hand on his arm. Houston leaned back. That was interesting. Holden shifted a little, speaking to the space between the two of them to include her in the conversation.

“We’re all adults here,” Holden said. “We don’t need to pretend with each other. The union sent us here in person because they don’t want to have to do this kind of thing over and over with a bunch of other colonies. They wanted to make sure that everyone else was watching this situation. Especially your friends and trading partners on Auberon.”

“Political theater,” Houston said with contempt in his voice. Which was kind of funny coming from a guy sitting a meter and a half higher than he needed to.

“Sure,” Holden said. “Anyway, here’s the thing. You sent a ship through the gates without authorization. You endangered the other ships using the gates—”

Houston huffed and waved a dismissive hand.

“—and there are consequences for that kind of thing,” Holden went on. “We’re just here to tell you what they are.”

Bobbie shifted her chair, turning it out so her legs were free. It might have been a casual gesture, except that it wasn’t. Holden ran his hands over the top of the table. Whatever it was made from wasn’t wood, but it had the same hardness and subtle texture. Houston and his cabinet were quiet. He had their attention now.

Holden needed to decide what to do with it. Follow instructions or fudge it a little.

“There are two ways this can go,” he said, fudging a little. “The first one is the union cuts off gate access to Freehold for three years.”

“We aren’t self-sustaining yet,” one of the other cabinet members said. “You’re talking about a death sentence for three hundred people.”

“That’s a decision you folks made when you sent your unauthorized ship through the gates,” Holden said. “Or maybe you can find some way to up the timetable. Get a way to feed people sooner. That’s up to you. But for three years, any ship going in or out of the Freehold gate gets killed without warning. No exceptions. Communications in and out of the gate are jammed. You’re on your own. Or, option two is Governor Houston comes with us for trial and probably just a whole lot of jail time.”

Houston snorted. His expression looked like he’d taken a bite of

something rotten. The other people on the bench were less demonstrative. Freehold was a colony of pretty good poker faces.

“You forget the third option,” Houston said. “Being the ambassador of tyranny is a job with risks, Captain Holden. Very. Real. Risks.”

“Okay, so let’s do the math on that,” Holden said. “We’re here, and there are a dozen of you up there and four guards at the doors—”

“Six,” Bobbie said.

“Six guards at the doors,” Holden said, not missing a beat. “If you just look at the hundred or so meters around this building, we’re totally outnumbered and outgunned. *But* if you expand that to half a klick out, I have a gunship. My gunship has PDCs. It has a rail gun. It has twenty torpedoes. Hell, it’s got an Epstein drive that can put out a plume that would glass this whole settlement if we pointed it at the right angle.”

“So force,” Houston said, shaking his head. “Taxation always comes at the end of a gun.”

“I thought of it more as an argument against shooting ambassadors,” Holden said. “We’re leaving now and going back to our ship. Twelve hours after we get there, we’re taking off. If we have Governor Houston here on board, you can start scheduling ships with the union again. If not, we’ll send someone back in three years to check in.”

Holden stood up, Bobbie following his lead so closely that she was on her feet before him. Houston leaned forward, his left hand on the table and his right at his side like it was resting on the butt of a gun. Before the governor could say anything, Holden started for the door. The guards watched him step forward, their eyes cutting from him to Bobbie, then up to Houston. In Holden’s peripheral vision, Bobbie settled a little deeper into her legs, her center of gravity solidifying. She was humming softly, but he couldn’t quite pick out the melody.

As they reached the door, the guards stood aside, and Holden started breathing again. A short corridor to the anteroom, then out to the dirty street. He eased his hand terminal out of his pocket as they walked. Alex picked up the connection as soon as he put in the request.

“How’s it going out there?” Alex asked.

“We’re on our way back now,” Holden said. “Make sure the airlock’s open when we get there.”

“You coming in hot?” Alex asked.

“Maybe,” Holden said.

“Copy that. I’ll have the welcome mat out and the PDCs warmed up.”

“Thank you for that,” Holden said and dropped the connection.

“You really think they’ll be dumb enough to make a play?” Bobbie asked.

“I don’t want to bet my life on other people being smart,” Holden said.

“Voice of experience?”

“I’ve been hurt before.”

Freehold was the name of the town and the planet and the solar system. Holden couldn’t say which had come first. The town nestled in a valley between two ridge mountains. A soft breeze smelled faintly of acetate and mint, by-products of whatever chemistry the local biosphere had figured out for its life cycles.

The sunlight was subtly redder than Holden expected, making the shadows seem blue and giving the sense of permanent twilight. Or maybe dawn. A flock of local bird-analogs flew overhead in a V, their wide, transparent wings buzzing in an eerie harmony. It was a beautiful planet in its way. The gravity was a little less than half a g—more than Mars, less than Earth—and the planetary tilt and spin made the daylight just eight hours and change, the night a little over nine. Two minor moons were tide-locked to a big one almost a third the mass of the planet. The large moon even had a thin atmosphere, but nothing lived there. Not yet, anyway. If Freehold made it another few generations, someone would probably put another little town up there too, if only to get away from the locals. That seemed to be the human pattern—reach out to the unknown and then make it into the sort of thing you left in the first place. In Holden’s experience, humanity’s drive out into the universe was maybe one part hunger for adventure and exploration to two parts just wanting to get the hell away from each other.

It was always strange seeing the *Rocinante* on her belly. The ship had been designed to rest that way when it came down the gravity well. It didn’t do any damage. It just seemed wrong. The PDCs that studded her side shifted as they got closer, restless and active. The crew airlock stood open, a length of ladder leading down to the ground. Amos sat with his legs dangling over the lip of the open airlock door, a rifle resting across his thighs. Holden was a little surprised that Clarissa wasn’t there with him. Bobbie waved as they drew close, and Amos lifted his hand in response without taking his eyes off the trail behind them.

Holden went up first, then turned, standing between the ladder and Amos while Bobbie clambered up to them. Back toward the town, four people stood in a clump, not coming close, but clearly watching. At this distance, Holden wasn't sure if they'd been at the meeting or if they were new. Bobbie hit the panel, and the ladder retracted into the ship.

"How'd it go?" Amos asked, levering himself to his feet and stepping back from the outer door.

Bobbie cycled the door closed, raising her voice over the sound of the servos. "Back with no shots fired. I count that as a win."

The inner door opened, and Amos stowed the rifle in a locker that their weird orientation made look like a drawer. Holden walked along the wall, heading toward the ops deck. Which should have been up, but was, for the moment, to the left.

"I'm going to be glad when we're out of here," he said.

Amos smiled, the expression amiable and empty as ever, and followed after. Naomi and Alex were sitting in their crash couches, playing a complex combat-simulation game that they'd picked up in the last couple of years. Holden was reassured to see an exterior feed of the path to the town on both of their screens. Whatever else they were doing to pass the time, everyone was keeping their eyes on the town. Just in case.

"Hey, there, Captain," Alex said, his drawl a little thicker than usual. "We ready to pull up stakes and mosey on out of here?"

"We're waiting twelve hours," Holden said, sitting in his couch. The gimbals didn't shift. The fixed gravity of the planet meant all the couches were locked in place, their workstations rotated to the correct orientation. Naomi twisted to look at him.

"Twelve hours? For what?"

"I may have renegotiated the deal a little," he said. "I said if they turned over the governor to us for trial, there wouldn't be a quarantine."

Naomi lifted an eyebrow. "Does the union know about this?"

"I figured I'd send them a message when I got back here."

"You think Drummer'll be okay with it?"

"Cap changing the rules?" Amos said with a shrug. "That's just a day that ends in y far as I can tell. If she didn't leave some wiggle room for it, that's her mistake."

"I'm not going to hold the whole colony responsible for what a few administrators did," Holden said. "It's collective punishment, and it's not

the kind of thing that the good guys should do.”

“At least not without twelve hours’ warning?” Naomi said.

Holden shrugged. “This is the window they have to make a choice. If they have the chance to do something different and they still double down, I feel a little better about closing them off. At least we’ll have tried.”

“‘A little better’ meaning ‘not totally guilt-ridden.’”

“Not totally,” Holden said, lying back. The gel was cool against the back of his head and shoulders. “Still don’t love the whole cutting-people-off-from-supplies-they-need thing.”

“Should have agreed to run the union when you had the chance,” Alex said. “Then it could all be the way you wanted.”

“It’d be pretty to think so anyway,” Holden said.

Twelve hours. A night and part of a day, for Freehold. And not quite enough time for a message to go from the *Roci* to Medina to the office of the president of the Transport Union and come back again. If Drummer threw a fit, they’d still be burning for Medina before her message came through. He’d have given the Freeholders more time to think things through if he could have. But lightspeed was lightspeed.

It was the irony of making threats while having mass. The messages and voices, culture and conversation, could move so much more quickly than even the fastest ship. In the best case, it would have made persuasion and argument much more important. Moving ideas across the gap between planets was easy. Moving objects was hard. But it meant that whoever was on the other side had to be listening and willing to let their minds be changed. For all the other times, it was gunships and threats, same as ever.

Holden was asleep when the answer finally came.

“Wake up,” Naomi said. “We’ve got visitors.”

He wiped his eyes, swung his feet to the wall that was now temporarily the floor, ran his hands through his hair, and looked blearily at the screen. A crowd of people were outside the ship. He recognized a couple of the faces from the council meeting. And in the middle of them, Governor Houston was hog-tied in a wide, gray ceramic wheelbarrow. The relief that poured through Holden’s body was only tempered a little bit by the prospect of

months on the burn with the disgraced governor on board.

He opened a connection. "This is Captain Holden of the *Rocinante*. Hang tight. We'll be right out."

"Be careful," Naomi said. "Just because this looks like one thing, that doesn't mean it can't be something different."

"Right," he said, opening a connection to ops. "Alex? You there?"

"He's sleeping," Clarissa answered. "I have the PDCs warmed up, and Amos and Bobbie are on their way to the airlock. If it's an ambush, it will be a very unsuccessful one."

"Thank you for that," Holden said, walking along the side of the lift shaft toward the airlock. The mixed voices of Bobbie and Amos already echoed down toward him.

"Give the sign if you need me to do more than watch," Clarissa said, and cut the connection.

When the airlock opened and they lowered the ladder, Holden went first. A woman with sharp features and thick gray-black hair pulled back in a bun stepped out toward him.

"Captain Holden," she said. "I'm Interim Governor Semple Marks. We're here to accede to your government's demands."

"Thank you for that," Holden said as Bobbie slid down the ladder behind him. Amos followed, his shotgun clanking as he came.

"We're lodging a formal complaint with the union about this infringement on our sovereignty," Marks said. "This should have been handled internally in Freehold."

"I'll let you take that up with the union," Holden said. "Thank you for being willing to bend on this one. I didn't want to quarantine your system."

Marks' eyes said, *I think you did*, but she stayed silent. Bobbie helped the prisoner to his feet. Houston's face was gray where it wasn't red. He seemed unsteady.

"Hey," Amos said. A moment later, Houston seemed to find him. Amos nodded encouragement. "I'm Amos. This is Bobbie. We've done this kind of duty before, so there's some rules about how this goes you're going to want to listen to very carefully ..."

Chapter Five: Drummer

Drummer didn't want to be awake, but she was. The couch was built for the two of them, Saba and her. Acceleration gel over a frame designed to give them freedom to spoon while People's Home, first and largest of the void cities, was spun up or under gentler thrust or to divide them if they went into an unexpected hard burn while they were asleep. Balancing to keep from shifting the couch and troubling Saba, she checked the system console in the wall nearest her bedside. It was still two hours before she needed to get up. Not long enough for a full sleep cycle. Not short enough to ignore. She was, by some measures, the most influential woman in thirteen hundred worlds, but it didn't fix insomnia.

Saba shifted in his sleep and muttered something she couldn't make out. Drummer put a hand on his back, petting down his spine, not sure if she hoped to quiet him back to sleep or wake him up. He picked the former, snuggling himself down into the gel the way animals in their nests had been doing since before humanity had been more than an upstart hamster trying to avoid the dinosaurs.

She smiled in the darkness and tried not to be disappointed. She needed to pee, but if she got up now, it would wake Saba for certain, and then she'd feel bad. She could suffer a little instead. People's Home muttered around her like it was glad to have her back.

There were ways that she didn't have a home anymore. Hadn't since she'd accepted the presidency. Their quarters on Medina near the administration levels. The captain's cabin of Saba's ship, the *Malaclypse*. Back before she'd become the leader of the Transport Union, they'd been enough. Now she had more space devoted to her than she would ever see. Like a palace minced and scattered across light-years. Medina Station, Ganymede, Ceres, Pallas, Iapetus, Europa. The *Vanderpoele*, which was at her disposal as long as she held office. TSL-5 had quarters set aside for her, as would all the transfer stations when they were built. And the three void

cities that made up the spine of the Belters' dominion: Independence and Guard of Passage and People's Home.

At rest, the central core of People's Home stayed on the float, seventy decks of permanent facilities and infrastructure that wore the drum section like a cloak. The dock at one end, the drive at the other. Magnetic fields more powerful than a maglev track held the core separate from the drum levels and corrected when the drum spun up, holding the core stationary while the body shifted from thrust gravity to spin. The rooms and hallways in the drum were fashioned to shift, their floors orthogonal to the direction of thrust when the drive was on, their feet pointing down to the stars at a constant tenth of a g when they were at rest. Enough to make a consistent up and down, but light enough for even the most float-adapted. Not a ship, but a city that had never suffered a gravity well.

Saba yawned and stretched, his eyes still shut. Drummer ran a hand over his wire-brush hair, a little more insistently this time. His eyes opened and his wicked little half smile flickered on and then off again.

"Are you up?" she asked, trying to keep her voice soft, but really wanting the answer to be yes.

"Yes."

"Thank God," she said, and hauled herself up off the couch and went to the head. By the time she was back, Saba was standing naked at the little tea dispenser that had been provided for the exclusive use of the president. Saba had been with her for almost a decade now, and if his age showed a little in the softness of his belly and the roundness of his face, he was still a very pretty man. Sometimes, seeing him like this, she wondered whether she was aging as gracefully. She hoped so, or if not, that he didn't notice.

"Another beautiful morning in the corridors of power, ah?" he said.

"Budget hearings in the morning, trade approval in the afternoon. And Carrie Fisk and her fucking Association of Worlds."

"And fish on Friday," he said, turning to hand her a bulb of hot tea. As little time as People's Home spent on the float, she might as well have had Earther cups. But she never would. "What's an Association of Worlds?"

"That's the question, isn't it?" Drummer said. "Right now it's a couple dozen colonies that feel like I'd listen to them better if they spoke with one voice."

"Are they right?"

He took another bulb for himself and leaned against the wall. He had a

weirdly intense way of listening. More than his eyes, it was what made him pretty. Drummer sat on the couch, scowled at nothing in particular and everything in general. “Yes,” she said at last.

“And so you don’t like them?”

“I don’t dislike them,” Drummer said and took a sip of her tea. It was green and flavored with honey and still just a little too hot. “They’ve been around since Sanjrani, in one form or another. It’s all been sternly worded press releases and political grandstanding.”

“And now?”

“Sternly worded press releases, grandstanding, with occasional meetings,” she said. “But that actually means something. I didn’t use to have to make room on the agenda for them. Now it seems like I do.”

“What of Freehold?”

“Auberon is more the issue,” she said. “There’s talk that they’re making progress toward a universal polypeptide cross-generator.”

“And what is that, when it’s at home?”

It was a mechanism for pouring whatever toxic, half-assed soup the biospheres of the scattered planets had come up with into one end of a machine and getting something that humanity could eat out the other. Which meant sometime in the next ten or fifteen years, the effective end of Sol system’s monopoly on soil and farming substrates. And it meant Auberon was about to become the new superpower in the wide-flung paths of the human diaspora, provided that Earth and Mars didn’t decide to fly a navy out through the gates and start the first interstellar war.

All assuming, of course, that the breakthrough wasn’t vapor and tricks, which she wasn’t ready to discount. Every great nation, they said, was founded on a knife and a lie.

“I’m not supposed to talk about that,” she said. “I’m sorry. I shouldn’t have mentioned it.”

Saba’s face went hard for a moment, but he pushed it back into a smile again. He hated it when she closed him out of things, but however much she trusted him—however much the union’s security division had cleared him—he wasn’t in the chain of authority. Drummer had spent too much of her life enforcing security protocols to ignore them now.

“The upshot is,” she said, trying to bring him in enough to salve his feelings and still not say anything compromising, “that Freehold is, among other things, a warning to Auberon not to get too cocky, and Carrie Fisk and

the Association of Worlds is sniffing around to see if there's any opportunities in it for them. Including how far they can push me."

Saba nodded and, to her mild disappointment, started to get dressed. "So more palace intrigue, savvy sa?" he said.

"Comes down to that," Drummer said, apologizing and also being angry for apologizing, even if it was only by implication.

Saba saw the storm in her almost before she knew it was there. He stepped over to her, knelt at her feet, and put his head in her lap. She coughed out a laugh and patted his hair again. It was an obeisance that he didn't mean, and she knew it. He knew it too. But even if it didn't mean he was actually abasing himself before her, it still meant something.

"You should stay another night," she said.

"I shouldn't. I have crew and cargo and a reputation as a free man to maintain." The laughter in his voice pulled the sting a little bit.

"You should come back soon, then," she said. "And stop hooking up with all the girls on Medina."

"I would never be unfaithful to you."

"Damned right you wouldn't," Drummer said, but there was laughter in her voice too now. Drummer knew that she wasn't an easy woman to love. Or even to work with. There weren't many people in the vast span of the universe that could navigate her moods, but Saba was one of them. Was the best at it of anyone.

The system made its broken bamboo tock. Vaughn, making the first approach of the day. Soon, there would be briefings and meetings and conversations off the record with people she liked or trusted or needed, but never all three at once. She felt Saba's sigh more than she heard it.

"Stay," she said.

"Come with me."

"I love you."

"Te amo, Camina," he said, and rose to his feet. "And I will flitter off to Medina and back so quickly you'll hardly know I was gone."

They kissed once, and then he left, and the cabin seemed empty. Hollow as a bell. The system made another little tock.

"I'll be there in five," she said.

"Yes, ma'am," Vaughn replied.

She dressed, did her hair, and was in the office in slightly less than fifteen minutes, but Vaughn didn't chide her for it.

“What’s up first today?” she asked as he handed her a little cup of white kibble and sauce.

His hesitation was almost too small to notice. But only almost. “Message came in from Captain Holden of the *Rocinante*.”

“Sum it up?”

The hesitation was more pronounced this time. “Perhaps you should watch it, ma’am.”

The meeting room was on the outermost deck of the People’s Home drum. Coriolis in the void city was trivial to anyone who’d spent time on a ring station, but outsiders who’d only known mass and acceleration gravity before still found it bothersome. The walls were a pearlescent gray, the table a veneer of blond bamboo over titanium that was bolted straight to the deck. Drummer sat at its head, seething. Most of the others around her—Emily Santos-Baca, Ahmed McCahill, Taryn Hong, and all the other representatives of the board and budget office—knew her well enough to gauge her mood and tread lightly. The poor man making the presentation had never met her before.

“It’s been a question of priorities,” the man said. His name was Fayeze Okoye-Sarkis, and he’d come to speak on behalf of some kind of nongovernmental, nonacademic group that pushed for science research. Chernev Institute, based out of Ganymede and Luna. “Over the last decades—really since the bombardment of Earth—the vast, *vast* majority of research has been in increasing food yield and infrastructure. And mostly, it’s been reverse engineering the technology that made things like the protomolecule and the ring station. Every planet we’ve been to has had artifacts and old technologies.”

“Yes,” Drummer said. Meaning *Get on with it*. Okoye-Sarkis smiled like he was used to people finding him charming.

“When my wife was an undergraduate, back in the day,” he said, “her fieldwork involved tracking rodent species that had adapted to live in high-radiation zones. Old reactors and fission test sites. They had evolved to fit into environments that were specifically created. By humans. Well, we’re those rodents now. We’re adapting ourselves into spaces and environments

that were left behind by the vanished species or groups of species that created all this. The changes in technology we've seen are immense, and they promise to be just the beginning."

"Okay," Drummer said. Okoye-Sarkis took a drink of water from a bulb. The furrows in his forehead said he knew he was losing her. Hopefully it would make him tighten the presentation up, skip the boring parts, and get to what he wanted so she could say no and get back to her job.

"There has been a lot of speculation about what sort of beings built all the things we've found. Whether they were conscious individuals like us or some kind of hive mind. Whether they were one species in a community or a variety of interconnected species acting in concert. Whether—and I know this sounds weird—whether they had the same relationship to matter that we do. There's been a lot of great thought. Great theory. What there hasn't been is testing. The Chernev Institute wants to be the spearhead for a new generation of scientific research into the deepest questions that the ring gates embody. Who or what built them? What happened to those species between the time they launched Phoebe and the creation of the Sol gate? Did they leave records that we can translate and understand? Our belief is that somewhere in the systems on the far side of the gates or within the gates themselves, we will find something that acts like a kind of Rosetta stone. Something that places all the other discoveries in context. Our goal is to crack the present work in materials science, high- and low-energy physics, biology, botany, geology, even the philosophy of science wide open."

Drummer leaned back in her chair, tilted her head. "So ... you think the problem is that things aren't changing fast enough?"

"Well, I think that progress is always better and more efficient when—"

"Because it seems to me," Drummer interrupted, "like we're on the ragged edge of being able to deal with what's already on our plate. I don't see how more growing pains are going to help us."

"This is meant to help us with growing pains," the man said. He delivered the line with a certainty and authority that Drummer respected as a performance. He was a charismatic little shit. She saw why they'd sent him. To her left, Emily Santos-Baca cleared her throat in a way that might have meant nothing, but if it meant anything, it meant a lot. Drummer was being an asshole. With a conscious effort, she pulled her irritation back.

"Fair enough," she said. "And how does the union fit in with this?"

“There are several things that the Transport Union can do to help with the effort. The first being, of course, a contract to grant passage to Institute ships. We’ve got fieldwork proposals for sites on half a dozen planets whose preliminary surveys look most promising. But we have to get there first.” His grin was an invitation for her to smile back.

“That makes sense,” Drummer said. His grin lost its edge.

“The other thing that we’d like to open a conversation about ... the Transport Union is in a singular position. The fruits of our work stand to benefit the union as much or more than anyone else in any system.”

“And so you’d like us to underwrite your work,” Drummer said. “Is that it?”

“I had some more preliminaries that help lay the groundwork for why,” Okoye-Sarkis said, “but yes.”

“You understand we aren’t a government,” Drummer said. “We’re a shipping union. We take things from one place to another and protect the infrastructure that lets us do that. Research contracts aren’t really in our line.”

Okoye-Sarkis looked around the table, searching for sympathetic eyes. Maybe he even found a few. Drummer knew that her reaction might have been different if the proposal had been made a day earlier. But Holden’s message from Freehold ...

“The Institute respects that, ma’am,” Okoye-Sarkis said. “This is a very new project, but one I think has the potential to yield real benefits for everyone. I have a breakdown of our mission proposals I can leave with you and whoever in your staff wants to look at them.”

“All right,” Drummer said.

“And the passage agreement. I don’t mean to press, but we’re still getting our backers together, and the fees—”

“Give us your proposals,” Drummer said. “The board can go over them. Whatever conclusion they make about reducing or waiving the contract fees will be fine with me.”

“Thank you, Madam President. That’s wonderful. Thank you very much.”

The scientist practically bowed himself out of the room. Drummer ticked off the last entry in her morning agenda. The afternoon’s list looked just as long and at least equally irritating. Santos-Baca caught her eye and lifted an eyebrow.

“It’s an interesting proposal. It should make for a lively debate,” she said, meaning *I see you just gave the board another issue to deal with*.

“It’s important that the board be involved in any serious decisions,” Drummer said, meaning *Suck it up*. Emily Santos-Baca chuckled, and half against her will, Drummer smiled. But only for a few seconds.

She suffered through the small talk and pleasantries that came before and after all meetings like social plaque, then went back to her private office as soon as she could. Vaughn or one of his staff had left a bowl of soy pasta with mushrooms and a glass of wine for her. She started with the wine.

She pulled up the display of the full Sol system. Planets, void cities, stations. The asteroids swirling in the complex orbital dances where gravity and system geography made pools of stability. It looked like images of a snowstorm on Earth. She’d never seen snow to know how accurate that was.

She cut out most of the data, simplifying it enough for a human eye to make sense of. There was People’s Home, in Mars’ orbit, but not near the planet. And there, nearer the ring gate, was Independence. She placed a query, and the *Malaclypse* appeared—a single bright-yellow dot that seemed like it was almost on top of People’s Home. Like the ship had never left.

It was a failure of scale. That superposition of light in the display was a hundred thousand kilometers by now. More than the circumference of Earth twice over and getting larger every second. It was just that the unbridgeable distance between her and Saba was nothing compared to the vastness around them. Here in the system, and then out in all the other systems beyond the gates.

Even for a woman born to the void, it was overwhelming. And everyone seemed to want her to control it for them. To take responsibility for it all so that they could feel like someone, somewhere was in charge.

She’d never have said it aloud, but there was part of her that missed the way it had been in her youth. The Belt had been the OPA. Earth and Mars had been the enemy. That had seemed overwhelming at the time. It was only everything that had happened since then that made it seem small and manageable by comparison. A nostalgia for the age that had forged her into who she was. That had given her all the skills she’d needed and then changed into a place where half the time she felt like an impostor in her

own clothes.

The *Rocinante* was light-hours away through the gates. Light-centuries by more traditional paths. She pictured Holden as if he were across the table. She took a deep breath, let it out slowly, and then started the recording.

“Captain Holden. I’ve gotten your status report about the situation on Freehold. Politely put, your proposed solution isn’t going to work ...”

OceanofPDF.com

Chapter Six: Holden

Politely put,” Drummer said on the screen, “your proposed solution isn’t going to work. What you’re doing would fundamentally change the union. Jailing someone isn’t a thing we do. We’re a transport union, not a police force. We don’t have prisons. We don’t have prisoners. We don’t have judges. We have *contracts*. When someone breaks the terms of the contract, we object. Then we levy fines and penalties. And then, if they still won’t do what they said, we stop playing with them. What we don’t do is *arrest* them.”

“She sounds pissed,” Alex said.

Holden paused the message playback. The ops deck was dim, the way Alex liked it. The air recycler clicked and the drive hummed through the bones of the ship, as familiar as silence.

“Yeah,” Holden said. “That doesn’t sound like her happy voice, does it?”

Alex scratched at his beard and gave Holden a sympathetic shrug. “You want to finish that someplace private?”

“I don’t think that’ll make it better.” Holden took the pause back off, and Drummer sprang back into motion.

“The other thing we don’t do is let everyone who captains a ship on our registry make their own policies for the union as a whole. What you did on Freehold doesn’t get to set precedent for what I have to do on every other system that decides to break the rules. I sent you out there with a mission to deliver a message. Not negotiate. Not broker deals. You were there because it was important for everyone else who’s watching—and *everyone’s* watching—to see what happens when you break the terms of your contract with the Transport Union.”

“So it was theater first, and *then* an execution,” Holden said to the screen. Not that she could hear him. Still, she paused, looked down, and gathered herself as if she had.

“My problem now,” she said, “is how to fix what you’ve broken with the least amount of damage. I will be consulting with the board and our legal counsel, and when we decide what needs to happen, I’ll tell you. And you’ll do it. I really hope this is clear enough that it doesn’t confuse you.”

“I’m getting the feeling she may not actually like me,” Holden said.

“She’s working herself up a little,” Alex said. “I wouldn’t take it personally.”

“For now,” Drummer said, “I am instructing you to proceed on to Medina with Governor Houston. I will have someone ready to meet your ship when you dock. At that time, I will expect you to read a statement that I will put together for you. It may be an apology. It may be a clarification of the Transport Union rules. Whatever it is, I’ll deliver it to you before you get there. And you’ll recite it word for word.

“You don’t get to make the universe be what you want just by saying it, Holden. There are other people who live here too. Next time, show some respect.”

The message ended. Alex blew out a long, slow breath. “Well, maybe take it a little personally,” he said as Holden closed the message out. The screen returned to its series of rolling system reports. Drive output, environmental stability, waste-heat management. The *Rocinante* doing what she did best. What she always did. The knot in his stomach sat there, quietly. He couldn’t tell if it was anger or disappointment or something else altogether.

Alex cracked his knuckles. “You’ve got that look,” he said.

“No, I don’t,” Holden said. “I don’t look like anything.”

“She’s got a point. There’s a lot of colonies out there. If we’re going to start hauling in bad guys from all of them ... well, there’s a lot of mission creep in that. Telling them they can’t come play if they won’t play nice? It’s rough, but it doesn’t change what the Transport Union *is*, you know?”

“It’s more convenient,” Holden said more sharply than he’d intended. “It is. No, I see that. I understand that it’s easier to run the union if everything’s in terms of who’s violated the terms of the contract and withholding service and ... and give it a few more decades so the colonies are all able to support themselves, maybe cutting off trade will be a slap on the wrist. But the fact of the matter right now? It’s a death sentence.”

“Maybe,” Alex said. “What I heard about Bara Gaon Complex and Auberon, they’re already—”

“This isn’t Bara Gaon Complex or Auberon. This is Freehold. If we cut them off for three years, the colony would collapse, and they’d all starve. So right now, yeah, she’s saying we should kill them. Only she’s phrasing it so it sounds like it’s just the natural consequence of *their* choices and not also *ours*.”

“Well, yeah,” Alex said, but Holden wasn’t done. The words kept pushing their way out of him.

“They didn’t vote for Drummer,” he said, tapping hard on the screen. “They can’t appeal her decisions, and she has the power of life and death over them. She needs to be held to a higher standard than ‘whatever’s most convenient.’ And in every military service in history, when the commander gave an immoral command, it was the *duty* of the soldiers to disobey it.”

“Every military service in history?”

“All the good ones.”

“All right,” Alex said. Then a moment later, “They didn’t elect us either.”

“Exactly! That’s my *point*.”

“Right,” Alex said.

“So we’re agreeing with each other.”

“Yes. But it still kind of sounds like we’re fighting.”

“It does,” Holden said, and leaned back. His crash couch shifted under him, hissing. The tightness in his gut hadn’t lessened at all. He’d really hoped it would. “Shit.”

“You think she’s going to shut them out again? Put the quarantine back in place?”

“I don’t know,” Holden said. “Except if she was going to do that, she’d probably make us take Houston back to die with his friends. And it doesn’t do great things for your political dog-and-pony show when the captain of one of your pet gunships starts refusing your orders. She’ll have to give us this one.”

“That sounds right,” Alex agreed. “Next one’s going to be interesting, though.”

“Yeah.”

They were quiet for a moment. He knew Alex was going to speak even before the words came. Decades of living and working in the same place meant you never had to ask for someone to pass the salt at galley time. This was just the same.

“If you want, we could yell at each other some more.”

“Thanks,” Holden said. Alex nodded. It was an open invitation, and only half a joke. He consulted his gut again, then pulled himself up and headed for the lift. Alex didn’t ask where he was going. He probably knew.

The galley still had the ghost of the ginger tea Clarissa drank to soothe her stomach, but neither she nor Amos was there now. The food dispenser showed their supply levels, and he saw them without really seeing them. He’d lived on the *Rocinante* longer than anyplace else in his life. He knew the ship better than he knew himself.

As he walked down the corridor to their room, he tried to shrug off the bitterness and the anger. The sense of guilt that was rising in his throat. Even so, he knew she’d see it.

Naomi was in the crash couch, her arm thrown over her eyes, but her breath didn’t have the deepness of sleep. Her nap was already over or else it hadn’t yet begun. She smiled, and the deep lines at the sides of her mouth were beautiful.

“How bad is it?” she asked even before she took her arm away.

Holden took a deep breath and let it hiss out through his teeth. His gut didn’t loosen, but it did shift. The anger turned toward something deeper. Grief, maybe. He crossed his arms. She shifted to look at him. The gray at her temples had started appearing a few years ago, and was slowly spreading. There were lines at the corners of her eyes that the antiaging meds they all took now weren’t going to rub away. They were beautiful, too.

“I think it may be time for us to do something else,” he said. “For me to do something else, anyway.”

She shifted, the crash couch moving to adjust to her. If there had been a joke waiting, an impulse to lighten the moment, it died when she looked at him. Seeing her reacting to him told him how serious he really was. How bad he looked.

“Walk me through it,” she said.

He gave her the basics—what Drummer had said, what he and Alex had talked about, what sense he’d made of it—and with every word, every phrase, he felt a confusion he hadn’t known he was suffering start to clear. Just saying it to her, knowing that even if he got the words or thoughts wrong, she would hear the meaning underneath them, let him find his own clarity. The tightness in his gut didn’t go away.

“When we were hunting down pirates, I could accept their surrender,” he said. “Even the Free Navy could have set down arms and we’d have arrested them. But now I’m working for a bureaucratic system that’s willing to kill people as a matter of policy. I don’t feel like I’m enforcing rules, I feel like an executioner, and ... I don’t think I can do it.”

Naomi shifted, making room for him on the crash couch. He lay down beside her. The couch adjusted to their combined mass. She made a low sound, part hum and part sigh. “Tough to do our jobs, then.”

“These colonies? They’re all dependent on the Transport Union, and maybe they won’t always be. But until they’re self-sustaining, they should have a voice in how the union makes the rules. How it enforces them. They didn’t elect Drummer.”

“They didn’t elect any of them. Walker, Sanjrani, Pa.”

“The others weren’t cutting off trade. Drummer is. And yes, I know. Looking at it, this was probably inevitable. Maybe it’s a miracle it took this long to happen. But now it *has* happened, and ...”

“And when one thing changes, other things change too.”

A voice came from the galley. Bobbie, talking to someone—Alex or Amos or Clarissa. He didn’t hear the response, but Bobbie laughed a little at it. The knot in his gut grew heavier.

“I can put out a press release,” he said, and the words seemed to sink him deeper into the gel. “Get the message out to all the colonies about what Drummer wants to do, why I think it’s wrong. Try to lead some kind of ... I don’t know, reform coalition. Maybe talk to the Association of Worlds, see if they want to take it on.”

“Big fight to pick,” Naomi said, neither approving nor disapproving. Just saying it because it was true.

“It’ll mean grounding the *Roci* or keeping to one system for a while. There’s a lot of trade between Earth and Mars, still. Ganymede. Ceres. Maybe there are some colony worlds with enough infrastructure in place that we could find a niche there. Or make one. Or I could tell a few people what’s going on—”

“They already know,” Naomi said. “Drummer sent us out here to make a statement. Everyone’s already watching. Nothing you’ve said isn’t already on news and discussion feeds all around the colonies.”

“So maybe I could let someone else take point on this battle,” he said, closing his eyes. “Just get some in-system contracts and see what happens.

It's important. But ... I don't know. But I'm tired. Too tired to fight this one."

"Or."

He opened his eyes, turned to his side. Her head was tilted the way it was when she hid behind her hair, only without the hiding. Her mouth tensed. Her eyes met his.

"You remember when we first got the *Roci*?" she said. "We were on the run from, oh, I think everyone? Flying this stolen ship. You asked if we wanted to sell her, split the money, and all of us take an early retirement."

He chuckled. "She was worth more back then."

"'Retirement' meant more years back then too," she said. She wasn't laughing. "What if this isn't a decision you need to make for everyone?"

"Meaning?"

"We both know Alex's going to die in that pilot's chair. Bobbie's at home here. Clarissa's health isn't great. And I don't know, but if she decides to try a skilled-nursing facility on Ceres or something, I get the feeling Amos may go with her."

Holden let that idea sink in. He didn't understand the bond between Amos and Clarissa except that it was fierce and platonic and had lasted through years. If it was love, it didn't look like any version he'd ever experienced, but it didn't look like anything else either. He ran his mind over the idea of Amos still on the *Rocinante* without Clarissa. He'd never considered it before. It was a melancholy prospect.

"Yeah, maybe," Holden said. Then, a moment later, "Yeah."

"We're getting up to the same age Fred was when he stroked out on a burn. And you've been on daily anticancer meds for more than half of your life now. It doesn't matter how good they are, that's going to take a toll on your system. Leave you a little more fragile. So the other thing we can do? Sell our shares. Head down to Titan, pick a resort, and enjoy our retirement."

No, Holden thought. No, I will never leave this place and these people. This is my home, and no matter what the dangers and threats and fights are, I will stand this ground. This is where I belong. Where we all belong.

Only what came spilling out of his mouth was "God, that sounds wonderful. Let's do that."

Naomi leaned forward, her brows furrowed. "Really? Because I've got a half dozen other arguments I've been working on for why it's not a terrible

idea.”

“Oh yeah, hold on to those,” Holden said. “I’m going to flip my opinion back and forth for weeks. But right now, living in a dome on Titan with you sounds like the single best idea anyone has ever had.”

“You wouldn’t feel like it made you less of a man?”

“Nope.”

“That you were letting the universe down by not taking on every fight there was? Because I worked on that one for a while. I’ve got some good lines practiced up.”

“Keep ’em,” Holden said. “You’ll need them later. But right now, I’m sold.”

Her face relaxed. He could still see the woman she’d been when they were on the *Canterbury*. Time and age, sorrow and laughter had taken some of the curve out of her cheek, left her skin a little looser at her neck. They weren’t young anymore. Maybe you could only really see that someone was beautiful when they’d grown into themselves. He moved to kiss her—

—and drifted off the crash couch.

With the thrust suddenly cut, leaning up had pushed him into the cabin, twisting as he floated. He reached back with his foot automatically, trying to hook it into one of the holds, but the ship was flipping, so it took a couple tries. Naomi had already braced herself on the frame of the crash couch.

“Well,” Holden said. “I guess Drummer changed her mind about letting Houston come to Medina. That’s disappointing.”

“Weird that Alex wouldn’t sound the alert first, though,” Naomi said, and then tapped her system console. “Alex? Everything all right?”

“I was about to ask you,” the pilot said through the speaker. “We have a change of plan?”

Holden pulled his hand terminal out of his pocket. “Amos? Did you just do a flip-and-burn?”

“Hey, Cap,” Amos’ real voice said behind him as the big man floated into the doorframe. “Wasn’t me. We got something going on?”

A chill ran down Holden’s back that had nothing to do with temperature. Naomi was already on it, querying the *Roci*’s logs and control systems, but Clarissa’s voice came from the speaker before she could find anything.

“I received an alert from the air recyclers,” she said, her reedy voice stronger than usual. “It got a manual command from engineering to drop oxygen output to zero and flood nitrogen.”

“That’s not good,” Holden said. “We shouldn’t do that.”

“I had an aftermarket override in place. No one changes my environmental settings without my say-so,” Clarissa said, as calmly as if she didn’t mean, *My paranoia just saved our lives*. “I’d like to know what’s going on, though.”

“Engineering, the machine shop, and the reactor are all locked down,” Naomi said, scrolling through system screens faster than Holden could follow. “I think I’ve got the drive shut down, but I can’t—”

But Holden was already pulling himself out of the room. Amos hauled himself flat against the wall of the corridor as he flew past, then followed along behind him. Through the galley, to the lift, then down one level. His heart was tripping over, the pulse tapping at his eardrums, but it was just adrenaline. Just fear. There wasn’t anything wrong with the air.

He hoped that was true.

The brig wasn’t really a brig so much as one of the crew cabins that had been set aside, the door controls isolated from the system and disabled on the inside. Over the years, nearly a dozen prisoners had spent days or weeks or months in it. Now the door stood halfway open, the control panel flickering and throwing error codes. Holden pulled himself toward it cautiously—doors and corners were where they got you—but when he reached it, he was already sure what he’d find.

The cabin stood empty apart from bits of floating debris. Anti-spalling cloth floated in ribbons. Bits of fluff from the mattress, like February snowflakes that never fell. Bright lines showed where the storage drawer had been pried off its runners and a length of the guide pulled free. A wall screen floated beside the bunk, and the exposed electronics showed where the door locks had been shorted out.

The governor of Freehold was nowhere to be seen.

“Well,” Amos said. “That’s new.”

Chapter Seven: Bobbie

There was a certain luxury to the thrust gravity of steady acceleration. Hooking your nethers to a vacuum toilet was one of the indignities space travel occasionally forced you into. On the float, with nothing to pull your waste away, it was that or have pee globes sharing your living space. Being able to just sit on a toilet in the crew head and relax for a moment while you did your business was something to appreciate. The fact that it felt like a luxury was also probably not very dignified, if you looked at it too closely.

Bobbie was just reaching behind her for the cleaning-pad dispenser mounted on the bulkhead when the gravity went off with no warning. The momentum of her twisting torso sent her floating off the toilet seat and into the air, pants still around her knees. Thankfully, the *Roci* immediately fired up the vacuum system on the toilet and spared her having to dodge floating waste.

While she tumbled through the air tugging at her waistband, she yelled, “*Roci*, get me the bridge!”

“Yo,” Alex replied almost immediately. “Where are you—”

“Not even a fucking warning light? I’m down in the head, taking a leak, and suddenly I’m trying to pull my pants up on the float!”

“Wasn’t my plan,” Alex said. “Looks like ... Ah. Hold on.”

The system link picked up Naomi’s voice coming through a different channel. *Alex? Everything all right?*

“I was about to ask you,” Alex said. “We have a change of plan? Naomi? Um, Bobbie? I think we may have a situation.”

All it took was the tone of Alex’s voice. Bobbie planted one foot against a bulkhead, hooked a handhold with the other, and yanked up her pants.

“Copy that,” she said, the flat, emotionless tones of the old Marine taking over. “On the move.”

She found Holden and Amos floating just inside the door of their makeshift brig when she arrived. They were examining a wall screen that

someone had pried out of the wall. The prisoner wasn't there.

"How long has he been out?" Bobbie asked as she came to a stop with one hand on the doorframe.

"*Roci* started throwing errors from this door almost an hour ago," Amos said with a grimace. "This is on me, Cap. Shoulda been paying attention, but I was—"

"Forget it," Holden said. "Let's just keep him from doing any more damage."

"He's down in engineering, if he was able to kill the drive and spin the ship," Bobbie said.

"That's where he is," Holden said. "Naomi's working to keep him from making too big a mess, but she's working remotely, and this guy has demonstrated surprising technical skills."

"Options?" Bobbie asked. The tactical situation wasn't optimal. If the prisoner was locked in engineering and had also managed to seal off the machine shop above it, then they'd need to cut or breach two doors just to get to him. Even with Naomi hacking the control systems, physical proximity to the reactor gave Houston options she just didn't have. And Bobbie didn't like him having.

Holden drummed his fingers on his leg for a moment, the movement imparting an almost imperceptible spin to him as he floated.

"If he feels like he has no way out, he might blow the reactor out of spite," Holden said, mirroring Bobbie's own thoughts. "So a standard breach has to be last choice. Amos, you're in charge of that. Have Clarissa help you hotwire the door sensor to the machine shop so you can cut it without Houston knowing. Then put a mining charge on the door to engineering and wait for my signal."

"Got it," Amos said and pushed off down the corridor. He already had his terminal out, and was saying, "Peaches? Meet me at the machine shop hatch ..."

"If I'm not breaching, then—" Bobbie started, but Holden cut her off with a shake of his head.

"I want you using the aft maintenance hatch. You can come in from behind. Keep us from doing a very risky breach."

"Okay," Bobbie said, stretching the word out. "But, that access is unusable with the drive on."

"Naomi will make sure it stays off."

“And if she doesn’t.”

“You’ll get cooked,” Holden said with a nod. “But we’re playing against the clock here. We don’t know how long we’ve got until Houston decides dying in a fireball is more romantic than jail.”

“Betsy won’t fit into that tight maintenance crawl.”

“No, she won’t,” Holden agreed. “Pretty sure you can still kick this guy’s ass, though.”

“Not in doubt.”

“Then gear up, Marine. You’re going outside.”

Bobbie wasn’t really much of a ship mechanic, but she knew how to turn a wrench or draw a straight bead with a welding torch. Over her last couple decades of making the *Rocinante* her home she’d spent a fair amount of time outside the ship. Sometimes with Amos, who called her Babs for a reason only he understood, and who often assumed she knew what she was doing even when she didn’t. Sometimes with Clarissa, who occasionally slipped and called her Roberta, and who explained every procedure in the exhaustive detail you’d use with someone who knew nothing.

And, almost without her knowing it, they’d become her family. She still had brothers and nieces and nephews back on Mars related to her by blood, but she rarely spoke to them. Even then it was always in a recorded message fired across space on the end of a laser. Instead, she had Amos, the gruff big brother who’d let her fuck up on a repair job and just laugh at her, but then fix it later and never mention it again. And she had Clarissa, the annoying know-it-all little sister who wrapped herself in rules and procedure lists and formality like a shell around her fragile center.

And then Holden and Naomi, who couldn’t help but become the parents of the ship. Alex, the best friend she’d ever had, and the person she’d realized recently she had every intention of growing old with, in spite of never having seen him naked. It was an odd group of people to fall in love with, to adopt as your own kin and tribe, but there it was, and she wasn’t ever going back.

And now Payne Houston was threatening them.

“You fucked up, man,” she said to herself as she drifted to a stop over

the reactor-bay emergency-access panel. “You just fucked all the way up.”

“Repeat?” Alex said quietly in her ear. Bobbie realized she’d left the channel open and the volume low as she’d made the climb down from the crew airlock to the rear of the ship.

“Nothing,” she said, turning the volume back up. “I’m in position.”

“Patching you back into the master channel,” Alex replied, and then suddenly there were half a dozen voices breathing in her ear.

“Sound off,” Holden said.

“We got through the machine shop door okay, and Peaches says no alerts were triggered. Breaching charge is ready. Just call it.” Amos’ voice, calm and faintly amused. He could have been reporting football scores.

“I’ve got the *Roci* in diagnostic mode, so she’s asking me to verify any orders coming from the engineering console,” Naomi’s voice said. “But that can’t last. Pretty soon he can just start breaking things the old-fashioned way.”

“Draper here. I’m outside the emergency-access hatch.”

“How long once that door opens?”

Bobbie ran through the layout in her head. It was an old habit, beaten into her by years of training in the toughest military outfit humanity had ever created. Plan it through before you go in, because once the bullets start flying, the time for thinking is over. All you can do is move and react.

“Fifteen seconds to cycle the hatch closed. A few seconds to squeeze past the reactor housing; it’s a tight fit. But a good thirty seconds to equalize the pressure, so that’s our speed bump. Once the atmo in the crawlspace is equalized, I can be through that inner hatch in less than five.”

“Naomi? Can you keep our guest out of the controls for the next minute so we don’t cook our only good Martian?”

“Hey, Cap, that’s low,” Alex said with a laugh. Bobbie found it reassuring and terrifying that they could joke at a time like this.

“Bobbie,” Naomi’s voice said, gentle but firm. “No way he gets that reactor on while I’m alive.”

“Copy that. Draper is a go on your mark.”

Holden simply said, “Okay.”

The hatch in front of her vibrated under the palm of her vacuum suit’s glove as Naomi cycled it open. A faint puff of vapor escaped as the hatch popped open. Bobbie pulled herself inside, squeezing into the curved space between the inner hull of the ship and the outer shielding of the *Roci*’s

reactor core. The hatch began to cycle closed behind her.

“Governor Houston,” Holden said over the radio. “I’m sending this over the 1MC so I know you can hear me. It won’t compromise your position at all to at least open a dialogue.”

Bobbie pulled herself around the curve of the reactor to the inner hatch. The panel glowed red with the lock symbol, and the status read, NEG ATMOSPHERE. The timer in her HUD showed only ten seconds had elapsed, so the outer door wasn’t even finished cycling. Almost forty seconds, then, before she could pop the inner hatch and go kick this Houston’s ass up one side of the ship and down the other. She pulled the heavy recoilless pistol from the harness on her chest and double-checked the ammo counter. Ten self-propelled high-explosive antipersonnel rounds. If Houston forced her to shoot him, they’d be cleaning up red stains for a month.

Bobbie had served on ships most of her life. She wasn’t scared of a little mopping.

“Come on, man,” Holden said. “At this point, we can keep you from doing just about anything. Sooner or later, you’ll need a snack.”

To her surprise, Houston’s voice answered. “Naw. Found your mechanic’s beer fridge down here. Had a big bag of sesame sticks in it. Jalapeño-flavored. Bit spicy for me, but still tasty.”

“Better not be drinking my fucking beer,” Amos said in that same nonchalant voice.

“Anyway,” Holden cut in, “we still have a situation. You’re not going to be able to take the ship, and I’d really like to start using it again. How do we come to some sort of agreement?”

Bobbie heard the first hiss of the atmosphere system outside her suit. The pressurization was almost done. She held the pistol in her right hand and gripped the door with her left. The second it showed green, she’d be in the room with that asshole.

The asshole said, “I don’t know that we do. You’re right. I can’t get past that diagnostic lockdown. That was smart work, by the way. But I figure I can probably get the reactor back online from in here, and then I figure I can collapse the bottle if I just find the right wires to pull. You figure the same way?”

“Well,” Holden started, but the light on the inner hatch clicked green and Bobbie yanked it open.

The main console for the reactor would be to her left as she entered the

compartment. It was likely that Houston was using that workstation, so that was her first target. If she pushed off hard, she'd come out of the small hatch like a missile, do a quick flip to land feetfirst on the opposite bulkhead. From there she'd have open sight lines to the entire engineering deck. Nowhere for Houston to hide.

Bobbie gripped the edge of the hatch and pulled with all her strength to launch herself into the room. She had to—

Something crashed into the side of her helmet and sent her into a flat spin through the air. She tried to get her hands up to keep from crashing facefirst into the bulkhead, and only half succeeded. Her left arm crumpled under her, and she felt something tear with a wet heat in her shoulder. She bounced off the wall and saw Houston standing on the bulkhead above the access hatch, mag-booted in place, and holding a heavy fire extinguisher with a dent in the bottom.

Miraculously, the gun was still in her hand. Blackness creeping in at the edge of her vision, Bobbie tried to line up a shot. Houston launched himself off the wall with one strong kick and brought the extinguisher down on her hand in a baseball-bat-style swing. She felt two of her fingers break, and the gun and extinguisher flew off in opposite directions across the room.

The deck seemed to swim up to meet her. She caught a glimpse of Houston spinning off toward the ceiling. She managed to turn on the mags in her glove and pull herself down long enough to get her boots locked onto the deck plating. If this was going hand-to-hand, she'd want leverage, and that meant planting her feet. She turned the boots' mags almost up to full, and watched Houston catch himself on the ceiling.

She spread her arms wide, though from the tearing sensation in her left shoulder, she didn't think that one was going to be much use. And the broken fingers in her right hand made grappling or throwing a punch problematic.

"You're lucky you're wearing that suit," Houston said, gulping to catch his breath. "I put a dent in that helmet woulda knocked your brains out without it."

"And you," Bobbie said, "are very lucky it's *this* suit. I've got another one."

"Well. We gonna talk or are we gonna dance?"

"They're playing my—" Bobbie started, then Houston launched himself off the ceiling straight at her. She was expecting it. Getting someone else to

talk while you threw a punch was an old trick. The moment he left the bulkhead above her, she was already shifting her body to the left and rotating through her hips. As Houston sailed past, she brought her right elbow into his chin.

Houston's teeth slammed shut with a crunch that meant he'd cracked a few, then his whole body cartwheeled past her and into the wall with a thud. She kicked her mags off and pushed over to him, wrapping her right arm around his neck for a choke hold. It was unnecessary. His eyes were rolled up in his head, and he was breathing blood bubbles out of his ruined mouth. One and done. Just like the old days.

"I put our guest to bed," Bobbie said over the radio, then hauled Houston over to the wall panel and removed the locks on the hatch. "Amos, take that bomb off the door before I open it, 'K?"

Bobbie sat in the galley, her left arm in a sling, and her right hand in a cast that the ship had spun for her out of carbon fiber. Holden sat across from her, a steaming cup of coffee on the table held down by the gentle 0.3 g Alex was flying them at.

"So," Holden said, then paused to blow across the top of his coffee. "Turns out that guy had a few more skills than I clocked him for. Thanks for saving my ship."

"I kind of feel like it's mine, too," she said with a smile. Holden was Holden. He'd need to take the weight for every bad thing that happened, and to overstate his appreciation for the good ones. It's what made him *him*. He projected selfless heroism on everyone because that's what he wanted to see in people. It was the same thing that caused most of the problems in his life—most people weren't who he wanted them to be—but this was a nice moment. Ship safe. No one dead. Not even Houston, though if someone didn't keep an eye on Amos, that might change.

"So it's funny you should say that," Holden said. He'd paused over his coffee long enough that she'd sort of forgotten what she said. "Would you like to buy the ship from me?"

"I—" Bobbie started, then, "Wait, what?"

"Naomi and I are thinking of pulling the ripcord. We've been doing this

shit for a lot of years. It's time to find a quiet spot somewhere. See how we like that for a while."

It was more of a hit than anything Houston had managed. The ache started just below her ribs and spread up. She didn't know what it meant yet.

"Is everyone else on the crew ...?" Bobbie said, then wasn't sure how to finish the sentence.

"No. As Naomi recently pointed out to me, Alex will die in that pilot's chair. Whoever buys the ship will have to be okay with that. I can't speak for what Amos plans to do, you know, after."

After. He meant after Clarissa died.

"I've been saving my money, mostly, but I'm not sure I can afford a gunship," Bobbie said, keeping her tone light, trying to make a joke of it.

"We'll finance it. Split the joint account six ways, then set up a payment plan for the rest. Based on our past income, it should be an easy nut to cover. You pay any new crew out of your end. The *Roci* is your ship."

"Why me? Why not Alex?"

"Because there isn't anyone on this ship *I'd* rather take orders from, and I'm the world's worst person at taking orders. You'll make a fantastic captain, and you'll protect the reputation of this ship. It's weird, but that's something I find myself caring about."

Bobbie swallowed something that had become stuck in her throat, and she straightened up her back. It was all she could do to not stand up at attention. Military tradition died hard, and a captain handing over command of their vessel bordered on sacred trust.

"I would, you know," she said. "I'd see us become a cloud of gas before I'd violate the honor and good name of this ship."

"I know. So is that a yes?"

"I do wonder ..." Bobbie said.

Holden nodded and drank his coffee, waiting for her to finish.

"I wonder what the universe looks like without James Holden trying to ride to the rescue."

"I imagine everyone will find things running a lot more smoothly," Holden said with a grin.

"I wonder," Bobbie repeated.

Chapter Eight: Singh

Singh was dreaming of wandering, lost in the halls of a vast spaceship, when the comm on his desk buzzed him awake.

“Yes?” he croaked even before he’d opened his eyes. There was nothing wrong with his taking a nap in his quarters. He wasn’t shirking any of his duties. And the shakedown of his ship, the *Gathering Storm*, had meant working for sixteen and sometimes eighteen hours a day for weeks now. He couldn’t continue as an effective leader and officer if he didn’t take every opportunity to grab a little shut-eye.

And yet, something inside him didn’t want his crew to know. As if having the same biological requirements as other humans was admitting weakness.

“Sir, we are nearing rendezvous with the *Heart of the Tempest*,” came the reply. Lieutenant Trina Pilau, his navigation officer. “You asked me to —”

“Yes, yes, quite right. I’m on my way,” Santiago said as he rolled out of his couch and waved on the lights.

His quarters were also his office, and the red folder containing his orders from the admiralty was still sitting on his desk. He’d been reviewing them for the fiftieth time or so when he’d fallen asleep. Leaving them out was a breach of operational security, and one he’d have reprimanded a junior officer for. As he returned them to his safe, he told the ship to make a note of the lapse in his private log. At least it would be part of the permanent record, and his superiors could decide later if it required further inquiry. He hoped they wouldn’t.

He took a moment to wash his face in his private lavatory. The cold, biting water was one of the perks of his station. He put on a fresh uniform. A captain set the standard for his officers. Appearing on duty clean and pressed was the minimum level of professionalism he expected from them, and so he was responsible for it in himself. When he was presentable, he

opened the door that separated his private space from the bridge of the ship.

“Captain on the bridge!” the chief of the watch snapped. The officers who were not actively manning stations stood and saluted. Even the consoles, polished to a spotless shine, seemed to radiate respect, if not for him as a man then at least for his authority. The blue of the wall matched the flag, and the sigil of his command—three interlocking triangles—had been built into the surface. It made him feel a deep, almost atavistic pride seeing it. His ship. His command. His duty.

“Is Colonel Tanaka here?” Singh asked.

“The colonel is in her briefing room with her senior officers, sir.”

A twitch of annoyance troubled him, as much with himself as with his chief of security. He’d meant to have a quiet conversation with her before meeting with Admiral Trejo. He’d heard unofficially that Tanaka and Trejo had known each other before, and he’d intended to get her assessment of the man. But it was too late for that now.

“The con is yours,” said Davenport, his executive officer.

“I have the con,” Captain Singh said, and sat in his chair.

“The *Tempest* has cut thrust and is awaiting our arrival,” his flight control officer said, pulling up the range map on the main screen. “At current deceleration we’ll make final docking approach in twenty-three minutes.”

“Understood,” Singh replied. “Comm, please send Admiral Trejo my compliments and request permission to dock with *Heart of the Tempest*.”

“Aye, sir.”

“I’d love to get a good look at her,” said Davenport.

“All right, let’s take a peek,” Singh agreed with a nod.

The truth was, he was just as curious. Of course they’d all been briefed on the configuration of the *Magnetar*-class battle cruisers, of which *Tempest* was the first. The old *Proteus* class had been retired, and this new generation was only now being deployed. He’d seen dozens of concept sketches and photographs of the ships under construction, heard rumors of the new technologies that they would support. This would be his first chance to see one of Laconia’s most powerful battleships flying free and in her element. “Sensors, let’s take a close-up look, shall we?”

“Aye, sir,” said the officer at sensor control, and the main screen shifted from the docking map to a telescopic view of the approaching ship.

Someone let out a quiet gasp. Even Davenport, an officer with nearly a

decade in the fleet, took an unconscious half step back.

“Good God, she’s a big one,” he said.

The *Heart of the Tempest* was one of only three *Magnetar*-class ships to come out of Laconia’s orbital construction platform. The *Eye of the Typhoon* was assigned to the home fleet and the protection of Laconia itself. The *Voice of the Whirlwind* was still being grown between the spars and limbs of the alien orbital arrays. And while the fleet now consisted of over a hundred ships, the *Magnetars* were the largest and most powerful by far. The *Gathering Storm*, his own ship, was one of the *Pulsar*-class fast destroyers, and he was fairly certain the *Tempest* could fit a dozen of them inside its hull.

The *Pulsar*-class destroyers were tall and sleek in design. To Singh’s eye they were almost reminiscent of old Earth naval ships. But the *Heart of the Tempest* was massive and squat. Shaped like a lone vertebra from some long-dead giant the size of a planet. It was as pale as bone too, even where the curves fell into shadow.

Like all ships built by Laconia’s orbiting construction platforms, it had the sense of something not quite human. The sensor arrays and point-defense cannons and rail guns and missile tubes were all there, but hidden under a self-healing plate system that made the surface of the ship seem more like skin than not. Grown, but not biological. There was something fractal about its geometry. Like crystals showing the constraints of their molecular architecture in the unfolding of shapes at higher levels.

Singh wasn’t an expert in the protomolecule or the technologies that it spawned, but there was something eerie in the idea that they’d built things partly designed by a species that had been gone for millennia. Collaboration with the dead left questions that could never be answered. Why did the construction array make the choices it made? Why place the drive here instead of there, why make the internal systems symmetric and the exterior of the ship slightly off? Was it a more efficient design? More aesthetically pleasing to its long-vanished masters? He had no way of being certain, and probably never would.

“*Tempest* acknowledges,” the comm officer said.

“Remote piloting for dock now,” his helm added, and the main screen shifted from telescopic shots of the battleship to a wire frame course ending at the *Tempest*.

“Very well,” Singh said with a smile. The admiralty had entrusted him

with one of Laconia's state-of-the-art ships, and they'd filled it with serious and focused officers and crew. As a first command, he couldn't have asked for better.

That he and his ship were the tip of the imperial spear was just icing on the cake.

"Admiral Trejo sends his compliments," the comm officer said. "He asks that you join him for dinner in his private mess."

Singh turned to his XO. "Stay on the *Storm* and keep the crew alert. We have no idea what reception we're getting on the other side of the gate, and may need to deploy at a moment's notice."

"Aye, Captain."

"Rig for docking. I'll be in the bow-crew airlock. Mister Davenport, you have the con."

The *Tempest's* operations officer, Admiral Trejo's third in command, was waiting for him on the other side of the airlock. Technically they were the same naval rank, but as a ship's captain, tradition dictated that Singh be treated as the superior officer. She saluted and granted him permission to board.

"The admiral would have greeted you personally," she said as she led him out of the airlock and they floated down a short corridor to a lift. The walls in the *Tempest* looked like sheets of frosted glass, and glowed with a gentle blue light. Very different from the bulkheads of the *Gathering Storm*. "But this close to the gate he doesn't like to leave the bridge."

"Fisher, right? I think you were a year behind me at the academy."

"I was," she replied with a nod. "Engineering track. Everyone said logistics was the faster path to command, but I just love working with exotic tech."

She stopped and tapped on the wall panel to call a lift. While they waited, the bulkheads began to pulse from blue to yellow.

"Grab a handhold," Fisher said, pointing to one close by. "Drive is about to come online."

A moment later they both drifted to the deck, and Singh felt his weight grow until it was about half a g.

“Not in a hurry,” Singh said, and the elevator made a gentle beep and the doors opened.

“The admiral’s a cautious man.”

“Speaks well of him,” he said as they began to rise.

Admiral Trejo was a short, stocky man, with bright-green eyes and thinning black hair. He came from the Mariner Valley region of Mars, but the traces of his accent were almost imperceptible. He was also the most decorated officer in Laconia’s military, with a career that stretched back to pirate hunting for the Martian Navy even before the gates opened. They studied his tactics in the academy, and Singh thought the term *military genius* was justifiably applied to his career.

He’d expected the private mess of an admiral and fleet commander to be larger, more luxurious than the one he claimed on the *Gathering Storm*. It turned out to be a table that pulled down from one bulkhead in Admiral Trejo’s slightly larger office/living quarters. The aesthetics were different only because the ship itself was.

“Sonny!” Trejo said, waiting to return his salute and then grabbing his hand and shaking it vigorously. “Finally all the pieces are in place. It’s an exciting time. Would you like to sit, or do you want the tour?”

“Admiral,” Singh replied. “If there’s a tour to be had, I’d be honored to see a little more of the ship.”

“She’s a sight, isn’t she? Call me Anton, please. No need for formality in private, and we’ll be working very closely together in the coming months. I want you to feel like you have complete freedom to speak your mind. An officer who won’t share his opinion and insight is of no use to me.”

It was an echo of the high consul allowing him to use his military title, the permission of a little familiarity in private to build a sense of approachability and rapport. Now that he’d seen it twice, he understood it would be expected of him as well.

“Thank you, sir. Anton. I appreciate that.”

“Come on along, then. It’s too large to take in all at once, but we can hit the highlights.” Admiral Trejo led the way down a short corridor to a lift that stood wider than the one on the *Gathering Storm*, with rounder edges that left Singh thinking of the mouth of some deep-sea fish. “I’ve been re-familiarizing myself with your career to date.”

“I’m afraid that, like most of the officers trained after the transition to Laconia, I have very little in the way of operational experience.”

The admiral waved this away. The lift door opened, and they stepped in. The anti-spalling padding on the walls was gently scalloped, like the presentiment of scales.

“Top of your class in logistics. That’s exactly what this posting will need. Me? I’m an old combat commander. Spreadsheets give me hives.”

The lift descended with a hushing sound like a million tiny bearings spinning at once, or the hiss of a sunbird. The small hairs on the back of Singh’s neck rose a little. There was something uncanny about the *Tempest*. Like he’d entered into a vast animal and was waiting to see its teeth.

“Yes, sir,” he said. “My orders were quite specific on—”

The admiral waved him off again. “Forget your orders for a moment. Plenty of time to get to that later. For now, I want to get to know you a little better. You have a family?”

Another point. Duarte had touched on his home life as well. Another piece of the secret teachings of Laconian command. He’d read that a command structure took its tone from those at the top. He’d never seen it so clearly in practice before. He wondered whether he’d been meant to. If this was a conscious lesson passed from Duarte to Trejo to him. He had the sense that it was.

“Yes, sir. My spouse is a nanotech scientist with the lab in Laconia City. She specializes in genetics. We have one child. Elsa.”

“Elsa. Unusual name. Very pretty.”

“My grandmother’s. Nat— Natalia, my spouse, insisted.”

The lift stopped. The doors opened on a wide and flowing deck. There were no stairs, but a gentle undulation in the deck raised some workstations above others. It seemed almost random until he saw the captain’s station that could command direct line of sight to all the flight-deck crew at once. The design was elegant and utterly unfamiliar at the same time.

The XO caught sight of them and stood at attention, surrendering command, but Trejo waved him back. The admiral was present, but not to take command.

“Connection to the past is important,” Trejo said as they walked across the gently sloping deck. “Continuity. We honor those who came before, and hope that those we bring into the world do the same for us.”

“Yes, sir.”

“Anton, please.”

“Anton,” Singh agreed, but knew calling the admiral by his first name

would never feel natural or correct. “We almost never call her Elsa.”

“So what, if not Elsa?” the admiral asked.

“Monster. We call her Monster.”

The admiral chuckled. “Named for another grandparent?”

“No,” Singh said, then stopped. He worried that he might be oversharing, but the admiral was staring at him, waiting for the rest of the answer. “We were not really ready when Nat got pregnant. She was just finishing her postdoc, and I was doing two- and three-month patrol tours as the XO on the *Cleo*.”

“No one is ever ready,” the admiral said. “But you don’t know that until after it’s happened.”

“Yes. So when Elsa was born, I’d just rotated back to an administrative position, and Nat had moved to a more permanent research job, and we were both learning the ropes while a very insistent one-month-old made her demands.”

Trejo led the way down a curving ramp at the side of the room. Hatches irised open as they approached them and closed again once they’d passed. The light came from thumb-sized recesses in the wall, perfectly regular in their spacing, but rounded and soft. Organic life subjected to military engineering.

“So,” Singh continued as they walked, “we were exhausted. And one morning, at about three when Elsa started crying, Nat rolled over to me and said, ‘That monster is going to kill me.’ And that was it. She was Monster from then on.”

“But you say it with a smile now, yes?”

“Yes,” Singh agreed, thinking of his daughter’s face. “Yes, we do. And that’s why I’m here.”

“Why you’re here, hm? You don’t seem like the type of man who’d choose to go without his family.”

“It will hurt to leave them behind for this deployment. It will be months, at least, before they can join me on Medina Station. Possibly years. But if I can give my daughter the version of humanity that the high consul has planned, it will all be worth it. A galactic society of peace and prosperity and cooperation is the best legacy I can imagine for her.”

“A true believer,” the admiral said, and Singh felt a flush of shame that perhaps he appeared naïve to the man. But when Trejo continued, there was nothing mocking in his tone. “This will only work because of the true

believers.”

“Yes, sir,” he said. And then, “Anton.”

The admiral led the way into a broad corridor, larger than anything he’d ever seen designed in a ship. The *Tempest* didn’t have the closeness of other ships, the design constrained by the need to cut back every kilogram, to waste no space at all. It was a ship that claimed power by the shape of its walls. Singh felt a little awe at it. As he supposed he was meant to.

Two midshipmen sat at a table, laughing and flirting until they saw Trejo. The old man scowled, and the pair saluted and scurried off to their duties. Singh realized that no one had spoken to them in the time since they’d left the admiral’s cabin. The tour might seem casual, but it was intended to be private as well.

In the same tone of voice one might use to ask what the time was, the admiral said, “Explain to me the tactical and logistical problems with controlling Medina.”

Singh stood a little straighter. Comfortable discussions of family were over. Now it was time to work. He pushed his sleeve back a bit to pull the monitor off his wrist, and flattened it onto the abandoned table. He pulled up the briefing. He’d been preparing it for weeks, and the sudden, irrational fear that he’d overlooked something obvious, something that would show the admiral that he wasn’t a serious person after all, still lurked in him. It was an old, familiar kind of fear, and he knew how to push it aside. A wire frame rendering of Medina floated in the air above the surface.

“Medina Station,” Singh said. “Assuming our intelligence is correct, it houses the hundreds of members of the planetary coalition and their personal staffs, including security. Add in the permanent staff and crew of the station, as well as trade union members passing through, and you get a conservative estimate of between three and five thousand people on the station at all times. I would guess the number is actually double that.”

“Assuming our intelligence is correct?”

“Passive monitoring, even over the course of years, will always have a greater opportunity for error than active examination. And the surface interference of the gates adds an additional level of error,” Singh said. The admiral grunted and waved him to continue. He spun the rendering of the station, and hard points on the surface became highlighted in red.

“The station itself is equipped with some defenses. A PDC network that provides missile defense brackets the station, and one torpedo launcher

remains intact and usable from its *Behemoth* days. Eight rails, automated reloading system, we estimate a total capacity of forty missiles.”

“Nuclear?” the admiral asked.

“Almost certainly not. The lack of maneuvering capability and the confined nature of the ring hub makes high-yield weapons dangerous to the station itself.”

Singh adjusted the image and focused in on the hub station, a perfect sphere several kilometers across that sat at the center of the gate network. The purest and most active alien artifact in all the worlds they knew of. Dotted on the surface of the sphere were six massive rail-gun turrets.

“The station’s primary defense is an aging rail-gun network, first installed by Marco Inaros’ people, and disabled during the final conflict with his faction. These guns are placed so that at least three guns and as many as five can fire at any of the rings. They’re our design, from back when we were still supplying the Free Navy with weapons. Older, out of date now, but capable of sustained fire at thirty rounds per minute. Assuming, of course, that they haven’t made modifications to them.”

“The rail guns. In the ancient days back on Earth, they’d have cannons that could fire down into the harbors when enemy ships appeared. The defense of the sea from the land. We got rid of the land and the sea, but the logic of it stays the same. The more things change, eh?”

“Yes, sir.”

“What do you think of them?” Trejo asked.

“The design is elegant. Placing the defense battery on the alien station is brilliant,” Singh said. He felt anxiety growing in his throat. Was this the answer Trejo was looking for? “Anyplace else, and the rail guns would have to compensate with thrusters. The station doesn’t move. Or maybe it moves and drags its entire local context with it. Either way, it avoids having to worry about Newton’s third law. And as long as it has ammunition, it can hold off attacks from any of the rings, or even several at once. Honestly, I’m going to be sorry to see it go.”

Trejo sighed. “Rebuilding them won’t be quick, that’s true. But we have to look at the long term. Even if a replacement battery takes months to install and test, it will last centuries. I wish we could take control of them ourselves. But that’s the *Tempest*’s first target, while you disable the station’s defenses. Then board and secure the station,” the admiral said.

“Yes, sir. Logistically, once the station’s defenses are secured and the

rail-gun network is taken offline, the *Gathering Storm's* Marines, which we've designated Task Force Rhino, can take operational control of the station within minutes. When we control their comm array and access to the hub space, we effectively control all communications and trade for the thirteen hundred worlds."

"You'll have operational control of the landing and securing Medina Station. Is the task force prepared?"

"Yes, Admiral. They've been drilling for this assignment for months, and my security chief is Colonel Tanaka. She is well respected."

"Tanaka's good. And good personnel are critical," Trejo said. "What obstacles do you anticipate?"

"The ship traffic coming into and out from the hub space is unpredictable. It's very likely that there will be one or more additional ships with some defensive capability beyond the use of drive plumes as weapons. How many and what their armaments are can't be stated with certainty until we pass through the gate. Also, Medina Station has been in operation for decades, and with a mission significantly different from her original design. The information we have about the initial configuration will be badly out of date. When we take control, there is the possibility of some local resistance, though that should be minimal. After that, it's a question of co-opting and improving the existing infrastructure, and coordinating the supply chains between the newer planets and the better established ones. Sol system included."

"And then you fly a desk for a while," the admiral said. "I'd have to think that's the toughest part of your assignment. Getting thirteen hundred squabbling children to cooperate."

"High Consul Duarte wrote the book on governmental trade-control theories, back when he was with the Martian Navy. It's still the book we study at the academy. I'm prepared to enforce the new orders absolutely to the letter."

"I'm sure you are. Duarte has an eye for talent, and he selected you personally," the admiral said, then pointed at the briefing diagrams floating in the air between them. "And you certainly seem to have done your homework."

"Yes, sir," Singh said, then cleared his throat. "If I may speak freely, sir?"

"I think I already made my feelings on that clear."

“Yes, sir,” Singh said, but the anxiety still tugged at him. “I’m absolutely certain of this portion of our plan. My worry is the Sol system. Intelligence says that the Earth-Mars Coalition has been steadily refitting and rebuilding their fleet. And that it is at least at the prewar levels of preparedness. When external resistance to our plan comes, it will come from them. And while we have newer ships, they have the benefit of an officer corps that fought in two serious wars in the last few decades. They will have vastly more battlefield experience to draw on.”

The admiral paused, considering him. The bright-green eyes seemed to dig under his skin. Singh couldn’t tell if the man was pleased or disappointed. When he smiled, it seemed genuine.

“Experience and home territory are real advantages for them, you’re right. But I think you shouldn’t worry about it overmuch,” the admiral said. “The *Tempest* was built for one purpose, and one purpose only. To render every other power in the known galaxy irrelevant.”

OceanofPDF.com

Chapter Nine: Bobbie

They sat in the galley, the same way they always did. Amos and Clarissa beside each other, Alex at the end of a table across from her. Holden a little apart, and Naomi closer to him than to the others. Bobbie felt the anxiety humming in her throat and legs like she was about to get in a fight. Worse, because there was a moment of calm that came with violence, and there wasn't going to be one of those here.

The dinner was—had been—mushroom noodles in black sauce. But everyone had stopped eating when Holden cleared his throat and said he had an announcement. When he'd broken the news, he'd seemed rueful more than anything else, and he covered it up by talking about numbers and business. Going over their last few years, and the projections for the next few. His decision to step down, and Naomi's too. His nomination of Bobbie to take his place and all his arguments for it. The others listened in silence while he turned to the details of the sale. The noodles had all gone cold and sticky in their bowls.

"Naomi and I are cashing out a quarter of our shares in the ship," he said, "with a payment plan that pays out the remainder over the next ten years. That still leaves a pretty fair balance in the operating account. The payment plan has a sliding structure, so if things get a little tight at some point, we're not going to sink you, and if things go really well, you can also pay us out early. So there's flexibility built in."

He thought he was being kind. That by making things formal, it would hurt the others less. Maybe he was right. Bobbie kept glancing around the room, trying to get a sense of how they were taking it. Was Alex leaning forward on his elbows because he was feeling aggressive, or did his back just ache a little? Did Amos' affable smile mean anything? Did it ever? Would they agree to the idea? If they didn't, what happened then? The anxiety in her gut stung like a scrape.

"So," Holden said. "That's the proposal at least. I know we've always

voted on these kinds of decisions, and if there's anything in this that anyone wants to look at or a counterproposal that anyone wants to make ..."

The silence rang out louder than a bell. Bobbie clenched her fists and released them. Clenched and released. Maybe this whole thing had been a really bad idea from the start. Maybe she should have—

Alex sighed. "Well. Can't say I didn't see it coming, but I'm still a little sad now it's here."

Naomi's smile was a ghost, barely there and unmistakable. Bobbie felt something like the beginning of relief loosening the knot in her stomach.

"As far as putting Bobbie in the captain's chair," Alex went on, "that's barely going to be a change. She already bosses me around plenty. So sure. I'm good with that."

Holden tilted his head the way he did when he was surprised and a little embarrassed, and Naomi put her hand on his shoulder. The unconscious physical grammar of long, intimate years together.

"You saw it coming?" Holden said.

Alex shrugged. "It's not like you're all that subtle. You've been getting more and more stressed for a while now."

"Have I been an asshole and just didn't know?" Holden asked, making it about half a joke.

"We'd have told you," Amos said. "But there's this thing for the last couple years, I guess, where you kept looking like you had an itch you didn't want anybody seeing you scratch."

"This has been a long damned tour," Alex said. "If I'd re-upped for another twenty back in the day, I'd be out again by now."

"Except your navy didn't last that long," Amos said.

"I'm just saying a good run's a good run. I love you two, and I'm going to miss the hell out of you, but if it's time for something new, then it is."

Naomi's smile grew less ambiguous. Holden rocked back a few centimeters on the bench. In her imagination, Bobbie's best scenarios had involved weeping and hugs. The worst, anger and recriminations. This felt like relief only slightly colored by sorrow. It felt ... right.

She cleared her throat. "When we get back to Medina, I'm looking to put out a call for some new hands. So, no rush, but I'm going to need to know if I'm filling more than two couches."

Alex chuckled. "Not mine. The one thing I think my life experience has been unambiguous about is whether I'm good outside a pilot's station. I'm

here as long as you'll have me."

Bobbie relaxed another notch. "Good." She shifted toward Amos.

He shrugged. "All my stuff's here."

"All right. Clarissa?" Claire was looking down. Her face empty and paler than usual. She put her hands on the table, palms down like she was pressing it back into place. Like there was something that could be put back. Her smile was forced, but she nodded. She would stay.

"Well," Holden said. "Um. All right, then. That's ... I mean, I guess that's it. Unless someone else has something they wanted to bring up?"

"Kind of a hard act to follow," Naomi said.

"Well, yes," Holden said, "but I mean—"

"How about this," Alex said, standing up. "I'm going back to my cabin and getting the Scotch I've been saving for a special occasion. Let's all have a toast to Holden and Nagata. Best damn command staff a ship could hope for."

Holden's expression shifted and his eyes took on a shine of tears, but he was grinning. "I won't say no," he said, then stood.

Alex went in for the hug, and then Naomi put her long arms around them both. Bobbie looked over at Amos and pointed a thumb at the knot of three. *Is this a thing we should do?* Amos rose and trundled over to them, and Bobbie followed. For a long time, the crew of the *Rocinante* stood locked together in a long, last embrace. After a few seconds, Bobbie even felt Clarissa against her side, pressing in as soft and fleeting as a moth.

Officially, nothing changed after that. The long float before the deceleration burn toward the gate and Medina Station beyond it went the way they'd planned it. Houston, in his cell, was sullen and uncomfortable but secured. Their duties and schedules, habits and customs, all had the same shape. The only thing that had altered at all was what they meant. This had become their last run together. Bobbie felt like something in her body had shifted.

James Holden had been a strange person from the start. Before she'd ever known him, he'd been the man who'd slandered Mars. Then the one who saved it. To judge from what the greater chunk of humanity thought of him, he was an opportunistic narcissist or a hero of free speech, a tool of the OPA or the UN or a loose cannon answerable to no one. She'd seen him that way too, more than she'd known, when she took her place on the *Rocinante*. Since then, day by day, sometimes even hour by hour, the man

and his reputation had peeled away from each other. Captain James Holden of the *Rocinante* was a name to conjure with. The Holden she knew was a guy who drank too much coffee, got enthusiastic about weird things, and always seemed quietly worried that he would compromise his own idiosyncratic and unpredictable morality. The two versions of him were related the way a body and its shadow were. Connected, yes. Each inextricably related to the other, yes. But not the same thing.

And now he was moving on. And Naomi with him. Losing her was a strange thought too, but different. Naomi had fought against being a persona in the greater world, always letting her lover take the stage so that she wouldn't have to. When she stepped away, it wouldn't change the story that other people told about the *Rocinante* the same way, but Bobbie was going to feel her loss more. As much as Holden was the public face of the ship, Naomi was the person Bobbie had come to trust in their practical, day-to-day lives. Whatever Naomi said was true. And if that wasn't strictly accurate, it was close enough that Bobbie and the others relied on it with confidence.

When they were gone, nothing would be the same. Bobbie felt the sorrow in that. But, to her surprise, the joy too. She found herself going through her rounds, moving through the ship to check everything that had already been checked, marking anything that looked off—a gas pressure level that was dropping a fraction too quickly, a doorway that showed wear, a power link that was past its replacement date—and the ship itself had changed too. It was hers now. When she put her palm on the bulkhead and felt the thrum of the recyclers, it was her ship. When she woke strapped into her crash couch, even the darkness felt different.

She'd been a Marine—she would always be a Marine, even after that role didn't fit her anymore. Becoming the captain of the *Rocinante* felt right for her in a way she hadn't expected. The prospect of taking the captain's chair had the same sense of threat and anticipation that pulling on her power armor had back in the day. It was as if her old suit had changed with time—changed as much as she had—and become a ship. A worn one, yes. Out of date, but dangerous. Scarred, but solid. Not just a metaphor of who Bobbie was but also who she wanted to become.

She believed the others—Alex, Amos, Clarissa—were as comfortable with the shift as they claimed. And before, she'd have left it at that. Before it was her ship.

Now that she was going to be captain, it was her job to check.

Amos was in the machine shop, as he usually was, paging through feeds on the strategies for keeping an old gunship like theirs flying and safe. A stubble of white along the back of his skull caught the light where he hadn't shaved it in a couple of days. They were on the float, conserving reaction mass, but he was braced against the deck like he was anticipating a sudden change. Maybe he was, even if only out of habit. His thick, scarred hands tapped at the monitor, moving from subject to subject in the feed's tree—lace-plating structural repair, overgrowth in microflora-based air recyclers, auto-adapting power grids. All the thousand improvements that study of the alien technologies had spun off. He understood them all. It was easy to forget sometimes the depth of focus and intelligence behind Amos' cheerful violence.

"Hey, big man," Bobbie said, pulling herself to a stop with one of the handholds.

"Hey, Cap'n Babs," he said.

"How's it going?"

He looked over at her. "Well, I'm a little nervous about the plating we put down by the drive at that depot back on Stoddard. Lot of folks are seeing flaking with that batch under radiation bombardment. Figure when we hit Medina, I should hop outside and take a peek. Hate to have that turn into baklava on us when we were counting on it."

"That would suck," Bobbie agreed.

"Lace plating's great when it's great," Amos said, turning back to his screen.

"How's the rest of it?" Bobbie asked.

Amos shrugged, flicked through the feed. "Is what it is, I figure."

The silence settled between them. Bobbie scratched her neck, the soft sound of nails against skin louder than anything else in the room. She didn't know how to ask if he was going to be okay with Holden and Naomi leaving him behind.

"Are you going to be okay with Holden and Naomi leaving?"

"Yup," Amos said. "Why? You worried about it?"

"A little," Bobbie said, surprised to discover that it was true. "I mean, I know you saw it coming before Holden did. I think all of us did. But you've shipped with them for a lot of years."

"Yeah, but my favorite thing about Holden was knowing he'd take a

bullet for any one of the crew. Pretty sure you actually *have* taken a few for us, so that ain't changing," Amos said, then paused for a moment. "You might should check in with Peaches, though."

"You think?"

"Yup," Amos said. And that was that. Bobbie pulled herself back out.

Clarissa was in the medical bay, strapped into one of the autodocs. Tubes ran from the gently purring machinery into the port on the woman's side, blood flowing out of the thin body and then being pumped back in. Her skin was the color of a wax candle and stretched tight against her cheekbones. She still smiled and raised a hand in greeting when Bobbie floated in. As a technician, Clarissa Mao had always been one of the best Bobbie had worked with. She had the sense that the thin woman's drive came out of a kind of anger and desperation. Working to keep some greater darkness at bay. It was an impulse Bobbie understood.

"Rough patch?" Bobbie asked, nodding toward the blood-filled tubes.

"Not a great one," Clarissa said. "I'll be back on my feet tomorrow, though. Promise."

"No rush," Bobbie said. "We're doing fine."

"I know. It's just ..."

Bobbie cracked her knuckles. The autodoc chimed to itself and took another long draw of Clarissa's blood.

"You wanted something?" she said, looking into Bobbie's eyes. "It's okay. You can say it."

"I'm not your captain yet," Bobbie said. "But I'm going to be." It was the first time she'd said the words out loud. They felt good enough that she said them again. "I'm going to be. And that's going to put me in a position where I'm responsible for you. For your well-being."

She hadn't thought about her team in years. Her old team. Hillman. Gourab. Travis. Sa'id. Her last command before this. For a moment, they were in the room, invisible and voiceless, but as present as Clarissa. Bobbie swallowed and bit back a smile. This was it. This was what she'd been trying to find her way back to all these years. This was why it mattered that she do it right this time.

"And if I'm responsible for your well-being," she said, "we need to talk."

"All right."

"This thing with your old implants. That's going to get worse instead of

better,” Bobbie said.

“I know,” Clarissa said. “I’d take the implants out if it wouldn’t kill me faster.” She smiled, inviting Bobbie to smile with her. Making the truth into something like a joke.

“When we get to Medina, I’m going to hire on fresh crew,” Bobbie said. “Not co-owners in the ship the way we are. Just paid hands. Part of that is Holden and Naomi leaving.”

“But you can also hire someone for my place,” Clarissa said. Tears welled up, sheeting across her eyes as she nodded. The autodoc chimed again, pushing her purified blood back down into her.

“If you want to stay on Medina, you can,” Bobbie said. “If you want to stay with the ship, you’re welcome here.”

On the float, Clarissa’s tears didn’t fall. Surface tension held them to her until she shook her head, and then they’d form a dozen scattered balls of saline that in time would get sucked into the recycler and leave the air smelling a little more of sorrow and the sea.

“I ...” Clarissa began, then shook her head and shrugged helplessly. “I thought *I’d* be the first one to leave.”

She sobbed once, and Bobbie pushed over to her. Took her hand. Clarissa’s fingers were thin, but her grip was stronger than Bobbie expected. They stayed there together until Clarissa’s breath grew less ragged. Clarissa brought her other hand over and rested it on Bobbie’s arm. There was some color in her cheeks again, but Bobbie didn’t know if it was the flush of emotion or the medical systems doing their job. Maybe both.

“I understand,” Bobbie said. “It’s hard losing someone.”

“Yeah,” Clarissa said. “And ... I don’t know. Something about it seems less dignified when it’s Holden. You know what I mean? Of all the people to get choked up over.”

“No,” Bobbie said. “You don’t need to make light of it.”

Clarissa opened her mouth, closed it again. Nodded. “I’ll miss him, is all.”

“I know. I will too. And ... look, if you don’t want to talk about it now, I can just check your file for your medical plan and end-of-life choices. Whatever you and Holden worked out, I’m going to honor it.”

Clarissa’s pale, thin brows knotted. “Holden? I didn’t work out anything with Holden.”

Bobbie felt a little tug of surprise. “No?”

“We don’t talk about things like that,” Clarissa said. “I talked to Amos. He knows I want to stay here. With him. If things ever get too bad, he promised he’d ... make it easier for me. When the time comes.”

“Okay,” Bobbie said. “That’s good to know.” *And important*, she thought to herself, *to fully document so that if it happens in someone else’s jurisdiction no one gets arrested for murder. How the hell could Holden not have done that?* “You’re sure Holden never talked about this with you?”

Clarissa shook her head. The autodoc finished its run. The tubes detached from the port in Clarissa’s skin and slid back into the body of the ship like overly polite snakes.

“Okay, then,” Bobbie said. “I know now. I’ll make sure you’re taken care of. And Amos too.”

“Thank you. And I’m sorry.”

“About what?”

“I’ve been a little self-pitying about Naomi and Holden,” Clarissa said. “I didn’t mean to make it anyone else’s problem. I’ll get back to duty.”

“Everyone gets to mourn how they need to,” Bobbie said. “And *then* everyone needs to get their asses back to work.”

“Yes, sir,” Clarissa said with a sharp if ironic salute. “I’m glad we had this talk.”

“I am too,” Bobbie said as she pulled herself to the door. *And I’m amazed that Holden never did.* For the first time, Bobbie had the sense that there were some ways—not all, but some—in which she was going to be a much better captain than he’d been.

Chapter Ten: Drummer

Okay,” Drummer said, it felt like for the thousandth time, “but are these things naturally occurring or not?”

Cameron Tur, the union’s science advisor, was an impressively tall, gangly man with an Adam’s apple the size of a thumb and faded tattoos on each of his knuckles. He’d come into the service when Tjon was president of the union, and kept the job through Walker and Sanjrani. As old as he was and as much as he’d seen, she had expected him to have an air of condescension, but he’d only ever come across as a little ill at ease. His chuckle now was apologetic.

“That’s a good question, semantically speaking,” he said. “The difference between something made by nature and something made by beings that evolved up *within* nature, sa sa?”

“Difficult,” Emily Santos-Baca agreed. She was the representative of the policy council for the union’s board. Officially, she didn’t have a higher rank than any of the other councilors, but she got along with Drummer better than any of the others. It made her a sort of first-among-equals. She was younger than Drummer by exactly two years. They even had the same birthday. It made Drummer like the woman just a little bit, even when she was being a pain in the ass.

Drummer looked at the images again. The whatever-it-was was little longer than two hand-widths together, curved like a claw or a seedpod, and shining green and gray in the sunlight outside Gallish Complex on Fusang. She started the image playback, and the young man sprang into life, slotting one—claw, pod, whatever the hell it was—into another with an audible click to create an empty space roughly the shape of an almond. Light flickered into the space, shifting shapes that danced on the edge of meaning. The young man grinned into the camera and said the same things he had every time she’d watched him. *Watching the light is associated with feelings of great peace and connection with all forms of life in the galaxy,*

and appears to stimulate blah blah fucking blah. She stopped it again.

“Millions of them?” she asked.

“So far,” Tur agreed. “Once the mine goes deeper, they may find more.”

“Fuck.”

The colony worlds had begun simply enough. A few households, a few townships, a desperate scrabble against the local biosphere to make clean water and edible food. Sometimes colonies would falter and die before help could arrive. Sometimes they’d give up and evacuate. But more than a few took root on the rocks and unfamiliar soil of the distant planets. And as they found their niches, as they became stable, the first wave of deep exploration had begun. The massive underwater transport arches on Corazón Sagrado, the light-bending moths on Persephone, the programmable antibiotics from Ilus.

Evolution alone had created all the wonders and complexities of Earth. That same thing thirteen hundred times over would have been challenge enough, but added to that were the artifacts of the dead species of whatever the hell they’d been that had designed the protomolecule gates, the slow zone, the massive and eternal cities that seemed to exist somewhere on every world they’d discovered. Artifacts of alien toolmakers that had been able and willing to hijack all life on Earth just to make one more road between the stars.

Any of it could be the key to unimagined miracles. Or catastrophe. Or placebo-euphoric snake-oil light-show bullshit. The images from the seedpods could be the encrypted records of the fallen civilization that had built miracles they were still only beginning to understand. Or they could be the spores of whatever had killed them. Or they could be lava lamps. Who fucking knew?

“The science stations on Kinley are very anxious to get a shipment for study,” Santos-Baca said. “But without knowing whether these are technological artifacts or natural resources—”

“Which,” Tur apologized, “is difficult to determine with only the resources on Fusang—”

“I get it,” Drummer said and shifted to look at Santos-Baca. “Isn’t this kind of decision pretty much within *your* wheelhouse?”

“I have the votes to allow the contract,” Santos-Baca said, “but I don’t have enough to override a veto.”

Drummer nodded. The question wasn’t whether moving psychoactive

alien seedpods between worlds was a good idea so much as whether someone was going to lose face in front of a committee meeting. Thus were the great decisions of history made.

“If we don’t think they pose any immediate danger, ship them as alien artifacts with a third-level isolation protocol, and I’ll let it pass.”

“Thank you,” Santos-Baca said, rising from her seat. A moment later, Tur did the same.

“Stay with me for a minute, Emily,” Drummer said, shutting down the demonstration video from Fusang. “There’s something else I wanted to talk to you about.”

Tur left, closing the door behind him, and Santos-Baca sank back into her seat. Her empty half scowl was a mask. Drummer tried a smile. It worked as well as anything else.

“One of the things I learned working for Fred Johnson back in the day?” Drummer said. “Don’t let things sit for too long. It’s always tempting to just ignore the things that aren’t actually on fire just at the moment, but then you’re also committing to spend your time putting out fires.”

“You’re talking about the tariff structure Earth and Mars are proposing for Ganymede?”

Drummer’s heart sank a little. She’d managed to forget about that nascent issue, and being reminded felt oppressive. “No, I mean the *Rocinante* problem. And how it relates to—” She jerked a thumb toward the empty monitor where the seedpod video had been. “We’ve just taken control of the governor of a colony planet. The Association of Worlds hasn’t formally asked about his status with us yet, but it’s just a matter of time. I can feel Carrie Fisk rubbing her stubby little fingers together. It would make me very happy to get out in front of this.”

“So,” Santos-Baca said. “Well, I have had some informal conversations about it. The idea of asking the UN for a charter is ... it’s a hard sell. We didn’t come all this way to go back down dirtside to ask permission for things, now did we?”

Drummer nodded. The enmity between the inners and the Belt was still the biggest obstacle Drummer faced. And even she didn’t have *much* use for the Earth-Mars Coalition.

“I understand that,” Drummer said. “I don’t like it either. But it gives us a level of deniability for things like James Holden’s new policing schemes. What I don’t want is thirteen hundred planets deciding that the union is the

problem. If the UN is behind a crackdown—even just nominally—it spreads out the responsibility. This Houston and his band of merry men can rot in a UN jail, and then we’re still just the ships that take things from one place to another. Prisoners, among other things.”

“Or,” Santos-Baca said, “we admit what we’ve been playing footsie with since we crawled up out of the starving years. We start treating the union like the government of the thirteen hundred worlds.”

“I don’t want to be president of thirteen hundred worlds,” Drummer said. “I want to run a transport union that regulates trade through the gates. And then I want all those planets and moons and satellites to work out their own issues without it gumming up our works. We’re already stretched too thin.”

“If we had more personnel—”

“Emily,” Drummer said, “do you know the one thing I am absolutely sure won’t fix any of our problems? Another committee.”

Santos-Baca laughed, and a soft chime came from Drummer’s desk. An alert from Vaughn. High priority. She let it ride for a little bit. If it wasn’t People’s Home about to break apart, another minute wasn’t going to hurt. If it was, it wouldn’t help.

“You’ve seen all the same logistical reports that I have,” Drummer said. “Expecting the union to police the whole—”

The chime came again, louder this time. Drummer growled and tapped the screen to accept. Vaughn appeared, and before she could snap at the man, he spoke.

“Laconia put out a message, ma’am.”

Drummer looked at him. “What?”

“The warning message from Laconia gate was taken down,” Vaughn said. “It’s been replaced by a new message. The report from Medina came in”—he looked away and then back to her—“four minutes ago.”

“Is it broadcast?”

“Yes, ma’am,” Vaughn said. “Audio only. Not encrypted either. This is a press release.”

“Let me hear it,” she said.

The voice, when it came, was low and warm. It reminded her of a scratchy blanket she’d had once, comforting and rough in equal measure. She didn’t trust it.

“Citizens of the human coalition, this is Admiral Trejo of the Laconian

Naval Command. We are opening our gate. In one hundred and twenty hours, we will pass into the slow zone in transit to Medina Station with a staff and support to address Laconia's role in the greater human community going forward. We hope and expect this meeting will be amicable. Message repeats."

"Well," Santos-Baca said, and then stopped. "Didn't see that coming."

"All right," Drummer said, and looked into Santos-Baca's wide eyes. "Emily, get me everyone."

The void city People's Home was still in Mars orbit, down close to Earth and the sun, and hell and gone from the moons of Jupiter and Saturn. It took ten hours to hear back from all the experts in the union hierarchy, and five more for the system to review everything and build a unified report. Every question, every clarification, every new nuance or caveat would take about as long. Drummer was going to be spending most of the hundred and twenty hours before Laconia reopened waiting to hear from people. Their messages were flying between planets and moons, void cities and stations at the speed of light in vacuum, and it was still too damned slow.

The voice on the message matched Anton Trejo, a lieutenant in the MCRN who had gone to Laconia with the breakaway fleet after the bombardment of Earth. Yes, it was possible that the voice was faked, but the technical service tended to accept it as genuine. Medina Station reported light and radiation spikes coming through Laconia gate consistent with ships approaching on a braking burn. How many ships and of what kind, there wasn't enough information to guess at.

Mars had lost almost a third of its ships when the Free Navy made its brief, doomed grab at power. Those had been divided between the Free Navy's forces in Sol system and the breakaway fleet going to Laconia. In the decades since, Earth and Mars had slowly rebuilt their navies. Technological breakthroughs based on reverse engineering alien artifacts—lace plating, feedback bottles, inertial-compensating PDC cannons—were standard now. Even if the ships on the other side of Laconia gate had been able to glean some details of how the manufacturing processes worked, they would have to build shipyards and manufacturing bases before they could

start using them. Thirty years without a refit was a long time.

The most likely scenario was that something in Duarte's private banana republic had finally gone wrong enough that he was being forced back into contact to threaten or beg or barter whatever he—or whoever was in power by this time—needed to prop things up.

The flag in the intelligence report speculating about the fate of the active protomolecule sample that the Free Navy had stolen from Tycho during the war tripped Drummer up a little when she read it. She remembered that day. Fighting in her own corridors, her own station. Even now, she remembered the cold rage that came from discovering betrayal in her ranks. And Fred Johnson's leadership in the face of it.

She still missed Fred. And, sitting in her crash couch with the intelligence reports waiting patiently on her monitor, she wondered what he would have made of all this. Not just Duarte and Laconia, but all of it.

Her monitor chimed and the orange temporary-priority flag appeared. A new report from Medina with the updated analysis of the drive signatures from the far side of Laconia gate. She blew out a breath and opened it. Certainty factors were still thin, but the drives were either unregistered or altered so much they no longer matched the database. She ran her finger over the accompanying text to keep her tired eyes from sliding off them. There had been at least one *Donnager*-class battleship in Duarte's stolen fleet. Given the size of the incoming plume, it was possible this was that ship. Older, yes. Worn down. But still a powerhouse.

She stood, stretched. Her back ached from between her shoulder blades up to the base of her skull. She'd been spending too much time reading reports that she should have given to Vaughn. Digesting information down to the critical pieces was part of his job, after all. Used to be, it had been hers too. She trusted herself more than she did him.

She located Emily Santos-Baca on the ship. It was late, but the younger woman hadn't left for her quarters either. The system put her in the administrative commissary. The idea of food woke her stomach, and a hunger she hadn't noticed rose up like a flame. Drummer sent a quick message asking her to wait there for a few minutes. She shut down her monitor, put it in security lock, and made her way out.

The hallways of People's Home still had a sense of newness about them. The foot- and hand-holds on the walls didn't have the wear of a lived-in ship or station. The lights all had a brightness, subtle but unmistakable, that

spoke of recent installation. Not enough time for anything to age or break. Their great floating city would develop all of that in time, but for now, it and the others like it were the bright, perfect Singapores of their age. The well-regulated city. Now, if she could just push that out as far as the stars, everything would be just ducky.

She found Santos-Baca sitting with an older man in a gray jumpsuit. He nodded to Drummer as she approached. When she sat down, he left. Santos-Baca smiled.

“You look like you could use some food.”

“It’s been a while since lunch. I’ll get to that in a minute. You saw the reports?”

“I’m not quite caught up. But yes.”

“Where’s the board on this?”

The younger woman settled into herself, thoughtful and closed as a poker player. When she spoke, her voice was careful. “It’s hard to get too worried about a fleet of out-of-date Martian warships commanded by the remnants of a decades-old coup. Frankly, I’m a little surprised to find out there’s anyone alive there.”

“Agreed.”

“The message isn’t coming up with any particular flag of high stress in the vocal patterns. Or any demands, at least not as yet.”

“I know, Emily. I read the reports. I’m asking what you think of them.”

Santos-Baca opened her hands, an old-school gesture that said, *It’s right here in front of you*. “I think we’re about to see a bunch of self-centered assholes who’ve realized that their glorious independence isn’t going to work out in isolation. If we can keep them from losing face, we can probably find a negotiated path to reintegration. But Mars is going to be a problem. They’re going to want all of them trotted back to Olympus Mons and hung as traitors.”

“That’s what I was thinking too. Any idea how to approach them about this?”

“I’ve been trading some messages with Admiral Hu. She’s Earth, but she has friends in Martian high command,” Santos-Baca said. “Nothing formal. And McCahill in security.”

“Of course.”

“The other possibility is that they’re going to try force.”

“With ships that haven’t resupplied or seen a shipyard in decades,”

Drummer said. “And with our rail-gun emplacements all warmed up and ready to poke holes in anyone that gets too rowdy. Are we thinking that’s a realistic possibility?”

“It’s not the odds-on bet. Even when their fleet was new, taking out the rail-gun emplacements would have been a mighty tall order.”

Drummer considered. “We can get a couple ships as backup, just in case. If it turns out Laconia needs its ass kicked, I’m not sending our ships through their gate. But it may make that charter an easier sell. Let Mars smell blood and vengeance and see if the EMC gets more interested in enforcement and policing than it was before?”

“It would be a very different case,” Santos-Baca agreed. It was good that they were on the same page with this. Drummer had half-feared that the board was going to come up with their own strategy. Her job was herding kittens. Only thankfully not this time. She was trying to avoid being a police force. She sure as hell didn’t want to command a full military. If there was going to be a war on the far side of Laconia gate, let Mars fight it.

“All right then,” Drummer said. “Nothing we can’t handle.”

Chapter Eleven: Bobbie

When the *Roci* pulled into port at Medina, the security detail was there to take Houston into custody. Bobbie watched Holden as the prisoner marched away. She thought there'd been a melancholy look in Holden's eyes. The last thing he'd done as captain was hand over a man to live in a cell. Or she might have been reading more into the situation than was there. Drummer's threatened press release didn't appear.

After that, they'd all gone out to a club. Naomi rented a private room for all of them, and they'd eaten a dinner of vat-grown beef and fresh vegetables seasoned with mineral-rich salt and hot pepper. Bobbie tried not to get drunk or maudlin, but she was the only one. Except Amos. He'd watched all the hugging and weeping and protestations of love like a mom at a five-year-old's birthday party, indulgent and supportive, but not really engaged with it.

After they'd eaten, they went out to the floor of the club and danced and sang karaoke and drank a little more. And then Holden and Naomi left together, their arms around each other's hips, strolling out into Medina Station's corridors as if they were going to come back. Only they weren't.

The four of them made their way back to the port talking and laughing. Alex was reciting lines and acting out scenes from one of the neo-noir films he collected. She and Clarissa egged him on. Amos grinned and ambled along behind them, but she saw him watching the halls in case four old half-drunk space jockeys attracted any trouble. Not that there was a reason to expect it. It was just something he did. She noticed it in part because she did it too.

Back at the ship, the others scattered, floating to their rooms. Bobbie waited in the galley sipping a bulb of fresh coffee until they were gone. There was still one more thing she wanted to do before she called it a day, and it was something she wanted to do alone.

Around her, the *Rocinante* ticked as the residual heat of their journey

slowly radiated out into the absolute vacuum of the slow zone. The air recyclers hummed. A sense of peace descended over everything like she was a child again and this was the night after Christmas. She let her breath deepen and slow, feeling the ship around her like it was her skin. When she finished the last drop of coffee, she put the empty bulb into the recycler and drew herself down the corridor to Holden's cabin. The captain's cabin.

Hers.

Holden and Naomi had taken everything out already. The drawers were unlocked. The captain's safe was open and scrubbed, waiting for a new access code. The double-sized crash couch—the one Holden and Naomi had shared for so long—gleamed, clean and polished. The slightly acrid smell of fresh gel told her that Naomi had replaced it all before she went. Clean sheets for the new tenant. Bobbie let herself drift into the space, stretching out her arms and legs. Eyes closed, she listened to the peculiar quietness of this cabin, how it was like the one she'd been using these last years. How it was different. When she reached out to take a handhold, the wall was still a half a meter away. A double-sized crew cabin, created so Naomi and Holden could share the space, had become the privilege of being the *Rocinante*'s captain. She smiled at the thought.

The safe waited for her passcode. She fed it the prints from her thumb and two index fingers, then typed in the password she'd chosen and spoke it out loud for the system to learn. Sixteen digits long, committed to her memory, and not associated with anything outside itself. The safe closed with a solid clack, magnetic locks falling into place where it would take a welding torch and a lot of time to force. She pulled up her partition on the wall screen, checking to see that everything was in place. The drive was quiet, the reactor shut down, the environmental systems well within the green. Everything just the way it should be on her ship. It was going to take a while, she figured, before that thought didn't seem like she was playacting. Better that she got used to it, though. *Her ship*.

Four messages waited for her in the queue. The first two were automated messages, one confirming the docking agreement and fee structure for their present stay on Medina, the other showing the withdrawal from the group account of Holden and Naomi's lump cash-out. The *Rocinante* already sending her the things it used to route to Holden. The third was from Medina traffic control, but the fourth was from the man himself. James Holden. She opened that one first.

His face appeared on the screen, floating in the same room she was in now, back when it had been his. He was smiling, and she felt herself smiling back.

“Hey, Bobbie,” he said, and his voice seemed loud in the quiet. “I just wanted to leave this here for you as a note. I’ve spent a lot of time on the *Roci*. My best moments are part of this boat. And a bunch of the worst ones. And most of the people I love. I can’t think of anyone else in thirteen hundred worlds I’d trust with it the way I trust you. Thank you for taking this cup from me. And if there’s ever anything I can do to help out down the line, just say so. I may not be part of the crew anymore, but we’re still family.”

The message ended, and she flagged it to be saved. She opened the one from traffic control. A young man with deeply black skin and close-cropped hair nodded into his camera at her.

“Captain Holden, I am Michael Simeon with Medina Station security. I am sending this to inform you that, in accordance with union policy, the *Rocinante* is being called to a mandatory security contract. Your presence is required at a briefing on the incoming ambassadorial contact from Laconia at the location and time embedded in this message. Please confirm that you or your representative will be attending.”

Bobbie tapped the reply, considered herself in the screen for a moment before she pulled her hair back into a bun, and scowled her reply.

“This is Captain Draper of the *Rocinante*,” she said. “I’ll be there.”

Ten minutes into the briefing, Bobbie thought, *Oh. This is why he didn’t want the job anymore.*

The room was in the drum section of the station, up near the nonrotating command decks. The desks were lined up in rows like the worst kind of classroom, with hard seats and built-in drink holders that didn’t quite fit the cheap ceramic mugs they’d given out. There were around forty people in the uncomfortable seats with her—representatives of all the ships presently in the slow zone—but she and the executive officer of the *Tori Byron* had places of honor. Front row, center. Where the smart kids sat. The *Rocinante* and the *Tori Byron* were, after all, the only gunships around Medina at the

moment. All the rest were tugs and cargo haulers.

The man at the front of the room wasn't the one who'd summoned her, but his boss. Onni Langstiver was the head of the security forces and so, for the length of her mandatory temporary contract, technically her boss. He wore a Medina Station uniform like it was a mech driver's undersuit. Dandruff dotted his shoulders.

"The biggest thing is we don't want to seem aggressive," Langstiver said, "but we don't want to look passive either."

In her peripheral vision, the others nodded. Bobbie tried to crack her knuckles, but she'd already done it twice since she sat down and her joints were silent. Langstiver went on.

"We've got the rail-gun emplacements on the hub station, same like always, sa sa? So that anyone tries anything, we spark those up and—" The director of station security for the Transport Union cocked his fingers into little gun shapes and made pew-pew noises. "Probáb they come through like any ambassador. Dock, talk, and los politicos do their dance. But if they come through with ideas, we're ready. Not starting, but not a clean shot too, yeah?"

A general murmur of assent.

"You have to protect the guns," Bobbie said. "The rail-gun emplacements on the hub station? If they get a force onto the surface—"

"Savvy, savvy," Langstiver said, patting the air. "This is the *Tori Byron*, yeah?"

"What we need is intelligence about what's coming through that gate before it comes through," Bobbie said, knowing as the words passed her lips that she wasn't going to be thanked for them. Still, now that she'd started ... "A dozen probes going through the gate now could relay back whether we're looking at a *Donnager*-class battleship or a few gunships or just a shuttle. How we get ready for any of those should be different—"

"Yeah, thought of that," Langstiver said. "Don't want to be provocative, though, yeah? And anyway, we're not going to act much different no matter what. Working with what we're working with."

"So send a ship through with a fruit basket," Bobbie said. "Greet them on their territory and get a report back."

Langstiver stopped and stared at her. She stared back. The room was quiet for a long breath. Then another. He looked away first. "Can't send a manned ship through. Union rules. Is in the work agreement, yeah? So we

put *Tori Byron* up like an honor guard. The *Rocinante* in Medina's shadow, make sure no one lands that isn't welcome. Everyone else in dock or cleared out enough to put a clear path between Laconia gate and Medina. Everyone that gets delayed, the union picks up the fees. *Tori Byron* gets full security contract schedule. *Rocinante* gets three-quarters for support role. Standard."

Bobbie wondered what Holden would have done in this moment. Made an impassioned speech about how the union rules were restricting them past the point of tactical competence? Smiled his I-don't-actually-like-you-very-much smile, then gone back to the ship and done whatever the hell he wanted to do anyway? Or sucked it up as a battle that wasn't worth fighting?

Only it was her battle now, and while she was very clear that she was in the right, it was also evident that her position wasn't going to help her change Langstiver's plan. She couldn't beat sense into a stone. Not even when it seemed fun to try.

"Understood," Bobbie said.

All the way back to the dock, her jaw was clenched. It was just people. They were the same everywhere. She'd dealt with bureaucracy when she was in the service and when she'd done her veteran's outreach work. She'd run up against it when Fred Johnson had the idiotic plan to make her kind of an ersatz Martian ambassador during the constitutional crisis. And when she'd taken her place on the *Rocinante*, she'd been happy to let Holden or sometimes Naomi take point on the bullshit diplomatic dance-and-kiss charade.

It wasn't even that she was worried about the outcome of this particular encounter. It was that there was a better approach, she'd told them what it was, and they weren't going to do it. And her ship—her people—were going to shoulder some part of the unnecessary risk. There was no scenario ever that was going to make that okay with her.

As a generation ship, the *Nauvoo* hadn't expected to berth a lot of ships. As a battleship, the *Behemoth's* needs had been minimal. What hadn't been there, time and necessity had added. The major docks on Medina Station were outside the drum, down near the engineering decks and the long-quiescent drive that had been designed to launch the ship on a centuries-long voyage to the stars. A smaller dock had been built on the far end of the drum, near the command decks, but it was used more for private shuttles

and diplomatic meetings. The *Rocinante* was berthed in the main docks, not far from the *Tori Byron*, and Bobbie cycled into the airlock with her sense of rage starting to fade. A little. She could hate it and still do the job. That was all she could do, really.

“Welcome back,” Alex said over the ship comms as the inner doors of the airlock cycled closed. “There a plan?”

“Plan is to hang back and see if the new Laconian ambassador needs to show everyone how big his dick is,” Bobbie said. “The *Tori Byron* and the rail-gun emplacements are taking point. We’ll hang back and splash any boarding teams that get close.”

She pulled herself past the lockers, out to the lift, and up toward ops. Alex’s voice shifted from the comms to his actual voice as she got close.

“Well, good that we won’t be the first ones getting shot at. I mean, assuming anyone gets shot at all. Got to admit I’m a little bit hoping they try something.”

“You mean because Duarte and his people are a bunch of traitors to the republic who all deserve to hang for treason?”

“And theft. Don’t forget theft. And not warning anyone when the Free Navy was looking to kill a few billion people. I mean, I’m all for forgiveness and bygones being bygones, but it’s easier to stomach that after the assholes are all dead.”

Bobbie strapped herself into a crash couch. “This may not even be Duarte’s people. For all we know, he got stabbed in his bathtub fifteen years ago.”

“A man can hope,” Alex agreed. The dimness of the ops deck meant most of the light on his face was splashing up from the monitor. “I shifted the *Roci* back to a four-person-crew configuration.”

“It’s not enough,” Bobbie said. “We need more crew.”

“We did it this way for years before you and Claire joined up. It works better than you expect. Hey ... Look, since there’s a chance that someone might be trying to poke holes through Medina Station, would you mind if I kept Holden and Naomi on the ship’s channel? Just in case?”

Bobbie hesitated. Part of her bridled at the prospect of having personnel who weren’t on the operation still be in the communications chain. But it was Holden and Naomi, and cutting them out also felt strange. Alex was waiting for an answer. She made a gesture as if she’d been thinking of something else.

“Of course not,” Bobbie said. “They’re family.” Alex’s faint smile meant he’d known she’d say it, and was glad she’d said it that way. She opened a connection to Amos and Clarissa. “Okay, everyone. Preflight checks. Let’s get ourselves into position.”

The slow zone—gates, Medina Station, and the alien hub station with the rail guns—was only tiny if compared to the vastness of normal space. The whole volume was smaller than the sun, and with the guesses she’d seen about how much energy it took to hold the gates open and stable, probably equally energetic, but controlled by forces they were still struggling to make sense of. And between the gates, a darkness that matter and energy slipped into, but from which nothing ever came back. The not-emptiness past the gates left her feeling a little claustrophobic, with only a sphere a million clicks across to move in.

Even that constrained, Medina Station would have been too small to see on her monitor if it had all been rendered to scale. Instead, she had a window with the full system—gates, stations, the *Roci*, the *Tori Byron*, the rail-gun emplacements—on one side of her monitor and three smaller displays showing tactical displays of the *Roci* in the needle-thin radar shadow of Medina, the *Tori Byron*, and Laconia gate respectively. A countdown timer marked the minutes and seconds until this Admiral Trejo said he’d be coming through. Her shoulders were tight. She felt like they were in the moment between throwing dice and seeing what numbers had come up. The gambler’s high. She didn’t like how much she liked it.

“Medina’s sensors are getting something,” Clarissa said from the engineering deck.

“Throw me the update, please,” Bobbie said, and the screen with Laconia gate on her monitor shifted to a live feed of the gate itself, enhanced in false color to make the darkness legible. The weird circle of the gate. The wavering stars beyond it, and a looming shadow coming through. Even just watching the stars go out behind it, Bobbie could tell it was a big ship. Maybe it was their *Donnager*-class battleship. And that in itself would be the Laconians making a statement.

Unless it was something else.

The ship that came through first looked *wrong*. It was something more than the weirdly organic shape of it. The way the false color struggled to make sense of its surface was like a graphical glitch or something out of a dream. She found herself looking for seams where its plating came together,

and there was nothing. Her mind kept trying to see it as a ship, but defaulting to some kind of ancient sea creature from the deep trenches of Earth.

“That ain’t one of ours,” Alex said. “Shit. Where did they *get* that?”

“I don’t like this,” Clarissa said.

Me neither, little sister, Bobbie thought.

On the traffic-control channel, the captain of the *Tori Byron* was hailing the Laconian whatever it was, ordering it to come to a full stop. Bobbie nodded at the screen, willing Trejo to respond. To make this a more normal interaction. Instead the strange ship continued on its course, placid and implacable. Another drive plume still showed on the other side of the gate. Much smaller, but a second ship all the same. After a moment, the *Tori Byron* lit its main drive, moving itself in on an intercept. It was like watching a house cat preparing to face down a lion.

This is your final warning, the *Tori Byron* announced. Bobbie’s monitor updated. The *Tori Byron* had hit the big ship with a target lock—

And then it was gone. Where the *Tori* had been, only a sparkling cloud of matter so strange the *Roci*’s sensors didn’t know what to make of it.

“What the fuck!” Alex breathed. “Did they shoot something? I didn’t see them shoot anything!”

Bobbie’s stomach felt so heavy, it seemed like it ought to be dragging her down, even on the float. She opened a channel to the rail-gun emplacements before she was consciously aware she’d done it, the certainty growing in her even as she got the lock that it wouldn’t be enough. That nothing would be. But there was a way you did these things. An order to battle, even when the battle was doomed.

“Fire, fire, fire!” she shouted.

On her screen the rail guns spat.

Chapter Twelve: Holden

The Transport Union comptroller's offices were buried three levels deep in the thick walls of Medina Station's rotating drum. It made the Coriolis slightly less noticeable than inside the drum, but also meant that they were inside gray metal cubes with desks in them and no screens to even give the illusion of a window. Holden couldn't say for sure why it felt more depressing than sitting in the metal cubes of a spaceship compartment, but it was. Naomi sat beside him, watching the newsfeeds on her hand terminal, unaffected by the grim locale. The *Rocinante* was doing a mandatory security contract. The first gig since they'd left. Maybe that was what he was reacting to.

"Form 4011-D transfers your retainer and future contracts to Roberta W. Draper, and states that she is now the legal captain of the *Rocinante*, and president of Rocicorp, a Ceres-registered corporate entity."

The Transport Union representative who was processing their paperwork handed Holden an oversized terminal covered in legalese. She had a pinched face, deep frown lines on her forehead and around her mouth, and wore her hair in short spikes dyed flaming red. Holden thought she looked like a disgruntled puffer fish, but recognized his unflattering opinion was at least partly a reaction to the mountain of forms she'd made him fill out.

"You do know," the puffer fish said, "that this is a temporary change of status, pending the legal change-of-ownership registration?"

"Our next stop is the bank, where we'll be finalizing the loan to sell the ship."

"Mmhmm," Puffer said, making it a sound of deep skepticism.

As Holden filled out the next of the endless forms, he listened to the small voices coming from Naomi's terminal. He only caught about every third word, but the hot topic of conversation was definitely the approaching Laconian ships.

"Luna," Naomi said.

“Something happening on Luna?”

“No, I mean, let’s try Luna first. It’ll be easy to find consulting gigs, what with all the work going on down on Earth.”

“I’m not sure I—” Holden started.

“Not you. Me. I could get consulting gigs. I like the gravity there. And you could pop down the well whenever you wanted to visit your parents.”

“True.” His parents were all pushing the centenarian mark, and while he’d been lucky and they were all in pretty good shape, he didn’t want them doing orbital launches to visit him if they could avoid it.

“And it’s all very far from this,” she said, pointing at her screen.

“Not a bad thing,” he agreed, and handed his filled-out screen back to the puffer. “But I did like the idea of living in exuberant decadence on Titan.”

“When we have enough money to do that for another three decades. Two hours,” Naomi said, and Holden didn’t need to ask what she was referring to. Two hours until the first representatives from Laconia to come through their gate in decades would arrive.

“We done here?”

The puffer agreed that they were.

“I could use a drink,” Holden said. “Let’s go get a drink and watch the big arrival on the screens in a bar or something.”

They did.

It didn’t go well.

Holden ran across the open fields of the rotating drum, heading toward the lift up to Medina’s command center. The adrenaline pumping through his veins only seemed to make his heart beat faster without speeding him up. It occurred to him, with a sort of surreal detachment, that this was exactly like many nightmares he’d had. He reached the lift station, pressed the call button, and willed the doors to open.

Bobbie was yelling *Fire, fire, fire* on the *Roci*’s group channel, her voice coming out of his terminal loud, but not panicky. Commanding. On the screen, Alex was sending him the *Roci*’s tactical display. Three of the rail guns on the hub station fired at the massive Laconian ship. The shots all hit,

tearing holes in the hull, but the breaches closed almost as fast as they were created. It didn't look like damage-control systems. It looked like it was healing.

Holden had seen that sort of nearly instantaneous repair before. But not on human technologies. It took a really bad situation and made it a nightmare.

"Bobbie," he yelled back at the terminal. "Keep the ship—"

He didn't get to finish, because the screen flashed white and died. Medina actually shuddered. The entire station shook and rang like a bell.

"Jim," Naomi said, and then couldn't finish because she was still gasping for breath from their run. She made the Belter hand signal for emergency. *Should we be looking for a shelter?* It was a valid question. If the Laconians started poking holes in Medina, they'd want to be in a sealed emergency compartment with its own air supply.

"Go find one," he said. "But I need to get up to command."

"Why?"

Another valid question. *Because I've fought in three major wars*, he thought. *Because the Belters running the station are the ones that didn't join Marco's Free Navy, so they've never been in this kind of fight. They'll need my experience.* All perfectly true and probably valid reasons. But he didn't say them out loud, because he knew Naomi would see through them instantly to the truth. *Because something terrible is happening, and I don't know how not to be in the middle of it.*

The doors finally opened, and the car recognized him as a captain with union clearances and gave him access to the overrides. As they went up, the feeling of gravity slowly turned into a lurching sideways motion and then disappeared. The lift opened onto corridors that Holden remembered fighting through under heavy fire, back when humans first found their way into the ring system. That astonishing moment in human history, passing through a stable wormhole into an alien-created network of interstellar gates, had just led to a whole bunch of people deciding to shoot each other. And now, a group of people who'd been isolated from humanity for decades were rejoining society just as things seemed to be going pretty well. And what did they do? Start shooting.

Holden's terminal gave a gentle ping and then reconnected to the network. A moment later, Alex's face appeared.

"You still there, Cap?"

“Yeah, just outside Medina ops. Did that thing hit the station? Not seeing any atmo-loss alerts here.”

“It shot the—” Alex started, then said, “It’s easier to show you. Take a look at this shit.”

“Just a minute.”

Holden slapped the wall panel, and the door slid open. He pulled himself inside the ops center.

The duty officer put up a hand. “You can’t come in here, sir. I mean, Captain Holden. Sir.”

“Who’s in charge right now?”

“Me?”

Holden had met her once before at a Transport Union function. Daphne Kohl. A competent technician. Somebody who’d done an engineering tour on Tycho. Perfect for noncombat ops duty on a station like Medina. Absolutely out of her depth now.

“Holden?” Alex said. “You still there?”

Holden turned his hand terminal so that the duty officer could see it too.

“Go ahead, Alex.”

On his hand-terminal screen, the massive Laconian ship was floating past the ring gate. It had a thick lozenge shape, not quite circular in cross-section, and with a variety of asymmetrical projections jutting out from the sides. More organic than constructed.

It came to a gentle stop just inside the ring gate. The *Tori Byron*, the Transport Union’s cruiser tasked with defending Medina Station, moved toward it. Holden couldn’t see or hear them, but he imagined the stream of hails and demands the *Byron* was throwing at the Laconian ship. Then, happening so fast it was like a glitch in the graphic, the *Byron* turned into a rapidly expanding cloud of superheated gas and metal fragments. In the playback, Bobbie was yelling, *Fire, fire, fire*, and the rail guns on the hub station opened up.

The image jittered, and the rail guns were ripped away from the hub and sent spinning off, fracturing into a cloud of ceramic shrapnel as they went.

“That’s what you felt,” Alex said. “The second time they fired that weapon, every ship in the zone shook, and half the electronics blew out.”

“What,” Holden said, “the fuck was that?”

Alex didn’t answer. His expression was as eloquent as a shrug.

“Okay, I assume Bobbie’s got you guys hiding in the station’s radar

shadow still, since I'm talking to you and you're not dead."

"Yeah," Alex said. "She seems pretty strongly in favor of not doing anything to make it mad."

"Let me see what we can find out here, and I'll call back."

"Copy that," Alex said. "*Roci* out."

"It's ... magnetic?" Naomi said, her tone managing to be authoritative and astounded at the same time. *This is what it is, but I don't believe what I'm seeing.* She'd floated across the ops center to one of the consoles and was working with the tech there. "It's reading as an incredibly strong magnetic field focused down to a narrow beam."

"Is that possible?" the duty officer said, her voice small and tight.

"Only if you define 'possible' as things that have already happened," Naomi said, not turning to look at her.

"So anything made of metal is vulnerable," another tech said.

"It isn't just metal," Holden replied, then pushed off to drift over to Naomi's station and look at the data she was pulling up.

"Everything has a magnetic field," Naomi added. "Usually it's too weak to matter. But at the levels that beam is hitting, it could spaghettify hydrogen atoms. Anything it touches will be ripped apart."

"There's no way to defend against something like that," Holden said, then went limp. In microgravity, it was not as satisfying as collapsing into a chair would have been.

"That's what shook Medina," Naomi added. "Just the beam passing near us. The maneuvering thrusters had to fire to hold us still."

"Holden, this is Draper," his terminal said.

"Holden here."

"Looks like that big bastard is ignoring us as long as we stay really still and keep the weapons unpowered."

"That's a good sign," Holden said. "It might mean they're not looking to kill everyone. Just making a point of destroying anything that's a threat."

"Point loudly and clearly made," Bobbie agreed. "But be aware, there is a second ship. Smaller. And it's heading for Medina."

"Tactical assessment?"

"Based on how thoroughly they took out our defenses," Bobbie said, "I'd bet they do a hard breach, storm ops and the reactor room, and grab full control of the station. If their ground troops have tech like that ship does, it shouldn't take long."

“Copy that. I’m going to try to minimize casualties down here. Wait for me to make contact. Holden out.”

“Hard breach?” Naomi asked, though her tone said she already knew the answer.

“They’ll drop fire teams all over the station to take over access points, control centers, power, and environmental support,” Holden replied, more to the room at large than to Naomi. He turned to Daphne Kohl. “I think you should have everyone here start making calls. Get every union and planetary rep in secure locations, but tell their security details to stand down. No visible weapons. Tell them we’re *not* attempting to repel boarders. That’ll just get people killed, and maybe piss off that monster of a ship.”

“Yes, sir,” she said. “Are you taking command?”

“No, I’m not. But this is the right thing to do, and we need to do it now. So we should do it. Please.”

Her expression fell a degree. She’d hoped someone in authority had arrived. Someone who knew what to do. He recognized the hope and the disappointment both.

“We’re not going to fight back at all?” Kohl asked.

He gestured toward the screens. The dust that was *Tori Byron* and the rail-gun emplacements. Kohl looked away. Still, he couldn’t bring himself to say no.

“Not yet,” Holden said. Naomi was already collecting side-arms from the other techs in the ops center and putting them in a duffel bag. *Not yet.*

The second ship looked to be about destroyer sized, to Holden’s eye. It did a slow flyover of Medina Station, taking out the torpedo racks and PDC emplacements with pinpoint-accurate rail-gun shots, then dropping a dozen Marine landing craft.

As it came, Kohl did as he suggested, passing the word throughout the ship not to resist. Live to fight another day. After the last call, she seemed to sway for a moment, then turned, spat on the deck, and pulled up something that looked like a security interface.

“What are you doing?”

“Purging the security system,” she said. “No census. No biometric records. No deck plans. No records. We can’t stop the fuckers, but we don’t need to make it easy for them.”

“Fou bien,” Naomi said, approving. Holden wondered whether the

forces coming in would be able to track the decision back to her. He hoped they wouldn't.

Each landing craft held a fire team of eight Marines, all wearing power armor of an unusual design—like Bobbie's but with different articulation at the joints, and all in a vibrant blue that made them seem like something that had hauled itself up from the sea. The Marines were methodical and professional. Where the doors opened for them, they entered without causing damage. Where they found locked doors, they breached with ruthless efficiency, blowing the door seals and hauling the plates back in a single, well-trained motion. When they passed unarmed civilians, they moved on by with nothing more than a warning not to resist. The few times they ran into someone with a hero complex who tried to fight back, they killed whoever presented a threat, but no one else. That it wasn't a straight-out massacre was the only comfort.

Watching it all happen from his position in the ops center, Holden found that he had to admire the level of training and discipline the Laconians displayed. They left no doubt that they were absolutely in charge, and they responded to any aggression with immediate lethal force. But they didn't abuse the civilians. They didn't push anyone around. They showed nothing that looked like bravado or bullying. Even the violence didn't have any anger behind it. They were like animal handlers. Holden, Naomi, and the rest of the ops-center techs did what they could to keep the station populace from panicking or foolishly resisting, but it was almost irrelevant. Nothing kept the people calmer than the calm their invaders demonstrated.

When the door to the ops center opened and one of the fire teams entered, Holden told everyone in the room to raise their hands in surrender. A tall, dark-skinned woman in armor with insignia that looked like a modified Martian colonel rank walked toward him on magnetic boots.

"I am Colonel Tanaka," she said, her voice booming with electronically augmented volume. "Medina Station is under our control. Please indicate that you understand and are complying."

Holden nodded and gave her his best fake smile. "I understand and as long as you continue to not abuse the people here, we will not violently resist."

It was a deliberate provocation. If Tanaka were there to flex her muscles and show how important and in charge she was, she'd point out that her people could abuse the populace to their heart's content and there wasn't a

damn thing he could do about it.

Instead she said, “Understood. Prepare a hard dock at the reactor level of the station for our ship.”

When the dockmaster indicated that it was ready, Tanaka touched a control on her wrist and said, “Captain Singh, a berth is being prepped for docking. The station is ours.”

“I am Captain Santiago Singh of the Laconian destroyer *Gathering Storm*,” the young man said. “I’m here to accept your surrender.”

His uniform was trim and spotless. The design looked Martian, except for the blue-gray color scheme where Holden was used to red and black. Kohl floated before him, confusion in her eyes.

“This is an act of war,” she said, her voice trembling. Holden felt an urge to step in, refocus the man onto him just to make her safer. It was a stupid impulse. “The union. The Earth-Mars Coalition. The Association of Worlds. They won’t stand for this.”

“I know,” the young man said. “This is going to be all right. But I have to accept your surrender now, please.”

She braced to attention, and it was over.

It had taken less than four hours from the first transit. Marines in Laconian power armor patrolled the corridors and command points of the station. Naval personnel in sharply designed uniforms hurried about hooking equipment into various communication and environmental systems with a well-practiced efficiency. The people of Medina mostly watched in a sort of dazed shock.

It had all happened so quickly. It was impossible to process.

He and Naomi were swept up along with the hundreds of representatives from the colonized worlds, several dozen reps from the Transport Union, the senior staff of Medina Station. He didn’t have any actual authority. He wasn’t even technically the captain of a ship or a member of the Transport Union anymore, but no one argued. They all gathered in the coalition-council room, an amphitheater with two thousand seats and a stage with a podium on it that consciously aped the layout of the General Assembly of the UN back on Earth.

Admiral Trejo was a stocky older man, with the relaxed air of a person who'd spent so long holding a military posture that he looks comfortable in it. He took his place at the podium flanked by a pair of Marines. Captain Singh and Colonel Tanaka stood respectfully behind him and off to one side.

"Greetings," the admiral said, smiling out at them. "I am High Admiral Anton Trejo of the Laconian Empire, and personal representative of High Consul Winston Duarte, our leader. And now your leader as well."

He paused as though waiting for applause. After a moment, he continued.

"As you know, we have accepted control of Medina Station. And yes, we intend to take control of all the thirteen hundred worlds it leads to. This isn't an act of aggression, but necessity. We bear no ill will or animosity toward any of you. As you've seen, this will be as bloodless a transition as *you* allow it to be. I'm bringing you here to implore you to please, *please*, contact your home worlds. We will make communications available for anyone who will tell them to peacefully relinquish control to us. If they do this, there will be no need for violence of any kind."

"I admit I kind of like these guys," Holden whispered to Naomi. "I mean as conquistadors go."

"There'll be a 'but,'" she said. "There's always a 'but.'"

"Cooperation is the coin of the empire," Trejo continued. "The beginnings were already in motion here. Your Association of Worlds. The Transport Union. All of these things will continue. High Consul Duarte *wants* input and representation from all the systems humanity has colonized and will colonize. The Transport Union is a vital apparatus in supporting those efforts. Both organizations can and must continue their important work.

"The only thing that has changed is that High Consul Duarte will be expediting the process. The Laconian fleet will be the defenders of a new galactic civilization of which you will all be welcome citizens. The only price is cooperation with the new order, and a tax to be paid to the empire that will not be onerous, and will be entirely invested back into the creation of new infrastructure and aid to fledgling or struggling planetary economies. The golden age of man will begin under the high consul's leadership."

Trejo paused again, his smile slipping. He looked pained and saddened

by what he was about to say.

“Here it comes,” Naomi whispered.

“But to those who intend to defy this new government and try to deny humanity its bright future, I say this: You will be eradicated without hesitation or mercy. The military might of Laconia has only one function, and that is the defense and protection of the empire and its citizens. Loyal citizens of the empire will know only peace and prosperity, and the absolute certainty of their own safety under our watchful eye. Disloyalty has one outcome: death.”

“Ah,” Naomi said, though it was more a long exhalation than a word. “The nicest totalitarian government ever, I’m sure.”

“By the time we figure out all the ways it isn’t,” Holden said, “it will be too late to do anything about it.”

“Will be?” Naomi asked. “Or *is*?”

OceanofPDF.com

Chapter Thirteen: Drummer

McCahill, head of the security council, spread his hands before him like he was trying to talk a gunman into putting down his weapon. “We were all taken by surprise. And I think we can all agree this was a failure of intelligence.”

“Well, if we all agree, then I guess it’s not a problem,” Drummer said. McCahill flinched a little. “What the hell *happened* out there?”

The meeting room was small—McCahill, Santos-Baca, and the present liaison of the Earth-Mars Coalition, Benedito Lafflin. And Vaughn haunting the back of the room like a funeral director at a wake. There were others in her feed. Messages from every division of the union and dozens of organizations outside it too. A kicked anthill the size of the solar system, and all of them wanting answers and leadership from her. It would take days to view all of them, weeks to reply, and she didn’t have the time or the energy. She needed answers.

Answers and a way to turn time backward long enough to undo what had already happened.

Lafflin was a thick-faced man with a tight haircut that made him look like a particularly self-satisfied toad. He cleared his throat. “Data on Laconia has always been thin,” he said. He had a reedy voice and the manner of a doctor explaining why he’d left a sponge in someone’s belly by mistake. “The defecting forces from Mars have been playing their keep-away message since before the Transport Union was chartered. They’ve flooded the gate from the realspace side with chatter along the whole electromagnetic spectrum—radio, visible light, X-ray, everything. We’ve had no passive intelligence to speak of. The few times that probes were sent through, they were disabled or destroyed.

“The official doctrine put in during the first years of the union was blockade. The navies of Earth and Mars were both badly damaged in the fight against the Free Navy, the focus of governance was disaster recovery

on Earth and minimizing the collapse of infrastructure. Laconia never presented an active threat, and ...”

“You’re telling me the missing navy was just never a priority?” Drummer said, but she already knew the answer: Yes, that’s what he was saying.

Sleeping dogs had been left to lie until they were good and rested. And the sting of it was worse because some of that at least had been during her watch. She was as guilty as anyone of taking her eye off the ball.

The images that had come through from Medina were surreal. The ship that had sailed through from Laconia didn’t resemble anything that had gone out through the gate decades ago. The blast that had scattered the *Tori Byron* was more like high-energy stellar phenomena than a weapon humanity had conceived. And the destruction of the rail-gun emplacements had been accompanied by a blast of gamma radiation from the gates themselves that Cameron Tur had described as the energetic equivalent of a solar flare. It had destroyed the *Sharon Chavez*, a freighter that had been waiting for clearance from Medina’s traffic control. Her crew died in the blink of an eye, and not even from a direct attack. It wasn’t something Drummer could get her mind to accept. It was too big. Too strange. Too sudden.

“The attacker has disabled the relay network,” Vaughn said, answering something Santos-Baca had asked. “There are no new signals coming in or out of the ring space. Medina is effectively cut off.”

Drummer squeezed her fists until they ached. She couldn’t let her mind wander like that. It didn’t matter that she felt traumatized. The union was under attack, and it was all on her. She had to keep focus. “We do have some record from the freighter that was parked outside the gate. The interference is too severe to get anything with high definition, but enough that we can say with some confidence that Medina Station was boarded. We have to assume it’s been taken.”

“Can we get data through the gates?” Drummer asked. “Radio loud enough to carry through the interference on both sides? Or tightbeams? Something to get messages to the other systems?”

“It’s possible,” Lafflin said in a tone of voice that meant he didn’t actually think it was possible. “But it would certainly be monitored. And our encryption schema aren’t breakable by any known tech, but we’re not looking at known tech.” His hand terminal chimed. He glanced at the

message and lifted his eyebrow. “Excuse me for a moment. Someone’s made a mistake.”

Drummer waved her permission, and the inner left them to themselves. When the doors had closed behind him, she turned to Santos-Baca and McCahill. “Well, seeing as it’s just us, what are the options?”

“If we can find a way to communicate with the other systems, we can coordinate a counterattack,” Santos-Baca said. “I’ve been putting together a spreadsheet of the resources we have in each system.”

“Let me see,” Drummer said. Santos-Baca flipped the data to Drummer’s display. More than thirteen hundred gates, each opening onto a new solar system. Almost all of them with colonies that varied from barely functioning villages to scientific complexes that were on the ragged edge of self-sustainability. The union’s void cities were the largest ships, but she could only pour attacking forces through so quickly without losing them to the gate’s glitches. She’d be sending them through one at a time to be mowed down. She pressed her fingers to her lips, pinching the flesh against her teeth until it ached a little. There was a way. There had to be a way.

She had to put first things first. And that meant reestablishing communications with all the union forces in all the systems. Some kind of stealth relay system had to be put in place. Maybe some kind of feint that would draw the enemy’s attention long enough to let her sneak new repeaters on either side of if not all the gates, then a strategic few—

“Ma’am,” Lafflin said from behind her, “please, you can’t—”

An unfamiliar voice answered. “Give it a fucking rest, Benedito. I can do whatever the fuck I want. Who’s going to tell me not to? You?”

The old woman moved slowly, using a cane even in the light gravity of People’s Home. Her hair was blindingly white, thinning, and pulled back in a bun at the base of her skull. Her skin was slack and papery, but there was an intelligence in her eyes that the years hadn’t dimmed. She looked up at Drummer, and smiled with the warmth of a grandmother. “Camina. It’s good to see you. I got the first shuttle I could. How’s your brother doing?”

Drummer pushed through a flurry of reactions—surprise that the woman was here, a flicker of starstruck awe, disorientation at being called by her first name in public, distrust that Chrisjen Avasarala—the retired grand dame of inner-planet politics—knew about her brother at all, and finally the solid certainty that every feeling she’d just experienced had been anticipated. More than anticipated. Designed. It was all a manipulation, but

done so well and with such grace that knowing that didn't make it ineffective.

"He's fine," Drummer said. "The regrowth went well."

"Good, good," Avasarala said, lowering herself into a chair. "Astounding what they can do with neural replacement these days. When I was growing up, they cocked it up more than they got it right. I had most of my peripheral nervous system redone a couple years ago. Works better than the old stuff, except my leg gets restless at night."

Santos-Baca and McCahill both smiled, but with anxiety in their eyes.

"Ma'am," Lafflin said, "please. We're in the middle of a meeting."

"You can finish it later," Avasarala said. "President Drummer and I need to talk."

"I didn't see you on my schedule," Drummer said mildly. Avasarala turned back to her. The warmth was gone, but the intellect was there, sharp and feral.

"I've been where you are right now," the old woman said. "I'm the only one in the whole human race who has. The way your stomach feels when you try to eat? The part of you that's screaming all the time, even when you're acting calm? The guilt? Anyone who's had a child in the hospital has suffered through that shit. But the part where all human history rides on what you do, and you only get one shot? That's only you and me. I came because you need me here."

"I appreciate—"

"You're about to fuck up," Avasarala said, and her voice was harder than stone. "I can keep that from happening. And we can have that conversation here in front of these poor fucking shitheads, or you can roll your eyes and humor the crazy old bitch with a cup of tea and we can have a little privacy. You can blame me for it. I won't mind. I'm too old and tired for shame."

Drummer laced her fingers together. Her jaw ached, and she had to focus to unclench it. She wanted to scream. She wanted to have Avasarala thrown out of the city in a plastic emergency bubble with a note tacked to her cane that said *Make an appointment first*. She wanted to see McCahill and Santos-Baca look at her with awe and fear at the violence of her reaction. And none of those things had anything to do with Chrisjen Avasarala. They were all of them about what had happened to Medina.

"Vaughn," Drummer said. "Could you get Madam Avasarala a pot of tea? We'll take a recess of an hour or so."

“Of course, Madam President,” Vaughn said. The others rose from their chairs. Santos-Baca took a moment to shake Avasarala’s hand before she left. Drummer scratched her chin even though it didn’t itch and kept her temper until the room was empty except for the two of them. When she spoke, it was with a careful, measured tone.

“If you ever undermine me like that again, I will find a way to make everyone in the EMC stop taking your calls. I will isolate you like no one this side of a prison door has ever been isolated. You’ll spend the last days of your life trying to talk interns into getting you coffee.”

“It was a dick move,” Avasarala said, pouring a cup of tea for herself and then another one for Drummer. “It’s my fault. I overreact when I’m scared.”

She hobbled across the room and set the mug down in front of Drummer. An act of submission as calculated as everything she’d done. Whether it was sincere or insincere didn’t matter. She’d kept the form. Drummer picked up the tea, blew across it, and sipped. Because keeping the form was all that was keeping her together now too. Avasarala nodded her approval and went back to her seat.

“I’m scared too,” Drummer said.

“I know. That was some frightening shit that came back from Medina. That ship? I’ve never seen anything like it. I’ve never seen *speculation* about anything like it.” Avasarala picked up her own mug, sipped, and nodded toward the tea. “This is good.”

“We grow it here. Real leaves.”

“All the food chemists in the system will never do better than evolution at making a decent tea leaf.”

“How am I about to fuck up?”

“By trying to get back your losses,” Avasarala said. “It’s not just you either. You’re going to have advisors on all sides who want the same damn thing. Mass a force to reclaim Medina, find a way to coordinate, take the fight back to Laconia. Through a massive effort and at tremendous cost, push our way back to the status quo ante.”

“Sunk-cost fallacy?”

“Yes.”

“So you don’t think—” Drummer had to stop. The words were physically gagging her. She swallowed more tea, the heat of it loosening her throat. “You don’t think we can get the slow zone back?”

“How the fuck would I know? But I do know you can’t get it back as your first step. And I know how much you want to. It feels like if you’re just smart enough, fast enough, strong enough *now*, it won’t have happened the way it already did. But that’s not how it’s going to work. And I know how consuming that grief can be. Grief makes people crazy. It did me.”

It was like the air mix in the room was wrong. Nothing Avasarala was saying was news to her, but the sympathy in the old woman’s voice was worse than shouting. A vast fear, wide and cruel, welled up in Drummer’s gut. She put her mug back down with a click, and Avasarala nodded.

“I was briefed about Duarte, back in the day,” the old woman said. “Mars didn’t want to share anything back then. I thought at the time it was because they’d just been surprise ass-fucked by one of their own, and it was shame. That was true as far as it went, but after I retired, I made him a hobby of mine.”

“A hobby?”

“I’m shitty at quilting. I had to do something,” she said, waving a hand. Then a moment later, “I found his thesis.”

The little book she held out was printed on thin paper with a pale-green cover. It was rough against her fingertips. The title was in a simple font with no adornment: *Logistics-Based Strategy in Interplanetary Conflict*, by Winston Duarte.

“He wrote it at university,” Avasarala said. “He tried to have it published, but it never went anywhere. It was enough to get him a position in the Martian Navy, put him on a career path.”

“All right,” Drummer said, thumbing through the pages.

“After the Free Navy, the best intelligence services in two worlds went over that man’s life in so much detail you could get the Christian names of every flea that bit him. I’ve read ... fuck, fifty analyses? Maybe more than that. It all comes back to those hundred and thirty pages there.”

“Why?”

“Because that’s a plan for Mars to take control of the solar system away from Earth and the Belt without firing a shot. And it would have worked.”

Drummer frowned, opened the book to a random page. *The control of resources can be achieved through three strategies: occupation, influence, and economic necessity. Of these, occupation is the least stable.* A chart on the facing page listed minerals and their locations in the Belt. Avasarala was watching her, dark eyes fixed and penetrating. When she spoke, her voice

was soft.

“At twenty years old, Winston Duarte saw the path that none of his superiors did. That no one on Earth did. He laid it all out, point by point, and the only reason history ran the way it did is that no one took much notice. Then he was a good, solid career officer for decades, until he saw something—an opportunity, maybe—in the data from the first wave of probes that went through the gates. Without changing the time of day when he got his hair cut, he shifted into engineering the biggest theft in the history of warfare. He took the only active protomolecule sample, enough ships to defend a gate, and engineered the chaos that knocked Earth and Mars on their asses.”

“I know all that,” Drummer said.

“You do,” Avasarala said. “And you know what that means. But you’re scared and you’re traumatized and you don’t want to look it in the face because your husband is on Medina Station.”

Drummer picked up her tea and sipped without tasting it. Her stomach felt tight. Her throat was thick. Avasarala waited, letting the silence stretch between them. Saba was on Medina Station. It was a thought she’d been avoiding, and it was like touching a wound.

“Duarte’s good,” Drummer said at last. “He’s very good at what he does. And he came back in his own time and on his own terms.”

“Yes,” Avasarala agreed.

“You’re telling me he won’t overreach.”

“I’m telling you he came back because he thinks he can win,” Avasarala said. “And if he thinks that, you should prepare yourself for the idea that it’s true.”

“There’s no point, then,” Drummer said. “We should just roll over? Put our necks under his boot and hope he doesn’t step on us too hard?”

“Of course not. But don’t talk yourself into underestimating him because you want him to be the next Marco Inaros. Duarte won’t hand you a win by being a dumbfuck. He won’t spread himself too thin. He won’t overreach. He won’t make up half a dozen plans and then spin a bottle to pick one. He’s a chess player. And if you act on instinct, do the thing your feelings demand, he’ll beat us all.”

“Give up Medina. And the slow zone. And all the colony worlds.”

“Recognize that they’re occupied territory,” Avasarala said. “Protect what you *can* protect. Sol system. Reach out where you can, if you can.

There are still people loyal to the union on Medina. And Duarte's intelligence on the last few decades is going to be thin, at least at first. Find angles he doesn't know. But don't take him on straight."

Drummer felt a little click in her heart, the physical sensation of comprehension. Avasarala was making the case for defending Earth. That was why she'd come to her. Drummer and the union, the void cities and the gunships, were critical to keeping Earth and Mars safe. The strategy she was arguing for was all about playing defense, and the thing Drummer would be defending was, in the final analysis, the inner planets. That's what she and her people would be asked to die for: Earth and Mars and all the people who'd made their civilizations on the back of the Belters back in the days before the union. It wasn't just strategy. It was naked self-interest.

Also, it was right.

Medina was behind enemy lines now. And Drummer wasn't going to be able to take it back. That didn't mean she was powerless.

"So," she said, "what do we have to work with?"

"The coalition fleet," Avasarala said. "The union fleet. And whatever agents we can coordinate with on Medina."

"We can't reach anyone on Medina," Drummer said. "The communications channels are all under Duarte's control."

Avasarala sighed and looked at her hands. "Yours are," she said. It took a moment for Drummer to understand.

Avasarala shrugged. "Everyone spies on everyone, Camina. Let's not pretend to be outraged at water for being wet."

"You have a way to get messages to Medina?"

"I didn't say that," Avasarala said. "But I know a *lot* of people."

Chapter Fourteen: Singh

There have been significant changes to the internal structure of the station,” Colonel Tanaka said. “Not that surprising. This was all supposed to be a generation ship that spun at a full g for a few centuries. Now it’s a waystation at a third. A lot of the infrastructure would want rethinking, and there’s never been a Belter ship that didn’t get modified to suit the moment. If they hadn’t purged their security and maintenance databases, we’d know a great deal more. But there’s nothing lost there we can’t build back, given time.”

“I see,” Singh said, considering the possible methods of recapturing the lost data.

“In addition, we’ve recovered one thousand two hundred and sixty-four firearms in our sweeps, the vast majority of which were handguns,” she said, scrolling through a list on her monitor. “Areas with complex compounds that can easily be used in bomb making are under strict security watches, but we’ll need to make some extensive redistribution and security changes before everything can be effectively locked down.”

“Anything else?” Singh asked.

“They still have kitchen knives and power tools. And anything we missed.”

Tanaka was out of her power armor, and her long, lean form was insolently stretched out across a chair in Singh’s office. She was older than him by almost two decades, and he could see her reaction to his relative youth in the way she held her shoulders and the shape of her smile. She playacted respect for him.

The office—his office—was small enough to be functional. A desk, chairs, a small decorative counter with its own bar. The workspace of an important administrator. He’d taken over a complex that had once been accounting space, based on the names and titles they hadn’t scraped off the doors yet. The ops and command decks, like engineering and the docks,

were in the part of the station that was permanently on the float, and he found the idea of working in null g uncomfortable. And more than that, he'd seen from Duarte and from Trejo what a real commander's space looked like, and it looked humble.

He went back to the issue that bothered him most.

"Twelve hundred guns? There were less than a hundred security personnel on the whole station."

"Belters have a long tradition of not trusting governmental authorities to protect them," Tanaka replied with a shrug. "Nearly all of these weapons were in civilian hands."

"But the Belters *are* the government here."

"They're Belters," she said, as if her experiences before Laconia explained everything that was happening now. "They resist centralized authority. It's what they do." She gave the report one last glance, then slapped the monitor against her arm, where it curled up into a thick bracelet.

"I have meetings today with their 'centralized authority,' so that should be illuminating," Singh said, surprised at the contempt in his voice. Tanaka gave him a little half smile.

"How old were you during the Io campaign?" she asked.

It felt like a bit of a dig. He remembered the Io campaign the way most children in his generation did. The newsfeeds announcing the launches toward Mars. The gut-clenching fear that one of the missiles bearing the alien hybrids would make it as far as the Martian surface. Even after the crisis had passed, the weeks of nightmares. He'd been a child then, and the memory had the near-mythical feel of a story retold until it barely resembled its truth. Those terrible days that had convinced his parents that something more would have to be done to protect humanity from itself and its new discoveries. It had planted the seeds that bloomed under the skies of Laconia.

But bringing up his age now felt like a power play. A way to point out how little experience he had. He tried not to show that it got under his skin.

"Not old enough to think of it as the Io Campaign, though of course I'm thoroughly versed on the history."

"I was a JG when that shitstorm went down," Tanaka said. "We were actively fighting with Belter factions back then. You probably think these people are a half step up from spear-carrying savages—"

"I don't—"

“And you’d be right,” she continued. “They can be the most stupidly stubborn people you’ll ever meet. But they’re tough as nails, and resourceful.”

“I think you misunderstood me,” Singh said, fighting to keep a flush out of his cheeks.

“I’m sure,” Tanaka said, then stood up. “I have an interview with the technical-assessment crew. I’ll report in when I’m done with them. In the meantime, don’t leave this office without your monitor on. Security directive.”

“Of course,” Singh said, the flush of shame he’d felt shifting over into anger. Personnel security fell under Tanaka’s operational command while they were occupying the station. It was one of the few areas where Singh could not countermand her orders. So, after dressing him down and questioning his understanding of their situation, she was now delivering a direct order. The humiliation stung.

“Appreciated,” she said, and headed for the door.

“Colonel,” Singh said at her back. He waited until she’d turned to look back at him. “I am the provisional governor of this station, by direct order from High Consul Duarte himself. When you’re in this office, you will stand at attention until I offer you a seat, and you will salute me as your superior. Is that understood?”

Tanaka cocked her head to the side and gave him another of her enigmatic little half smiles. It occurred to Singh that Aliana Tanaka had risen to the rank of colonel in the most punishingly trained combat unit humanity had ever known, and that he was alone in his office with her. He wanted to look down at her legs, see if she was rolling up onto the balls of her feet or shifting her stance. Instead, he stared her in the eye and clamped his stomach down into a knot. If he was supposed to be kind and humble, to ask about her family and trade familiarities with her, he was doing a poor job of it.

“Sir,” Tanaka said, coming to attention with a sharp salute. “Yes, sir.”

“Dismissed,” Singh said, then sat down and looked at his monitor as though she’d already disappeared. A moment later, his door opened and then closed.

Only then did he collapse back into his chair and wipe the sweat off his face.

“Give me one reason we don’t tell you to go fuck yourselves,” the head of Medina Station’s Air, Water, and Power Authority said. “The AWP—”

“The AWP works for us now,” Singh replied, keeping his voice level.

“Like hell we do.”

It’s shock, Singh told himself. It’s surprise and confusion and sorrow that the universe doesn’t behave the way they thought it did. And everyone on Medina Station—maybe everyone on the colonies and in Sol system too—was going to be struggling with it. All he could do for them was keep telling the truth, as clearly and as simply as he could, and hope it sank in.

“You do,” Singh continued. “And if you do not order your workers to resume their duties, I will have technicians from the *Gathering Storm* take over for them, and then I will have every single member of your organization arrested.”

“You can’t do that,” the AWP chief said with bravado, but he rubbed his bald head, and his expression wasn’t as certain.

“I can,” Singh said. “Everyone on your staff is back at work by next shift rotation or I start issuing arrest orders.”

“You won’t—”

“Dismissed,” Singh said, then gestured at one of his Marine guards, who ushered the AWP chief out of the room. Putting Medina Station in order was messy. He had imagined, coming out, that as governor of the station, he would be kept apart from the normal rank-and-file citizens and laborers. That he would have a status that kept those around him a little more in awe, with underlings to deal directly with the hands-on administration. In practice, Admiral Trejo had the role of power, and he was the underling. He accepted it with good grace. It would all be more pleasant in a few months, when the new defense emplacements were complete and the *Tempest* could progress to the next phase of their mission.

The briefings he’d had on the way out—all information gleaned from passively monitoring the backslash radio that leaked through Laconia’s ring gate—were accurate, but wildly incomplete. It left him feeling a half step behind himself all the time. It wasn’t even the basic structures—those were constrained by the biological and energetic needs of the ships and station and so were, in a sense, predictable. It was the cultural forms and

expectations. The absurdities and accidents of human character that affected the flow of goods and information in ways that were as unpredictable as they were exhausting. Like having to throw an entire branch of Medina's infrastructure staff in the brig.

"Who's next," Singh asked his aide, a junior lieutenant named Kasik he'd grabbed from the admin pool on the *Storm*. Kasik scrolled through a list on his monitor.

"You have Carrie Fisk next," Kasik said.

"The president of the Association of Worlds," Singh said with a laugh. "Bring her in."

Carrie Fisk entered his office, her frown lines and fidgety hands telling Singh she'd be trying to hide her fear with anger. She was a short, thin woman, with a severe face and beautiful black hair piled up on her head. Her clothes were expensive. Someone from one of the richer colonies, then. He knew her from the newsfeeds they'd captured. She looked thinner and less pleasant in person.

Singh gestured at the chair across from his desk and said, "Please sit, Madam President."

She sat, the anger dissipating at his politeness.

"Thank you."

"Madam President, I have news," Singh said, flicking a document from his monitor at her. The hand terminal in her pocket chimed. "And it will be good news or bad news, depending on how seriously you take your job, and how much you like doing actual work. You may read that later, to get all the details."

She'd started to take the terminal out of her pocket, but slid it back in at his words. "I take my job very seriously."

"Excellent, because it seems you used to have a title that held no actual power, except that you presided over the Association of Worlds in their meetings here. Which is a body that negotiates interplanetary laws it has absolutely no ability to enforce. Earth and Mars haven't formally joined your coalition, and the Transport Union has been in a position to dictate terms in all your agreements. Or so I am led to understand. My access to the newsfeeds has been limited." He tried for a self-deprecating smile, and thought he probably got about three-quarters of the way there.

"It's a start," Fisk said, the frown returning to her face. "At least we have people here talking out their problems, rather than immediately

reaching for a gun.”

“I agree,” Singh said. “And more importantly, so does High Consul Duarte. The document I just sent you empowers the Association of Worlds to make laws that will have binding authority on the member systems, which now includes every human colony. You, as president of that body, will be granted a variety of legislative powers to aid in that cause.”

“And who is granting us this new power?” Fisk asked. Her face had twisted up like he’d asked her to eat something distasteful. She knew the answer to his question, but she wanted him to say it so that she could begin her counterargument. A counterargument Singh had no interest in entertaining.

“High Consul Winston Duarte, who is now the supreme executive authority of the Association of Worlds and all subsidiary governments. All edicts passed by this body that are not vetoed by executive power will have the force of law, backed by the military power of Laconia.”

“I don’t know if—”

“Madam President,” Singh said, leaning forward and waiting until her attention was fully on him before he continued. “I advise you to take this very seriously. The high consul wants a fully functioning legislature and bureaucracy, and believes that the existing one, with some modification of course, fits the bill. I strongly advise that you not give him a reason to think it’s better to tear this down and build something new in its place. Do we understand each other?”

Fisk nodded. Her hands were fidgeting in her lap again.

“Excellent,” Singh said. He stood up and extended his hand. Fisk stood and took it. “I look forward to working with you as High Consul Duarte’s representative. We have much to do, but I believe it will be exciting and rewarding work.”

Singh released her hand and gave a small bow.

“What comes next?” Fisk asked.

“I would recommend you begin by familiarizing yourself with the document I sent you. It contains all the provisional rules for the Association Legislature, until such time as more permanent protocols can be voted into place.”

“Okay,” Fisk said.

“I know you will be quite busy,” Singh told her, gently guiding her past his Marine guards and over to the door. “But I look forward to our next

meeting.”

Once she’d left, he let out a long sigh and leaned against the wall.

“One more, Lieutenant, then we can break for lunch,” he said.

“Yes, sir,” Kasik said. “Next is Onni Langstiver, head of station security for Medina.”

Singh smiled a little, thinking how Tanaka would have reacted to hearing that title. “*Former* head of security,” he said as he returned to his desk. “Give me a moment. Let him wait.”

“Yes, sir,” Kasik said. “Can I get you anything in the meantime? Water? Coffee?”

“The water here tastes like old piss, and the coffee tastes like old piss run through a gym sock,” Singh said. “The recycling systems on this station are decades out of date and badly maintained.”

“Yes, sir,” Kasik replied. “I can have water brought from the *Storm* for you.”

“Or,” Singh said, turning to his aide, “we can go about actually fixing the problems here.”

“Yes, sir,” Kasik said, bobbing his head. If Singh hadn’t been tired already and irritable, he would have let it sit there. But the constant pushing back from his own people and the natives of Medina had scratched him enough to raise welts, and he couldn’t quite rein himself in.

“If the posting here becomes permanent,” he said, “and there is no reason to think it won’t, I will be bringing my family to this station. I won’t have my daughter drinking badly recycled water, breathing badly filtered air, and attending badly run schools.”

Kasik had found a bottle of water from somewhere, and was pouring it into the coffee machine.

“Yes, sir,” he said, like it had become an autonomic reaction.

“Lieutenant, look at me.”

“Sir?” Kasik said, turning around.

“What we’re doing here is important. Not just for Laconia but for all of humanity. These people? They need us. They even need us to show them *that* they need us. When you have children, you’ll understand why that matters. Until then, you will behave at all times as an example of Laconian character and discipline. If you don’t understand why that’s critical, you will *act* as though you understand, or I will place you in charge of personally scrubbing the water-recycling system until it produces

laboratory-grade potables. Are we clear?”

If there was a flicker of resentment in the man’s eyes, it was a natural reaction to discipline.

“Crystal, Governor Singh.”

“Excellent. Then send their former head of security in.”

Onni Langstiver was a lanky Belter type in a sloppy Medina Security uniform, with greasy hair and a permanent sneer curling his lip. He looked over Singh’s Marine guards just inside the door, then gave Singh himself a look of such low cunning that he almost had the man turned back out again.

“I’m here,” Onni said. “You want, bossman?”

“We’re going to discuss your change in status on this station,” Singh said.

“Discuss? Bist bien. Let’s discuss.” Onni shrugged, then walked toward the guest chair.

“Do not sit,” Singh said. Something in his tone brought Onni up short, and the man frowned at him as if really seeing him for the first time. “You won’t be here long.”

Onni shrugged again, a short lift of both hands that did not involve the shoulders. The psy-ops briefing on Belter culture had talked about this. That most of their physical gestures had evolved to use the hands only, because they spent so much time in vacuum suits that body language was invisible. It also talked about their cultural conviction that they were the put-upon victims in all interactions with non-Belters. Well, if this Onni had come into the room expecting to be victimized, Singh would oblige him.

“You are no longer the head of security on Medina Station,” Singh said.

“Who’s the new boss?” Onni replied. He wasn’t angry, which was interesting.

“It doesn’t matter to you,” Singh said with a smile. “Because you no longer work for station security. In fact, you no longer hold any official duties of any kind on this station. The last official task you will perform is to hand over all personal files related to this station that are not in the official database. Failure to do this will result in arrest and prosecution by a military tribunal of the Laconian Navy.”

“Sure, sure, jefelito. Only you know most that’s gone. Purged,” Onni said.

“What you have, you will surrender.”

“You’re the man now.”

“You may leave.”

A smile passed over Onni’s face, soft and ingratiating. Singh had seen this before, from the playground to the academy. He’d seen it as a boy in the eyes of the science team that had been on Laconia when Duarte’s ships arrived and on the football team when the woman who’d been their coach was reassigned and a new man stepped in. Respect for power, yes, but also the scent of opportunity. The opportunism of making good with the new powers.

“One thing, bossmang,” Onni said, as Singh had known he would.

“No, not one more—”

“No, no, no. Wait. You’ve got to hear this one.”

“Fine,” Singh said. “Out with it.”

“So that weapon your big ship used? The magnetic one?”

“The *Tempest*. Yes, what about it?”

“Yeah, so,” Onni said, then paused to scratch his greasy hair and smirk. “When you hit the hub station with it? Where the rail guns were?”

“Yes,” Singh said. “We have extensive experience with similar artifacts, and judged the risk to be minimal.”

“Okay. So when that beam thing hit the hub station that pinché ball glowed bright yellow for que, fifteen seconds. Anytime anything hits the ball that dumps any energy into it, you get these little flashes of yellow. This is the first time the whole damn thing lit up, and fifteen seconds is a long time.”

“I’m having trouble understanding your point,” Singh said.

“So during that fifteen seconds, all thirteen hundred rings dumped a massive gamma-ray burst into their systems. Hard enough that four ships on approach to the rings had their crews cooked. Emergency systems kicked in, autopilot stopped the ships, so we don’t have four unmanned projectiles flying through the rings at us, but ...”

Onni lifted his hands as if he was presenting a gift. Singh blinked and sat back. Something shifted in his belly. An emotion he hadn’t felt since he’d arrived at Medina. Surprise. Maybe even hope. The ring space was, by the best understanding of the science teams, one of the most energetically active things in the perceivable universe. The power required to keep the space itself from collapsing was astounding even to people who routinely built things like *Magnetar*-class battleships. The effect Langstiver described wouldn’t even be a rounding error in the overall system, but the application

of it could mean a significant windfall.

“How do you know this?”

The Belter spread his hands. “I live here. I know things not everybody knows.”

“Is this correct?” Singh said, not to Onni but to Kasik.

“I’ll have a report prepared immediately,” Kasik replied, and left the room already talking at his wrist.

“So, yeah,” Onni continued, laughing a little now. Acting as if he’d already ingratiated himself. If he wasn’t corrected, it would become true. “Transport Union’s gonna be pissed you just cooked four of their freighter crews.”

Singh considered the man. He would need local contacts. Natives of Medina Station who were loyal to the new power structure and supporters of Laconian rule. The prospect of having this bootlicker as one of the first among them was beneath his dignity.

“Dismissed,” Singh said to the man. He needed to call Trejo on the *Tempest* and report this.

Onni’s face fell. The smile faded first into surprise and then indignation and resentment. Rejection bloomed into hatred while Singh watched. He’d rarely made a decision proven right so definitively or so quickly. People of this low character would never be part of his administration, and it was telling that Onni had managed to gain power on Medina.

“Bossman, you gotta listen to me,” Onni said.

“I said you’re dismissed,” Singh barked at him, then looked to one of his Marine guards. She immediately grabbed Onni by the arm, halfway lifting him off the ground with her armor’s augmented strength.

“Ouch! Fuck!” Onni yelled as she dragged him out of the room.

“Have a cart brought around,” Singh said to the remaining Marine. “I want to go to the ops center and look over the data about this gamma-ray burst.”

“Aye, sir,” the Marine said, then stepped out of the room.

Singh needed to corroborate Onni’s story first, then get a full report to Admiral Trejo. If the man was correct, then they had the ability to release a lethal gamma-ray burst through the gates whenever they wished. Could there be a more powerful means of controlling travel through the network? It had the potential to shave *months* off their timetable in establishing control over the various colony worlds.

For the first time that day, Singh felt himself relax. He might have just won the empire for Laconia, all without firing a shot in anger.

Chapter Fifteen: Bobbie

As an operator in the Orbital Drop Task Force, Bobbie had trained with Spec Ops personnel from every command in the Martian military for a single purpose: the invasion of Earth. And while the old axiom “If you wish for peace, prepare for war” was not without its skeptics, that skepticism wasn’t shared by the Martian military. The doctrine that drove Mars in the century and a half following its declaration of independence relied on it. Mars would never have as large a population or as big an industrial base as Earth. The only thing that prevented Earth from reconquering her wayward colony was a constant demonstration of Mars’ willingness and ability to hit back hard. As long as they could land on Earth streets, Earth would hesitate to fight in their tunnels.

Bobbie and her fellow Marines in Force Recon regularly and visibly trained for that day. They took drugs and worked out in full gravity until Earth would be merely uncomfortable, not bone-crushing. They practiced dropping from orbit in troop carriers and one-person pods. They trained in urban pacification and insurgent elimination. They learned to make up for what they lacked in troop numbers by using aggression and intimidation to keep the conquered people in line. She had literally spent years preparing to move through the streets of Earth commanding obedience through the threat of death.

The invasion and conquest of Medina Station was civilized by comparison. She wondered whether that would last.

Four Laconian Marines in their power armor stood watch in the dock offices, mag boots locked to the deck, and kept a close eye on the line of people waiting to talk to the dockmaster. But while they appeared vigilant, they were not aggressive. They acted like their presence was sufficiently intimidating to keep the populace in line. With some sort of slug thrower built into the armor in each forearm, and a pair of what looked like grenade launchers on each shoulder, Bobbie decided they were right. There were

probably thirty people on the float waiting for the dockmaster. The four Laconians looked like they could have handled ten times that number.

She'd been like them, once.

"I like your suit," she said to the Laconian closest to her.

"Excuse me?" he said, not looking at her, continuing to scan the room.

"I like your suit. I wore an old Goliath back in the day."

That got his attention. The Laconian looked her over once, feet on up. He was so much like the teams she'd trained with when she'd joined up, it felt like looking back through time. She wondered if he was as ignorant as she'd been back then. Probably. Hell, maybe more so.

"MMC Force Recon?" he said. There was something like respect in his voice.

"Once was," she agreed. "You guys have made some improvements."

"Studied the Recon operators at the academy," the Laconian said. "You guys were the real deal. Heart breakers and life takers."

"Less and less of both, as time goes on," Bobbie said, and tried out a smile. The Laconian smiled back. He was half her age, at most, but it was nice to know she could still pull 'em when she wanted to. She could have imagined the kid on the tube station back at home. Shit, he probably had family back on Mars.

"I bet you do okay," he replied, still smiling. "You see any action?"

She smiled back, and the kid realized what he'd said. A little blush touched his cheek.

"Some," Bobbie said. "I was on Ganymede in the lead-up to the Io Campaign. And I was on Io."

"No shit?"

"I don't suppose there's any way an old Marine could try one of those suits out, is there?" Bobbie said, ratcheting the smile up a notch. *I don't use sex as a weapon*, she thought to herself. *But I'd love to get my hands on your outfit.*

The Laconian started to reply, then got a distant look on his face that Bobbie recognized. Someone on the group comm was talking in his ear.

"Move along, citizen," he said to her, the smile gone.

"Thanks for the time," she said, then pulled herself to the back of her line.

The wait was long and uncomfortably warm. The others there with her had flight-suit patches from a dozen other ships, and the same hangdog

expression. It was like they were being treated this way because they'd done something to deserve it. Bobbie tried not to look like that.

The dockmaster's office was small and harshly lit. She identified herself and her ship, and before she could give any context, the new dockmaster cut her off.

"As a military vessel, the Ceres-registered ship called *Rocinante* is now impounded by the Laconian Naval Command." He was a small, dark man in a Laconian naval uniform, and the look on his face was the mix of boredom and irritation shared by all natural-born bureaucrats. A screen on the wall listed all the ships in the slow zone and their statuses: LOCKDOWN in red, over and over again like it was a mantra. The counter in front of him glowed with the name CHIEF PETTY OFFICER NARWA.

"Okay," Bobbie said. She'd waited in line for nearly two hours to get up to the window, and she certainly hadn't done it to be told things she already knew. Behind her, the press of bodies was enough to give the office a little extra warmth, the air a little too much closeness. "I understand that. But I have questions."

"I feel like I've told you everything you need to know," Narwa said.

"Look, Chief," Bobbie said, "I just need to get a few clarifying details and I'm out of your hair."

Narwa gave her a delicate shrug of his shoulders. If there had been any spin gravity, he'd have leaned on the counter. He looked like a guy who ran a noodle shop in Innis Shallows. She wondered if they were related.

"I own that ship," Bobbie continued. "Is this a permanent impound? Are you commandeering it? Will I be paid any compensation for the loss of the ship? Will I or my crew be allowed on board to get our personal effects if the ship is being confiscated?"

"A few points?" Narwa said.

"Just those," Bobbie agreed. "For now."

Narwa pulled something up on the counter and flicked it over to her. She felt her hand terminal buzz in her pocket.

"This is the form you can fill out to file for return of property or compensation for the loss of the ship. We are not thieves. The navy will provide one or the other."

"What about our stuff," Bobbie asked. "While the naval wheels of justice slowly turn?"

"This form," Narwa said, and her terminal buzzed again, "is to get an

escorted pass onto the ship to get your personal items off it. They're usually processed within forty-eight hours, so you shouldn't have to wait long."

"Well, thank—" Bobbie started, but Narwa was already looking at the person behind her in line and yelling, "Next."

"Any word from Holden and Naomi yet?" Alex asked.

"Not yet," Amos said, tapping his hand terminal with a thumb. "System's pretty loaded up right now, though. May be getting stuck in queue."

"They have it in lockdown," she said. "There's not going to be free comms on Medina that aren't getting scanned by their systems."

"Sounds like that could add some time to delivery," Amos said.

"Standard occupation protocols care a lot more about security than convenience," Bobbie said. "Message tracking, air-gapped encryption, pattern-based censorship, human-review censorship, throttled traffic. You name it."

It fit with everything else that was suddenly changed and beyond her control. She couldn't have her ship. She couldn't get her people back together. She had to ask permission and an escort to let her retrieve her own clothes. So of course their messages were getting stuck in Medina's system. They'd found a bar on the inner face of the drum. The long ramp from the transfer point at the center of spin had been thick with carts and people on foot, some heading up toward the docks, and many—like them—coming back down. The grim expressions had been the same both ways.

"I was captain for about a week," Bobbie said, the beer in her cup sloshing dangerously as she jabbed at the air with it. "I mean, depending on if you count from when Holden offered it to me. Or when we did the paperwork. The paperwork came later, so *officially*, I guess. Houston clocked as much time in control of the *Rocinante* as I did."

"You're drunk," Alex said, gently pushing her beer hand back down to the table. He was sitting next to her at a long, faux-wood table. Amos and Clarissa sat across the table from them. Amos had a beer in his hand and half a dozen empties on the table and didn't appear impaired in the slightest. Clarissa had a plate of cold, soggy french fries in front of her and was using

them to push ketchup into spiral art.

"I'm a little drunk," Bobbie agreed. "I was just starting to like the idea of being captain of my own ship and these Laconian assholes took it away."

She punctuated the word *Laconian* by jabbing her glass toward one of their Marines walking past the bar. Beer splashed across the table and into Clarissa's fries. She didn't seem to notice or care. Bobbie plucked up her napkin and dabbed the worst of it away anyhow, with only a little pang of guilt.

"And that's why you need to ease down on the brews, sailor," Alex said, just taking the glass away from her now. "We need to skip past this grief stage and get on to the kickin'-ass and gettin'-our-ship-back stage."

"You got a plan?" Amos asked. His tone said he found this dubious.

"Not yet, but that's what we need to be doing," Alex shot back.

"Cuz, a couple hundred Marines, one destroyer in the docks, and one whatever the fuck that flying violation of the laws of physics is," Amos said, pausing to sip his beer and smack his lips. "That's gonna be one hell of a plan. I gotta get in on that action."

"Hey, asshole," Alex said, half standing up from his chair. "At least I want to do something more than feel sorry for myself."

"This here?" Amos said. He pointed at the Marine outside, the security drones that now hovered over every part of Medina's drum, the people in Laconian Navy uniforms everywhere. "I've seen this before. This is us getting paved over. All we can do now is try to find some cracks to grow through."

"Cracks?" Alex said, then sat back down with a thump. "How long I known you? Half the time I still got no idea what the fuck you're talking about."

"No one is doing anything," Bobbie said. "Not till I give the order. We get this pass to get our stuff off the *Roci*, maybe we can start making a strategy from there. I may not have a ship, but I can sure as hell still have my crew."

"Be nice to sneak a gun or two off the ship," Amos agreed.

"Be nicer to find a way to get Betsy off," Alex said to her. "If that's possible."

"So until then, we wait," Bobbie said, then started pressing on the table trying to order another beer. "I just wish I understood what this Duarte asshole wants."

“They haven’t started killing people,” Amos said. “I mean, it’s still early days. Lots of room for shit to go pear-shaped.”

“But why now?” Bobbie waved her arms around at the bar, at Medina, at all of human space beyond them. “We were *just* starting to figure this shit out. Earth and Mars working together, the colonies talking out their problems. Even the Transport Union turned out to be a pretty good idea. Why come kick the table over? Couldn’t he have just pulled up a chair with the rest of us?”

“Because some men need to own everything.”

The voice was so quiet, it took Bobbie a moment to realize Clarissa had spoken. She was still making ketchup art with her french fries and not looking at any of them.

“What’s that, Peaches?” Amos said.

“Some men,” Clarissa replied, louder and looking up at them now, “need to own everything.”

“Hell, I *met* this Duarte guy,” Alex said. “I don’t remember him being —”

“This sounds like personal experience,” Bobbie said, cutting him off. “What are you thinking, Claire?”

“When I was a little girl, I remember my father deciding to buy up a majority share in the largest rice producer on Ganymede. Rice is a necessity crop, not a cash crop. You’ll always sell everything you can grow, but the prices aren’t high, because it’s easier to grow than a lot of other things. And at that time, his companies had an annual revenue in excess of one trillion dollars. I remember an advisor telling my father that the profits from owning rice domes on Ganymede would add a one-with-five-zeroes-in-front-of-it percent to that.”

“Not sure I—” Alex started, but Clarissa ignored him, so he trailed off.

“But the largest food producers were the rice growers. They had the biggest domes and farms. The most real estate. By owning a controlling share in their company, my father was in a position to dictate policy to the Ganymede Agriculture Union. It meant, in terms of Ganymede food production, he couldn’t be ignored by the local government.”

“What did he use that for?” Bobbie asked.

“Nothing,” Clarissa said with a delicate wave of one hand. “But he had it. He owned an important piece of Ganymede, a thing he hadn’t controlled before. And some men just need to own everything. Anything they lay their

eyes on that they don't possess, it's like a sliver in their finger."

Clarissa pushed her soggy fries away and smiled at them all.

"My father could be the kindest, most generous and loving man. Right up until he wanted something and you wouldn't give it to him. I don't know why I think this, but Duarte feels the same. And these are men who will mercilessly punish anyone who won't comply, but with tears in their eyes and begging you to tell them why you made them do it."

"I knew a few guys like that," Amos said.

"So, he won't stop until he has it all," Bobbie said. "And it looks like he has the tech to make it work. The armor, that destroyer, and that planet killer floating outside. All of this? They all look like they came out of the same factory to anyone else?"

"Yeah, it's protomolecule shit," Amos agreed. "Some of it looks like the stuff growing on Eros."

"I'm seeing a timeline here," Bobbie said.

"We were looking into those missing ships when I talked to this Duarte guy," Alex said. "It was about the time Medina was throwing a lot of probes through the gates to get a gander at the usable planets."

Bobbie finally got the ordering screen to come up on the table, but on impulse bought a glass of club soda instead of another beer. It felt like something important was on the tip of her mind, and she didn't want to drown it in booze.

"So," she said, letting the words come out of the back of her head, hoping her subconscious had an insight it hadn't shared yet. "A probe finds something in the Laconia system, something that makes ships and armor and who knows what else."

"What, like a big volumetric printer that says, 'Insert protomolecule here' on the side?" Amos scoffed.

"Hey," Alex replied, "we found a planet-sized power generator with moons that could turn off fusion."

Amos considered that for a moment. "Yeah. Fair enough."

"Marco's people are running a fifth column on Medina by that point," Bobbie continued. "Duarte must have been working with them already. Said he'd slip them a fat payday for early info on the ring probes. They call him up and say, 'Hey, we found this awesome thing.'"

"He hands them a bunch of Martian ships," Alex said.

"And Marco starts fucking up the solar system while Duarte takes the

rest of his fleet and a bunch of like-minded Martians and takes over in Laconia,” Bobbie finished.

“Where he spends a few decades making ships and fancy armor and whatnot, then rolls through the gate ready to name himself king,” Alex said as her club soda arrived.

“Which means Marco was just a tool,” Bobbie said.

“Kind of knew that,” Amos chimed in.

“Free Navy kept everyone distracted while Duarte got set up on Laconia. And we’ve been sitting here patting ourselves on the back and trying to keep all the food supplies where they need to be for thirty-odd years while he’s been getting ready to kick the shit out of us,” Bobbie said. “Alex, maybe you should write up your thoughts on meeting him. What kind of guy he was.”

“I sat in his office for a few minutes. There are probably some people on Medina who served around the same time he did,” Alex said. “If we can find where the Martian vets hang out, we could see if anyone knew him.”

“Yeah, that’s a good—” Bobbie started, then stopped when she noticed Amos stiffen in his chair. The big mechanic’s hand drifted toward his right hip and the gun that was no longer there since the Laconian weapon sweeps.

“Amos?” she said.

“Trouble on the move,” he replied with a gentle tilt of his head.

The people he’d nodded toward were a group of Belters, old-school OPA by the tats. They were walking through the drum section nearby. They wore coats too large and heavy for the constant perfect weather of Medina’s drum section, and several carried large bags. They kept their heads down and moved fast, like people with a purpose. She recognized one of them. Onni Langstiver, the asshole head of security.

“What’s over there?” Bobbie asked.

“Some offices? The banking section, and some administrative stuff,” Alex replied.

“The Laconians took it over,” Clarissa added.

“Here we go,” Amos said, and stood up. In the distance, the Belters were pulling things out of their coats and bags. Bobbie felt the surge of adrenaline in her blood the same moment as the calm descended on her: danger followed immediately by the well-cultivated response to danger. It felt like being home.

Bobbie looked around the little bar for likely cover. Nothing within ten steps looked like it would stop a bullet, so she grabbed Alex with one arm and Clarissa with the other and pulled them both to the ground with her. Amos was still standing up, watching the drama play out.

“Get down, you idi—” Clarissa started, but whatever else she was about to say was drowned out by the gunfire.

Chapter Sixteen: Singh

As he stepped out of the office complex, Singh made the mistake of looking up. The thin line of blazing full-spectrum light that ran down the center of Medina's habitat drum blinded him, just a little. It cut a glowing streak across his vision, and filled his eyes with tears. Like looking into a sun, if instead of an orb several light minutes away, it was a line drawn in the sky and very close.

"Hold on a moment," he said to his Marine escort, as he tried to get his vision back.

"Copy that," the Marine replied, then said, "we're oscar mike, triphammer two minutes from the cart. Rolling teams for cover to station ops."

It took Singh a moment to realize that most of that was comm chatter to his security detail. He had nothing but respect for the Marines under his command and for the security they provided, but they did love their jargon and code names. A moment later he'd shaken most of the water out of his eyes, and the yellow-green afterimage line across his vision was fading.

"Okay, I'm ready."

"Copy that," the Marine replied, and pointed to a parking area about fifty meters away with three electric carts lined up and waiting. Lieutenant Kasik was hurrying toward him from the carts, waving a monitor that had been extended to its full size. He met them a few seconds later, puffing with exertion.

"I have the initial defense reports," Kasik said, handing the monitor to Singh.

"Excellent." Singh scrolled past a spreadsheet of incomprehensible numbers. "I hope there's a summary?"

"Yes, sir, and the tech group is waiting for you in station ops to answer any questions. But the initial findings are very exciting."

"Tell me."

“What we can see,” Kasik said, “is the ring system converted all of the energy from the *Tempest*’s field projector into gamma rays released through the rings.”

“We knew that,” Singh replied with a frown.

“But ... the energy released was orders of magnitude more than the energy the central sphere absorbed. The ring system amplified it. Exponentially. If the factor is consistent, we can create predictive models for input versus output very quickly.”

It was exactly what he’d hoped. The alien rings could be made into their own defenses, and the reconstruction of the defense battery skipped entirely. The *Tempest* would be free to move into Sol system months ahead of the original plan. Any attack would fail, even if it were coordinated through every ring at once. One *Magnetar*-class battle cruiser could guard thirteen hundred gates at once and never miss its shot. The battle to seize control of every human-controlled world in the galaxy was already over.

After that, it was just administration of the new empire. Singh tried to imagine the high consul’s pleasure, the possible rewards, and his imagination failed him. But one thing still bothered him.

“Why was it, Kasik, that we heard about this from a local? If this had gone overlooked—”

“I’m sure we’d have found it, sir. But we weren’t looking at the logs. We have additional data in Operations,” Kasik said. “And I’ve requested technicians for more analysis.”

Singh realized his daydreaming of the high consul’s patronage had stretched into an awkward pause. Before he could reply, something shifted at the edge of his vision. Someone walking toward him with the purposeful stride of a messenger making a delivery. Except that the person striding toward him was Langstiver. The man who’d brought him the news of the new and glorious discovery. A small group of Belters were following him. He assumed Langstiver was coming to demand a reward for his information.

“I don’t want—” Singh began, but his Marine guard had put one hand on his chest and shoved him back. Kasik nodded at him sharply one time, then spit berry-colored saliva all over his face.

The Marine yanked Singh to the ground, hard, then knelt over him, shielding him with her body. Her knees pressed into his spine until it hurt. Singh heard her shouting orders, muffled by her helmet, to the rest of her

detail. And then he heard nothing but the deafening ripping-paper sound of multiple rapid-fire weapons opening up. His guard was sitting on top of him and blocking his view, but the space between her thigh and calf as she crouched created a small triangular window on the carnage.

Langstiver and half a dozen other people were dancing backward as four Laconian Marines cut them to pieces with streams of high-velocity plastic safety rounds. It felt like the firing went on forever, like the bullets were keeping the assassins from falling. In reality it could only have lasted a few seconds. He experienced a little discontinuity in his consciousness, like he'd fallen briefly asleep, though that was impossible, and his Marine had yanked him to his feet and was shoving him back toward the administrative offices. The other members of her fire team slowly backed toward them, weapons at the ready.

Lieutenant Kasik still stood near the carts, not having moved during the entire firefight. He looked like he'd spit raspberry pie filling onto his lips, and he was twitching like an epileptic experiencing a grand mal. Singh understood something that had been eluding him.

"Kasik's been shot," he said. The pie filling on his face was the ruins of his lips from where the bullet had exited. The spray of red on Singh's face and uniform wasn't spit, it was his aide's blood.

"Medical has already been alerted," his Marine said, thinking he was talking to her.

"But no," Singh said. She didn't understand. "He's been *shot*."

She shoved him through the admin-building door and slammed it shut behind her. Just before it closed, the shocked silence that had followed the gunfire ended, and from a hundred voices outside the screaming started.

Kasik died on an operating table three hours after the attack. According to the report, he'd been shot in the back of the head, the bullet fracturing the occipital lobe of his skull and nicking his medulla oblongata. It then passed through the back of his throat and nearly severed his tongue, before shattering five teeth and exiting through his lips. Singh read the surgeon's section of the incident report half a dozen times. Each time felt like the first.

None of the Marine security detail had been harmed in the exchange of fire, though several civilians had received minor injuries from bullet fragments, and one boy of nine had broken his arm while attempting to flee down a short flight of steps. All seven of the Belter radicals who'd attempted the assassination were dead. The intelligence people were

digging into their past associations to see if the rebellion had roots that spread farther.

Rebellion.

The word felt wrong to Singh. The most Langstiver and his accomplices could have hoped for was his death. It would have done nothing to hand control of the station back to the Belters who'd once run it. Trejo would simply have assigned another officer to fill his place until a new governor could be dispatched from Laconia. It was all so short-sighted. So *wasteful*. Seven people had decided to toss their lives away on a symbol.

These are people who have a history of resisting centralized authority, Colonel Tanaka had said. He hadn't understood. He did now. They weren't rational. They weren't disciplined. They valued their own lives less than the prospect of his death.

What struck him most—what offended him as much as the still-implausible idea that he'd watched Kasik be murdered—was the monstrous ingratitude of it. The hubris of believing that Duarte's path for humanity's future was worth killing innocent people to resist. And after Trejo had been so generous with them.

He tapped the monitor lying on his desk, and the comm officer in security replied with a crisp, "Yes, sir."

"Please have Colonel Tanaka report to me in my office immediately."

"Sir, yes sir."

Singh killed the connection almost before the officer finished speaking. He looked around his office, not to take in anything new so much as to judge his own mind. He wasn't feeling the shuddering in his hands anymore. His eyes were able to move from the door to his desk to the little ferns in their planters beside the wall without jittering back and forth of their own accord. He'd been in shock. Only a little. And only for a short time. It was normal. Natural. Expected. The physiological effects were only the consequence of being an animal in a stressful situation. There was no reason for him to feel ashamed.

And yet, when Tanaka entered the room with that little half smirk on her lips, he had to rein his anger in. *Is this funny to you?* He didn't say it.

"Sir," she said, bracing. "You wanted to see me?"

"I was almost murdered today," Singh said. "I found your silence on the matter disturbing."

Tanaka's expression shifted. A little chagrin, maybe? It was hard to tell

with her. Her voice didn't have the crispness he'd expect of someone being dressed down. "I apologize. After your safety was established, my focus was on the response and investigation. I should have reported in sooner."

"Yes, well," Singh said. "Are you ready to make your report now?"

Tanaka gathered her thoughts visibly, then nodded to the chair across the desk from his, silently asking his permission to sit. He waved a hand. She sat, leaning forward, her elbows resting on her knees.

"The basic facts appear straightforward. The attempt was instigated and organized by Langstiver. He was the head of security before we came, and his co-conspirators were drawn from the ranks of the local security force."

"Why weren't we monitoring them?" Singh asked.

"We were. But it appears that Langstiver wasn't using the station network. My team is still digging into it, but it looks like he did his coordination and planning on an encrypted network set up in the power conduits. Physically separate from the main system the way the *Storm* is from Medina. Air-gapped. From what we can tell, it was put in by criminal elements in Medina Station. Langstiver also had relationships there."

Singh leaned back a centimeter in his chair. "Criminal elements? You mean he was *corrupt*?"

"It's not unusual on this side of the gate," Tanaka said. "And it makes the investigation more complicated than I'd like. Add to that, he appears to have purged several caches of data he still had access to and inserted false entries into what we have got. And Langstiver and his little friends aren't going to be questioned by anyone but God at this point."

"But you've found the network they were using."

"One of them," Tanaka said. "There may be others. Part of the problem is that Medina wasn't run as a military installation. There were—and probably still will be—competing levels of culture and infrastructure. Controlling the official channels is trivial, but even the officials were using additional undocumented frameworks. It's not like the locals have to create ways to get around our surveillance. All those ways were built in before we showed up."

She lifted her hands in a shrug. Singh had a stark flashbulb memory of Kasik, and with it a powerful, all-pervading dread. In his imagination, Nat and the monster were looking at a picture of him with blood spilling down his chin. It wasn't the prospect of his own death that brought the flush of rage. It was how cavalier Tanaka was being with *them*.

“Well, we’ll have to address that directly, then,” Singh said. “Mandatory curfews and roaming checkpoints will be a start. And restrict the station security forces to quarters until they can be interrogated and evaluated for service. And I’ll want a list of anyone who might pose a threat moving forward for precautionary monitoring. And ... hm. Yes, and coordinate that through the *Gathering Storm*. If we can’t be sure the local system’s clean, we should use our own. The most important thing is that the systems on the *Gathering Storm* not be compromised.”

“I’ve already set up an encryption strong room,” Tanaka said, nodding without seeming to agree. Her sigh was like grit on his skin. “But you want to be careful about a crackdown, sir. Especially this early on. It could send the wrong message.”

“The wrong message,” Singh repeated, stretching out each syllable into a question and a confrontation.

“Belter culture and identity is built around pushing back against authority. This is what that looks like in practice. We knew something like this was possible, and—”

“We did?” Singh said, his voice sharp. “We *knew* that, did we?”

Tanaka’s eyes flattened and her lips thinned. “Yes, sir. We did. It’s why I had a fire team with you at all times. And, respectfully, it’s why you’re alive.”

“Pity there wasn’t one for Kasik.”

“Yes, sir,” Tanaka said. The languor in her tone was gone. She had the tightness in her voice that said that at last she was taking him seriously. “I’m sorry to have lost him. But that doesn’t change my assessment. Bringing Laconian focus and discipline to Medina Station and the other systems isn’t a matter of imposing our customs and rules on them.”

“I’m surprised to hear you say that.”

“Our discipline is *ours*, sir. The same actions can have different meanings in different contexts. What would be routine back home would seem draconian here. Anything harsher than routine will read as a wild overreaction. I believe the high consul would agree that underreacting to this would be a more persuasive show of authority.”

Singh stood up. He hadn’t meant to, but the need to move, to occupy the space inside his office, was suddenly overpowering. Tanaka stayed still. Her expression was like someone tracking a target on a firing range—focused, but emotionless. He walked to his sideboard and poured himself a drink

since his aide wasn't there to do it for him.

"It's an interesting perspective, and I can respect it," Singh said. "But I don't share it. You have my instructions." The alcohol was sharp and strangely acrid in his mouth. His gut rebelled a little at it. He swallowed anyway, trying to enjoy the bloom of warmth in his throat. Kasik had had a better hand at this than he did.

"Governor," Tanaka said, not standing. It was the first time he could remember her using the title. "I strongly urge you to reconsider this. At least sleep on it before we implement it."

He turned to look at her. He imagined himself as she saw him. A young man, off Laconia for the first time as an adult. Having been the target of enemy action for the first time. Seeing an unplanned death by violence for the first time. He must seem shaken and weak to her. Because as much as he hated the fact, he did feel shaken and weak. And naked before her implacable and judging gaze. She thought he was being irrational. Letting his fear make his decisions.

And if he changed his course now, it would prove her right.

"Respectfully," Tanaka said, "as your head of security and a woman with a lot of years of experience in her bag? This isn't a set of orders I can support."

Singh took in a long breath between bared teeth. His gums went cold with it. Whether he was right or wrong didn't matter now. He was committed.

"Your second is Major Overstreet?"

"Yes, sir."

"Please send him in on your way out. You're relieved of your command."

There it was in the flash of her eyes and the lift of her chin. The contempt he'd known would be there. Giving in to her would only have helped cultivate it. Tanaka had never respected him. She thought herself better suited to make the policies of governance than he was. It didn't matter whether she was right or not.

She stood wordlessly, braced, and stalked out of the room. He more than half expected her to slam the door as she left, but she closed it gently. He finished his unpleasant drink in a gulp and went back to his desk.

The alcohol did what it was supposed to do, taking his too-sharp mind back just half a degree. Letting him relax, just a little bit. He wouldn't have

another one.

He pressed his palms flat against the surface of his desk, feeling the little bite of cool fading quickly. He took a deep breath, let it out slowly. Then again. When his calm was more or less reestablished, he opened his personal log and reported his decision and the reasoning behind it. *Visible weakness to my chief of security undermines confidence in the chain of command. Tanaka's expertise is admirable, but her placement on Medina proved unsuitable. Recommend her without prejudice for more appropriate duty.*

Hopefully his superiors would approve of his actions. If not, he'd know soon enough. It was done. Time that he got back to work. He felt better now. More centered. More nearly in control. It had been a bad day. Maybe the worst he'd ever suffered through, but he was alive and his command was intact. And it was just a bad day.

He opened a fresh message, flagged it for immediate delivery. For a moment, he felt the impulse was to send his first message home to Nat. To be with her even if it was only a little bit. This attenuated, one-way presence would be better than nothing. But it would wait until he'd done his duty. Duty always came first. He routed the message for the *Tempest* instead of home.

"Admiral Trejo," he said into the system's camera. "I am including preliminary data provided by former Medina Security Chief Langstiver and confirmed by my own staff—"

His own staff meaning the dead man. Meaning his first sacrifice to the empire.

"Ah. Yes. Confirmed by my own staff concerning an unexpected side effect of our actions while securing Medina Station. If command agrees with my assessment that this windfall provides a significant defense and is willing to position a ship equipped with a USM field projector permanently to the ring space, it is my belief that the timetable for further occupation can be moved up considerably. If the *Tempest* adopts a more aggressive schedule, the local forces in Sol system will have a considerably reduced period to prepare defenses. We can have absolute control of Earth and Mars in weeks."

Chapter Seventeen: Holden

Stay still,” the Laconian said. “Look at the red dot.”

Holden blinked and did as he was told. The sack of rations tapped against his leg like it was trying to get his attention, but he didn’t shift his weight. The dot on the hand terminal seemed to look back at him, and something flashed filling one eye with yellow. The guard’s hand terminal chimed, and he shifted to Naomi. His other hand was on the butt of his gun. “Stay still. Look at the red dot. You can move along, sir.”

“I’m with her.”

“You can move over there, sir,” the guard said, gesturing down the corridor with his chin. His voice didn’t make it a request. Holden walked a few steps, then paused while he was still close enough to go back if something happened. Not that he knew what he’d do.

The hand terminal chimed again and the guard nodded Naomi forward, waiting until she was back with Holden and the two of them were moving down the gently curving hall of the crew decks before he turned back to the line and the next identity to check and record. An older man with a close-cropped beard who was smiling at the guard like a dog hoping it wouldn’t get kicked. “Stay still,” the guard said. “Look at the red dot.” And then Holden and Naomi turned the corner and left the checkpoint behind.

He felt his gut release a little, the tension backed off a notch just by not being in a direct line of fire.

“Well, this sucks,” he said.

The security announcement had changed Medina like dye dropped into water. The rolling curfew meant no one in public spaces off-shift, and three one-hour periods each cycle when no one could be out of their quarters. A congregation ban—no more than three people in a group. Anyone with a weapon would be arrested. Anyone making unauthorized use of the comm system would be arrested. Anyone that the security forces deemed a threat would be arrested. With every new edict, the nature of the station itself

shifted, and the fragile thought that maybe everything would work itself out, that maybe it would be all right, receded.

He knew the station architecture hadn't really changed. The walls were still at the same angles as before, the hallways curved around the drum the same as they ever had. The air smelled the way air smelled anywhere. It was only the faces of the people that made everything seem smaller, closer, more like a prison. The faces and the checkpoints.

They reached their rented quarters, and Naomi tapped in the manual override code, since their hand terminals were still locked out. The door slid open. When it slid closed behind them, Naomi sagged against it like she was on the edge of collapse. Holden sat at the little built-in table and unpacked the bag in silence. Pad thai and red curry, both with tofu and both spiced enough to make his eyes water a little bit just at the smell of them. On another day, it would have felt like a luxury.

Naomi went to the bath, washed her face in the little sink, and came back out with droplets of water still clinging to her hair and eyelashes. She dropped down across from him and scooped up a fork.

"Any thoughts?" she asked.

"About?"

She waved the fork in a small circle, indicating the room, the station, the universe. Then she speared a cube of tofu and popped it in her mouth.

"Not yet," he said. "I've got to say, I wish that those assholes hadn't tried to kill this Singh fella."

"Or that they'd done a better job," Naomi said, and Holden felt a twitch of anxiety in his gut. Was station security monitoring their cabin? Was that kind of offhanded joke going to get them sent to the brig? Naomi saw it in his face.

"Sorry," she said, half for him and half for the microphone that might or might not have been there. "Bad joke."

"I'm thinking this takes the Luna consulting gigs off the table, though."

"Seems like it. And Titan."

"That's a shame. I would have liked Titan."

"If only we'd gotten out a week earlier," Naomi said. "Things were different then."

"Yeah," Holden said. The pad thai was rich and hot, and it tasted almost like they'd used real limes and peanuts to make it. Almost, but not quite. He put his fork down. "I don't know what to do."

“Eat,” Naomi said. “And when you’re done with that, come take a shower with me.”

“Seriously?” he said. She hoisted an eyebrow and smiled.

They ate in silence after that. He thought about putting on some background music, and even reached for his hand terminal before he remembered that it was dead. After, Naomi put the plates and forks into the recycler and led him into the bathroom by the wrist. She pulled off her clothes slowly, and he felt himself responding to her body despite the stress and fear. Or maybe because of it. Lust and anxiety mixed into something that was more than one kind of desperation. She got the water to a decent temperature while he stripped, and then they were there together, arms around each other as the warm cascade filled the curves where their bodies made cups and reservoirs. She leaned her head against his, her lips beside his ear.

“We can talk now,” she murmured. “We’ve got about fifteen minutes before the rationing kicks in.”

“Oh,” he said. “And here I thought this was just my masculine charm.”

She grabbed him gently someplace sensitive. “That too,” she said, and the laughter in her voice was better than anything that had happened in days. “We need to make a real plan. I don’t know what’s going to happen with our money. We only had this room to the end of the week, and I’m not sure whether we’ll keep it past that or if they’ll throw us out early. Or anything else, really. Not at this point.”

“We’ve got to get back to the *Roci*,” he said.

“Maybe,” Naomi said. “Unless that calls more attention to the kids. It might not be a kindness to have James Holden of the *Rocinante* ride again. Unless that’s a fight you want to be part of.”

“You think there’s going to be a fight?”

She shifted against him, their skin slipping distractingly under the flow of water. “What would Avasarala say?” Naomi asked.

Holden moved his arms around the small of her back, pulled her gently against him. Kissed her gently. “That Governor Singh fucked up,” he said softly. “That cracking down on the enemy this hard shows that you’re afraid of them.”

“Yup,” Naomi said. “The people who went after him? They were assholes and amateurs. There’s a real underground going to start now, and it’s going to have the professionals. If you and I keep our noses very, very

clean, we might be able to stay out of that. If we start reaching out to the crew, security may think we're putting the band back together."

"So leave them out of it. Commit fully to our new lives as war refugees?"

"Or suck it up, get the band back together, and die as dissidents."

"I'm really wishing Titan were still on that list of options."

"That's waiting for yesterday, sweetheart."

He rested his head against her shoulder. The water ration warning cleared its throat. Just the first one, though. They still had time.

"Why do I get the feeling I'm more freaked-out about this than you are?" he asked, and felt her smile against his cheek.

"You're new here," she said. "I'm a Belter. Security coming down on you just because they can? Checkpoints and identity tracking? Knowing that you could wind up in the recycler for any reason or no reason? I grew up like this. Amos did too, in his way. I never wanted to come back here, but I know how this all goes. Childhood memories, sa sa que?"

"Well, shit."

She ran her hand down his spine and pushed him back. The wall was cold against him. Her kiss was rough and strong, and he found himself pushing into it in a way he hadn't in years. When they came up for air, Naomi's eyes were hard. Almost angry.

"If we do this," she said, "it's going to be ugly. We're outgunned and outplanned, and I don't see how we win."

"I don't either," he said. "And I don't see how we stay out of it."

"Getting the band back together?"

"Yeah. And we were so close to out."

"We were," she said.

The water ration chimed again, a little more urgently. Holden felt some vast emotion move in his chest, but he didn't know what it was. Grief or anger or something else. He turned off the water. The rush of white noise stopped. The gentle chill of evaporation brought goose bumps up his arms and legs. Naomi's eyes were soft, dark, unflinching.

"Come to bed," he said.

"Yes," she answered.

In the darkness, the control pad on the door glowed amber. Green would have meant unlocked. Red, locked. Amber meant override. It meant that they weren't in control of it. That, in a fundamental way, it wasn't their door anymore. It belonged to station security. Naomi was still asleep, her breath deep and regular, so Holden sat in the darkness, not moving to keep from waking her, and watched the amber light.

It was the dead hour of curfew between each shift. Right now, all the hallways in Medina were empty. The curved fields and parks of the drum. The lifts in lockdown. Only the Laconian security forces could travel freely while everyone else huddled in place. Including him. Measured in work-hours, it was a massive tax. If it had just been the *Roci*, it was the same as losing someone for eighteen hours a day. Medina put a coefficient on that with at least three zeros at the end. Someone in the Laconian chain of command thought it was worth the sacrifice. That alone told him something.

Naomi murmured, shifted her pillow, and fell back into it without ever quite breaching up to consciousness. She would be awake soon, though. They'd been sleeping in the same couch long enough that he knew the signs her body gave out without even being certain what he was reacting to. He felt it when she was heading back up. He hoped she could stay down until it was their door again. Maybe she wouldn't feel the same kind of trapped that he did.

Over the years, the *Roci* had done its fair share of prisoner transport duty. Houston had been the most recent, but they'd taken on half a dozen like him one time and another since the *Tachi* had become the *Rocinante*. Now that he thought about it, the first had been Clarissa Mao. All of his prisoners had spent months in a cabin smaller than this, staring at a door they couldn't control. He'd always known in a distant, intellectual way that had probably been uncomfortable for them, but it wouldn't have been that different from being in a brig, and he'd been in brigs.

It wasn't the same, though. A brig had rules. It had expectations. You were in a brig until your lawyer or union rep came to talk to you. There would be hearings. If it went badly, there was prison. One thing followed another, and everyone called it justice, even when they all knew it was an approximation at best. But this was a cabin. A living space. Turning it into a prison cell felt like a rupture in a way that an actual prison cell wouldn't. A brig had an inside and an outside. You were in it, and then you passed

through a door or a security lock, and you were out of it. All of Medina was a prison now, and would be for another twelve minutes. It left him feeling claustrophobic and oppressed in a way he was still trying to wrap his head around. He felt like the station had just become small as a coffin.

Naomi shifted again, pulling the pillow over her head. She sighed. Her eyes stayed closed, but she was with him again. Awake, but not ready to admit it.

“Hey,” he said, softly enough that she could pretend not to have heard him.

“Hey,” she said.

Another minute passed, and Naomi pulled the pillow back under her head, yawned, and stretched like a cat. Her hand landed on his, and he laced his fingers between hers.

“Been brooding the whole time?” she asked.

“Some of it, yeah.”

“Did it help?”

“Nope.”

“Right. Spring into action, then?”

He nodded at the amber door alarm. “Not yet.”

She glanced down. The override light flickered in her eyes like a candle flame. “Huh. All right. Brush teeth, pee, and spring into action?”

“That’ll work,” he agreed, and hauled himself up out of the bed. The way it worked out, he was brushing his teeth when the door clicked over to red—locked, but under his control. The relief and resentment at the relief came packaged together.

The hallways in the residential deck were no busier than usual. The checkpoint they’d passed through earlier was gone, relocated to some other intersection of hallways. Keeping the surveillance unpredictable and visible, he assumed. If the security systems were in Laconian control, the guards and checkpoints were all theater anyway. A show of force to keep the locals scared and in line. The transport was down—no lifts, no carts. If anyone wanted to go anywhere, the only option was to walk.

In the drum, the false sunlight was as warm as ever. The fields and parkland, streets and structures, curved up and around the same way they always had. Holden could almost forget that it was an occupied station until they interacted with anyone.

The man they paused to get bowls of noodles and sauce from gave them

extra packets of peanuts and a twist of cinnamon sugar candy, on the house. An older woman they walked past as they headed aft toward engineering and the docks smiled at them, then stopped and stroked Naomi's shoulder until little tears appeared in the older woman's eyes. A group of young men heading the other way made room for them to pass long before they needed to and nodded their respect. It wasn't, Holden decided, that people recognized him and deferred to his celebrity. All the citizens of Medina were treating each other like everyone was made from spun sugar. Likely to shatter if you breathed on them too hard. He recognized it from being on Luna after the rocks had fallen on Earth. The deep human instinct to come together in crisis. To take care of each other. In its best light, it was what made humanity human. But he also had the dark suspicion that it was a kind of bargaining. *Look, universe, see how kind and gentle and nice I am? Don't let the hammer fall on me.*

Even if it was only grief and fear, he'd take it. Anything that helped them all treat each other well.

Beside a little café that served tea and rice-flour cakes, a dozen people in Laconian uniforms were building something—a wall made from cubes two and a half meters to a side, eight wide, and three high, with steel walls and backs and wide mesh doors facing the pathway. Like kennels. Half a dozen locals stood watching, and Naomi went to stand beside them. A young woman with mud-brown hair and a scattering of freckles across her cheeks made a little space for them. Another small kindness, like a coin in a wishing well.

"Are they expecting prisoners, then?" Naomi asked the woman as if they were friends. As if everyone who wasn't Laconian was part of the same group now.

"That's the thought," Freckles said, then nodded a greeting to Holden. "Making a show of it. Supposed to keep us all in line, isn't it?"

"That's how it works," Holden said, trying to keep the bitterness out of his voice. "Show everyone what the punishment is. Enough fear, and we'll all be obedient. They'll train us like dogs."

"That's not how you train dogs," Freckles said. She made a little, deferential bow when he looked at her, but she didn't back down. "You train dogs by rewarding them. Punishment doesn't actually work." Tears glistened in her eyes, and Holden felt a lump in his own throat. *They'd been invaded. They'd been taken over. They could kill everyone on the station,*

and no one would be able to stop it. This couldn't be happening, and it was happening.

"I didn't know that," he said. Banal words, the closest he could offer to comfort.

"Punishment never works," Naomi said, her voice hard. Her face was unreadable. She shifted her weight like she was looking at sculpture in a museum. The spectacle of power considered as art. "Not ever."

"Are you from here?" Freckles asked. She hadn't recognized them.

"No," Holden said. "Our ship's in the dock. Or our old ship anyway. The one we came in on. And the crew we flew with."

"Mine's in lockdown too," Freckles said. "The *Old Buncome* out of New Roma. We were slated to go home next week. I don't know where we're going to stay now."

"Not on your ship?"

She shook her head. "The docks are off-limits. No one's allowed on their ships without escort. I'm hoping we can find rooms, but I've heard we may have to camp out here in the drum."

Naomi turned, and he saw everything that he was thinking mirrored in her face. If the docks were off-limits and the crews turned out, the others wouldn't be on the *Roci*. And with the network down, they couldn't put through a connection request. They didn't have any way of contacting Bobbie or Alex or Amos. Or Clarissa. Counting each deck and the inner surface of the drum, it was something over fifty square kilometers of hallways, cabins, access tubes, and warehouses. Recycling plants. Hydroponic farms. Air storage. Medical bays. A maze the size of a small city, and somewhere in it, four people he needed to find.

Holden coughed out a small, harsh laugh. Naomi tilted her head.

"Nothing," he said. "It's just not very long ago I was thinking how *small* Medina felt."

Chapter Eighteen: Bobbie

A rope defined the line to the ships. Two and a half, maybe three hundred people, each with their fist on it, went the length of the dock and switched back twice. Men and women in the jumpsuits of dozens of different companies jostled in place in the dock's microgravity, inching forward along the line as if registering their silent impatience would make the whole operation move faster. Laconian guards floated along the perimeter, rifles drawn and ready for violence. If it came to that, Bobbie thought, it wouldn't be surgical. Not in a mob like this. If anyone started anything, the air recyclers would be spitting out blood clots for months. She hoped everyone else knew that too. She hoped they cared.

Every now and then, a team of Laconian military escorts came, took the people from the moored end of the line, checked their authorization, screened them for weapons, and led them off to their ship. Everyone on the rope would pull a little forward, grabbing on another half meter closer to their turn, feeling the weave of the strands, the grease from all the palms before their own. The unmoored end floated free, waiting for the next hapless crew to join the waiting horde.

They were lucky, Bobbie told herself. Most of the ships had full crews of twenty or thirty people. The *Roci* just had the four of them. They could all go aboard at once. Small blessings indeed. Almost too small to see.

The guards led away another group. They moved down the rope again, that much closer.

"How you holding together, Claire?" Bobbie asked.

Clarissa took a long, shuddering breath and nodded. When she spoke, the words came just a little too fast, and all the consonants had sharp edges. Like she was trying to rein them in and couldn't. "It would be very nice to get to the med bay. But right now, it's just euphoria and nausea. Nothing I can't handle."

"That changes," Amos said, "you let me know."

“Will,” she said. Bobbie wasn’t sure she liked the sound of that. There weren’t many actions Amos could take that would make the situation better. If putting their heads down and enduring wasn’t enough to get Clarissa to her medications, the options got bad fast.

“Anyone else think it’s cold in here?” Alex said.

“It is,” Clarissa said. “I think the pressure’s a little low too. The environmental systems are all off.”

“That doesn’t sound like a good thing,” Alex said.

“Belters,” Bobbie said. “We trained for this.”

“You trained for low air pressure?” Amos asked. He sounded amused. That was better than sounding frustrated.

“We trained for occupying Belter stations. One of the base tactics that Belters used was throwing environmental stasis off just enough that we’d have to keep bumping it up our priority queue. Someone somewhere on the station is trying to make it harder for these folks.”

“Huh,” Amos said. “That’s pretty ballsy.”

“It only works if the occupying force isn’t willing to just kill everyone and start over. So yeah. There’s an element of playing chicken.”

The group in front of them on the rope wore gray-black jumpsuits with CHARLES BOYLE GAS TRANSPORT logos in green on the back. The one floating nearest them looked back over his shoulder, catching Bobbie’s eye almost shyly. She nodded, and the man nodded back, hesitated, tilted his head a centimeter forward.

“Perdó,” he said, nodding toward Clarissa. “La hija la? She’s sick?”

Bobbie felt herself tense. It wasn’t a threat. It wasn’t an insult. It was just someone who wasn’t part of her crew putting themselves into her business. But maybe she was feeling as tense as Amos. She took a little breath and nodded.

The man tapped his compatriot ahead of him on the rope. They spoke for a moment in Belter cant so thick and fast, Bobbie couldn’t follow it, then they all released the rope and gestured Bobbie forward. Giving up their place in line so that Clarissa could get to the *Roci* a few minutes sooner. It was a tiny thing. A gesture. It shouldn’t have hit her as hard as it did.

“Thank you,” Bobbie said, and ushered the others forward. “Thank you very much.”

“Is is,” the man said, waving her thanks away. It wasn’t an idiom she’d heard before, but his expression explained it. *We do what we can for each*

other.

The Laconians were efficient. The line moved quickly. Even with as many people as were waiting, the *Roci* crew reached the head of the line in only a couple of hours. An escort of four Marines checked her authorizations, scanned them all for weapons. Apart from a momentary hit of panic when they were looking at Clarissa's scan—would her modifications keep them from letting her on?—everything went smoothly. And after all, her mods had been designed to get past security unnoticed. Good to know they were still doing their jobs, even while they killed her.

The *Rocinante* was waiting for them in the dock, loyal as a dog. When they cycled the airlock and pulled themselves in, Bobbie felt her shoulders relax. The air smelled familiar. It wasn't even a particular scent so much as a sense of rightness. Of being home. Bobbie let herself imagine they were getting on board to leave, that they'd be burning for one of the gates. Diving down toward one sun or another.

Someday, maybe. Not now.

"You have one hour," the escort lead said.

Bobbie shook her head. "My mechanic needs to be in the med bay for longer than that. She has to have a blood flush."

"She'll have to do the best she can in an hour. She can visit medical facilities on the station."

Bobbie looked at the guard. The man had a wide face and skin just a shade darker than Bobbie's own. A lifetime of habit mapped out how Bobbie would try disarming him, controlling his weapon, getting into cover. Chances weren't great. The Laconians moved like they'd been well trained, and the oldest of them still looked to be hauling around a decade less than she was.

"It's fine, Captain," Clarissa said. "I can set the system to do a fast push and get blockers. I've done it before."

"If you need another waiver," the guard said, "you can apply for it once you've left."

"Fine," Bobbie said. "Let's get on with this."

They moved through the ship like they were visiting someone in prison. The guards went with them everywhere, examined everything they took from their cabins, watched every command they gave the ship, copied every report the ship returned. The resentment in Bobbie's gut ached, but there wasn't anything to be done about it. Their pass allowed them to retrieve

personal items and any tools they needed for their work, provided they didn't present a security risk. Which was a shame. There was a part of her that would have liked to explain that she worked as a mercenary so that she could walk out of here with Betsy around her like a shell.

As she packed her things from the captain's cabin, her guard watching wordlessly from the doorway, she opened a connection to Alex.

"What's the good word?" she said.

"Roci's a little bored, but she's in good condition," Alex said from the flight deck. "A little impurity in the water supply we should look at, but it's likely just a seal that's wearing out. A little stray leaching."

"Okay," Bobbie said. She wanted to stay. She wanted to spend her hours polishing her ship and fixing every flaw they could put hands to. She had thirty-five minutes left. "Flag it. We'll dig in next time."

"Next time, Cap'n," Alex agreed. Because there would be a next time. Even if there wasn't, they were going to pretend there would be. She locked down her cabinets, checked the message queue from the ship's system to make sure everything was getting to her hand terminal—or at least that the Laconian censors were locking everything down equally—and pulled herself back down the corridor and toward the lift.

"This a Martian ship?" her guard asked.

"It is," Bobbie said as they reached the lift and headed down for the machine shop.

"I've seen some like her back home. First fleet had a lot like this."

First fleet meaning all the ships that Duarte had stolen when he'd escaped to Laconia. But also, Bobbie realized, meaning there was a second fleet. One with ships like the monstrosity that had killed the *Tori Byron*.

"Must look pretty quaint, eh?" she said, trying to make light of it, inviting the guard to give something away. But if there had been an opportunity there, she'd missed it.

In the machine shop, Amos had almost finished collecting a set of safety-approved tools into a small ceramic toolbox. He nodded to her as she floated in, stopping herself on a handhold. She saw his sign again: YOU TAKE CARE OF HER. SHE TAKES CARE OF YOU. The words had more weight now. She'd barely had a chance to take care of the *Rocinante*, at least not as her captain. She hoped another chance would come.

"You ready to roll out?" she asked.

"Yep," Amos said.

Clarissa and Alex were already in the airlock with their guard when Bobbie and Amos got there. Clarissa looked more relaxed, and there was more color in her skin. Alex would have seemed relaxed to anyone who didn't know him, but Bobbie saw how he looked at the ship, how his hand lingered on the bulkhead. He knew as well as she did that there was no guarantee they'd ever be back.

The guards escorted them along the nearly empty docks, back toward the transfer point to the drum and spin gravity, then went back for the next crew to the next ship. When they were alone, Bobbie cleared her throat.

"All right. How did that go?" she asked.

"They've locked her down pretty tight," Alex said. "But they didn't get everything. Give me twenty minutes, I can probably get her working."

"I've got a decent kit," Amos said, holding up the toolbox. "Could get some low-level work with just this. Not cutting through any decking, though."

"Claire?"

Clarissa smiled and shrugged. "I feel a little better, and I've got enough blockers."

Bobbie put a hand on her thin shoulder. "We'll take care of you," she said.

"I know you will," Clarissa said.

"All right, then," Bobbie said. "The way I see it, the next step is find someone who can get messages back to the union. Or Earth-Mars. See if there's anyone out there with a plan, or if we're going to have to make one up on our own."

"We can do that," Amos said. "Shouldn't be hard."

"You sure?" Alex said. "This is Medina Station under occupation by a bunch of splinter Martian military expats. It's not Baltimore."

Amos' smile was as placid as always. "Everywhere's Baltimore."

Bobbie had known and worked with Amos Burton for years, and he kept being able to surprise her. For the next two days, Amos took the lead, moving through Medina Station apparently without any particular aim or purpose. They went to sit in a bar by the water recycling plant, went to

interview with a pop-up service that was matching people who'd been locked off their ships with accommodations, played a little dirt football with a crew of technicians whose old split-circle OPA tattoos had been softened and smudged by the years.

Every now and then, Bobbie caught something—a phrase or a gesture—that didn't quite feel right, like there was a second conversation going on at some frequency her ears couldn't pick up. She took up her position at Amos' back and watched for threats, either from the Laconians or the locals.

Everywhere they went, the station seemed to be on the edge of something. It was in the air and the voices of everyone they spoke to. Guards in power armor. Checkpoints. The Laconians had erected an open-air jail, and filled it with men and women living behind bars like animals at a particularly shitty zoo. With hand terminals locked down and the internal communications network restricted to the point of uselessness, every conversation seemed fraught and dangerous. *Anything worth encrypting is worth not putting on a network in the first place*, Amos would sometimes say. Bobbie had never really thought about how much communication changed when every time you spoke, you had to be close enough that the other person could stab you if they wanted to. Never before, anyway.

And then, after three days, the old Belter who'd been the opposing goalie at their football game came to them at the little public table where they were eating mushrooms and noodles, nodded to Amos, and walked away. The big man got up, stretched his neck until it popped, and turned to Bobbie.

"We've got a thing," he said.

"A good one or a bad one?" she said.

"One or the other."

Bobbie took a last mouthful of her breakfast, chewed, and swallowed. "Understood," she said. "Let's go."

Clarissa and Alex stood when she did. Part of her wanted to order them to stay back. If things went south, they'd be safe. As if anywhere was safe. She didn't say anything.

The old Belter led them to an access corridor with a ramp that sank down, out toward the skin of the drum and the emptiness beyond it, the void always just underfoot. They passed two different concealed guard posts that she saw, and while she didn't think there were any others that had escaped

her notice, she couldn't be sure. The old Belter didn't say anything, and Amos didn't try to strike up a conversation.

The warehouse they ended up in was half filled with storage boxes fixed to the deck with maglocks. The lighting was harsh, restricted-wavelength worklights with a flicker that made her feel like her vision was strobing if she moved her hand too quickly. Three men leaned on the crates, their arms loose at their sides so they wouldn't have to spend the quarter second uncrossing them if things came to violence. Bobbie felt a warmth in her gut, a presentiment of trouble that was almost welcome. Invading ships with unimaginable weapons, protomolecule technology that could rip atoms apart, sudden empires imposed without warning or precedent. She'd grit her teeth and move forward because there wasn't another option. But thugs in warehouses was territory she understood.

The man in the middle of the three was a Belter, tall and muscular. His skin was the same brown as his hair and eyes. Even if he hadn't been pretty, he'd have been striking. And he was pretty.

"Heard you wanted to talk," he said.

Amos looked back at her, and pointed to the pretty man with his chin. He'd gotten them this far, but she was the boss. This was hers now.

"Who'd you hear we wanted to talk to?" Bobbie asked, stepping forward. Clarissa shifted out to her side. As weak and compromised as she looked, they'd underestimate her. Bobbie didn't know what using the implants would do to Clarissa, but by the time it took its toll, all three of the men would be incapacitated or dead. And that was without her and Amos weighing in.

The pretty man tilted his head.

"Names are dangerous, coyo," he said.

Bobbie pointed a thumb to herself. "Captain Bobbie Draper." She turned to the others. "Alex Kamal. Clarissa Mao. Amos Burton. Now, who the fuck are you?"

The pretty man scowled, tilting his head like he was trying to recall a song that was just at the edge of memory. It was a look she'd seen before, and she didn't feel like helping him place her. Not yet, anyway.

"Saba," the man said at last, "and that's enough for you right now."

"You're playing this all pretty close to the chest, Saba," Bobbie said.

"Not interested in being under the authority of the authorities," he said. "I've got reasons for that."

“Well, I’m not working for Laconia, so we can stop the bullshit, right?”

“Not sure we can,” Saba said. His hand terminal chimed—a sound Bobbie didn’t remember hearing since the crackdown—but he ignored it. Interesting that he had a working hand terminal, though. The chances that he was the real deal went up in her estimation.

“Heard you were looking to get in touch with the underground,” Saba said. “Leaves a man wondering why. You looking to trade with the new boss?”

“Nope,” Bobbie said.

“Then you thinking you’re going to come tell us what to do?”

Bobbie smiled. She could feel her teeth against her lips. Either they were going to back each other down, or this was going to end in blood. She hoped it was the former, but it wasn’t her call. “We were there when that fucking idiot tried to kill the governor. If that’s the level you people are working at, then yes, I’d be happy to help organize. Someone ought to.”

Saba’s face was cool. “Belters been standing under the oppressors’ boot for generations. You think you’ve got something to teach *us*?”

“Apparently so,” Bobbie said. “Seems like some of you assholes have gotten pretty rusty.”

A little darkness came to Saba’s olive cheeks. He stood up, stepped forward. Bobbie took her own step in to meet him. If she showed weakness now, they’d never take her seriously again. The chirp of his hand terminal seemed to come from another universe.

“What?” Bobbie said, not giving him the tempo. “You planning to do this without any allies? Without any support? You against the Laconian Empire? I’ve seen how that went up to now, and—”

“Saba!”

The new voice came from behind her. She didn’t want to turn her back on the three Belters, but she didn’t want someone unknown at her back either.

“Saba!” the voice said again. It sounded young. Excited. Bobbie threw a glance over her shoulder. A young woman in a green jumpsuit, grinning like someone had just given her a present.

“Que, Nanda?” Saba asked.

“Found someone,” the girl said. “Look.”

And from behind the girl, Holden and Naomi came into the room, squinting at the ugly light.

“Hey!” Holden said, and then “Bobbie. This is great. I wasn’t sure how we were going to find you.”

Saba whistled low. “James fucking Holden. You’ll no believe how much I’ve heard about you.”

“All good, I hope?” Holden said, walking forward, oblivious to the tension in the room. Or maybe choosing to ignore it. It was always hard to tell with him. “You’ve met my old crew already?”

“You crew?” Saba said, then looked at Bobbie as if seeing her for the first time. He laughed. “Savvy I did. Well, then. Welcome to the underground.”

She smiled, but something ugly plucked at her guts. *James fucking Holden*, Bobbie thought. Three magic words, and just like that, someone else was in charge.

Chapter Nineteen: Drummer

The image was grainy, the sound almost as much noise as signal. Half a dozen encryption layers poured on and then stripped back out left their artifacts in the flattened audio and near-false colors. Drummer's heart softened all the same, because there in the middle of it—unmistakably—was Saba. His eyes had the little puff at the lower lid that he got when he was tired, but his smile was luminous.

"No savvy you how good it was to get your message, Cami," he said. "Heart outside my body, you are. And no one better than us two to be where we're sitting."

"I love you too," she told the screen, but only because no one else was in her office.

Avasarala's covert contacts had come through faster than Drummer had hoped. That they'd come through at all was something of a shock. She had been willing to believe the old woman was overstating her powers, claiming a level of influence that retirement and age had long since taken from her. But here was evidence that, whatever else she was, Chrisjen Avasarala wasn't completely full of shit. Saba had burrowed deep into Medina Station like a tick, making connections with as many union operatives as he safely could. And by union, more often than not, he meant OPA.

She listened and took notes by hand as he went through his full report. Writing it out helped her to remember. Sixty-eight people on Medina Station broken into independent cells that went from three to eight. The amateur, botched assassination and the crackdown that followed. Saba didn't have to say that he was using it to recruit more for his effort. That was obvious. The focus moving forward was intelligence gathering and infrastructure. Avasarala's network was all well and good, but having multiple backups, blind zones in the station where the Laconian security couldn't reach, and opening backdoors into the communications of the enemy were how to prepare for the next wave. And find out what the next

wave was going to be.

Drummer found herself nodding with his words, thinking through their implications. The Laconians were routing their comms through a destroyer-sized ship docked on Medina with heavy encryption and an off-ship decrypt local to the station to physically isolate the two. No good way to gather intelligence there, and no chance of breaking into the enemy's system. She'd need to find the firmware code for the antennas and repeaters. Maybe Avasarala's henchmen in the Earth-Mars Coalition had some exploits they'd been sitting on that she could pass on to Saba. The Laconian checkpoints were tying up a third of their ground force. That kept the soldiers busy in the known and public corridors, and gave Saba's people more time to create bolt holes and blind zones. If the crackdown slacked off, they'd want to do something provocative to keep the enemy busy with identity checks and traffic control. Trivial security theater, while the underground dug more tunnels into the body of the station. It was possible that all the updated plans for Medina were in Laconian hands. Any known holes, they had to assume were known to all the players, but making new ones wouldn't be hard for Saba. He understood smuggling as well as she ever had, and maybe better.

The message ended with Saba's impish grin.

"You watch you, m'dil," he said, and blew a kiss to the camera. "Live like you're dead."

Drummer touched the screen as if it were his cheek, but it was cold and hard. *Live like you're dead*. There was a phrase she hadn't heard in a long time. Once, it had been the motto of the Voltaire Collective. A call to courage with a fatalistic bravado that angry adolescents found romantic. She'd found it romantic once too.

She checked the time. Saba's message had run almost twenty minutes. Part of her found it hard to believe it had been that long. She could have drunk in the sound of his voice for another hour and still been thirsty. From her screen after screen after screen of written notes, it was astounding that he'd fit so much information into so short a time.

She went through all she'd written again, committing it to memory, then wiped her notes. Information couldn't be compromised if it didn't exist. She put in a comm request for Vaughn. He answered immediately.

"Where do we stand with the military attaché?" she asked.

"Waiting on word from you, ma'am," Vaughn said.

“Have them in the conference room in ten minutes.”

“Yes, ma’am,” Vaughn said. There was a surreptitious pleasure in his voice. The diplomats and coordinators from the Earth-Mars Coalition had been flooding into People’s Home since the fall of Medina, and Vaughn enjoyed telling them what to do. It was probably a vice, but she didn’t mind indulging it.

Drummer rose from her desk and stretched. Her spine popped once between her shoulders, loudly. She yawned, but not from fatigue. It was the kind of yawn that a runner made before a race. The deep inhalation of someone anticipating great effort. If she’d been keeping a normal schedule, her watch would almost be over. That wasn’t how she lived anymore. Now she was awake when she needed to be awake, and asleep when she could. *Sin ritma* they’d called that lifestyle back when she’d been younger. It was harder on her body now, and it took an extra bulb of coffee to sharpen her mind sometimes, but it also left her smiling in a way she didn’t wholly understand.

Benedito Lafflin, the EMC liaison, was waiting for her twenty minutes later. His fist was closed around a bulb of soda water that was already half collapsed. His wide, toadlike face looked less smug than usual. “Madam President,” he said, standing.

Drummer waved him back down. As she sat, Vaughn brought her a bulb of tea. She took a sip. Hot, but not scalding. Vaughn drifted back to the wall like he was part of the ship’s machinery.

“What are we looking at?” Drummer said.

Lafflin cleared his throat. “Candidly? I think you’re going to be quite happy with the plan.”

“Are you giving me direct control over your fleets?”

He blinked. “Ah ... Well, that’s ...”

Drummer smiled. “I’ll probably still be okay with it. What do you have?”

He took out a hand terminal and threw the data onto the conference room wall. The solar system unfolded before them. Nothing quite to scale, of course. Space was too huge and too empty for that. The fleets of Earth and Mars and the Transport Union were all outlined—location and vector for everything in transit, planetary body and orbital period for everything else. All of it tracked through time. Nothing was ever at rest.

And on the edge of the system, hell and gone from anything, the gate

where the enemy would arrive.

“Given what we know about the enemy battleship,” Lafflin began, “we have worked up several scenarios that we think will give our combined forces the best tactical advantage. The first, of course, being to interrupt it in transit.”

“Walk me through it,” Drummer said.

For the next two hours, Drummer reviewed scenario after scenario after scenario. Lafflin made his case for each of them. Another person like him was with every member of the union board making all the same arguments. Soon the debates would start. With the void cities, the union had a fleet at least as powerful as the EMC. If Saba could make contact with ships in the colonies, it might be possible to coordinate attacks on the slow zone, no matter what Avasarala thought. If not, there was local action to be done on Medina that might be just as good or better.

Time after time, his plans came back to the same thing—protecting Earth, protecting Mars. Keeping the inners from being disrupted, no matter what the cost. Her guess was that the board would see the same things she did. And then ...

She hadn’t wanted to be a police force for the thirteen hundred worlds. She certainly hadn’t wanted to lead a military. But with every new twist, every tactical suggestion, she heard the imagined voices of the board, of Secretary-General Li, of Avasarala. It wouldn’t work. Someone was going to have to take charge, and she didn’t see many scenarios where that wasn’t her.

“Thank you,” she said when the last of the imagined battles had played out on her monitor. “I appreciate your time. Let me confer, and we’ll talk again in the morning?”

“Thank you, Madam President,” he said as Vaughn escorted him out of the room.

As soon as he was gone, she pulled up the scenarios, paging through them all again without him. They’d considered mining their side of the gate with a wall of high-yield nukes, but abandoned it because no one was really sure if the ring could be damaged or not. A safer plan was a series of ships looping up above the ecliptic, doing a high burn and dumping gravel that could make a stone veil over the mouth of the gate. She would be able to control when there were gaps that allowed passage and when any ship making the transit would step into a shotgun blast. And it would last until

they ran out of reaction mass and gravel. It was a Belter tactic. Another gift from the old days. She thought about putting the idea in her response to the EMC, but the truth was she didn't need their permission, and the void city Independence was close enough to the gate that if they went on the burn now, they could have something in place before the board even finished debating ...

Drummer let her head sink into her hands. Her neck ached and a deep, vague craving bothered her—something like thirst, but without a clear sense of what could slake it. If anything could.

She heard the door open behind her, but she didn't bother looking up. Whoever it was, she didn't care. And anyway, it would only be Vaughn.

"Madam President," Vaughn said.

"Yeah."

"Something's come through you should probably see."

"Something wonderful that's going to fill my life with joy?"

"No."

She sat up, waving one hand in a circle. *Get on with it.*

"There's been a new transmission from Medina," Vaughn said. "On the official feeds."

"More threats and posturing from Laconia? Or have they made the war official?"

"Neither one," Vaughn said, and took the monitor focus. A simple video feed of a podium in front of a few tiers of chairs. Drummer was a little surprised by the simple blue curtains at the back. She'd expected more imperial pomp. A Signa Romanum with a double-headed eagle. The chairs were filled with people meant to look like journalists, whether they were or not.

Carrie Fisk walked into the frame and took her place at the podium. Drummer felt her mouth go hard.

"Thank you all for coming today," Fisk said, nodding to her audience. She gathered herself. Looked out, then down again. "Since its creation, the Association of Worlds has been a staunch advocate of independence and planetary sovereignty. As such, we have tracked issues of self-rule in the newly colonized systems and fought for the rights of people living on them. The hegemonic power of Sol system and the Transport Union have proven time and again that those in power have valued the systems unequally. Sol and the union have claimed a de facto sovereignty over what they have,

through their actions, made clear they consider second-class planets and governments.”

“Oh, fuck you,” Drummer murmured. “Fuck you and your quisling bullshit.”

“I have had the opportunity to meet several times with the representatives of the Laconian system about the future of the ring gates and the nature of commerce and governance between the worlds. And I am very happy to be able to say that the Association of Worlds has voted unanimously to accept Laconia’s offers of protection and the coordination of trade. In exchange, High Consul Duarte has accepted the association’s requirements for self-rule and political autonomy. With this—”

Drummer killed the feed. Duarte had planned this too. Not only the military campaign but the story that made it something other than a blatant conquest. *He came back because he thinks he can win, and if he thinks that, you should prepare yourself for the idea that it’s true.* Carrie Fisk would be on the newsfeeds of thirteen hundred worlds—worlds that Drummer was cut off from—and the story she told would find rich enough soil to take root.

“Self-rule and political autonomy?” she said. “At the end of a gun? How does that work?”

“Tribute,” Vaughn said. “A pledge of financial and resource support if called on, but with very little suggestion that there will be occasion for it.”

“Plus the promise that he won’t kill the shit out of them, I’m guessing?”

Vaughn’s smile was flinty. “Fisk didn’t make that explicit, but I think the implication’s there, yes.”

Drummer pressed her hand to her chin, stood up. Part of her wanted to send Vaughn to the med bay to come back with something to keep her awake. Amphetamines, cocaine, anything stronger than another bulb of tea.

“It’s been a long day,” she said. “When the EMC’s messages start coming through, tell them to calm their shit down, and that we’re going to address this.”

“And for the board members?” Vaughn asked.

“Tell ’em the same,” Drummer said as she walked out. “Tell ’em it’s all under control.”

Back in her quarters, she stripped, leaving her clothes in a pathway from the door to the shower. She stood under the near-scalding water, letting it run down her back and over her face. It felt wonderful. Heat conduction as

raw, physical comfort. Eventually, she killed the water, took a towel to sluice off most of the moisture, and then dropped to her crash couch, one arm flung over her eyes. Exhaustion pulled her down into the gel more powerfully than the spin of the drum. She waited for the despair to come.

It didn't. The union was facing an existential threat. The fragile fabric of human civilization in the colonies was ripping before her eyes, and she was relieved. From her first memories to the death of the Free Navy, she'd been a Belter and a member of one faction or another of the OPA. Her brain and soul and identity had all matured with the inners' boot at her throat. At the throat of everyone she loved.

The respectability of Tycho Station and then of the union and now of the presidency had been her dream from the start. The prospect of a Belter reaching power equal to the inners had guided her on, if not for her, then at least a Belter like her. And like all dreams, the closer she'd come to it, the better she understood what it really was. For years, she'd worn power and authority like it was someone else's jumpsuit. Now, with Duarte and Laconia, everything she'd built was falling away. And part of her was happy about it. She'd been raised to fight against great powers. To wage wars she couldn't win, but also couldn't lose. Returning to that now was a staggering loss, but it also felt like coming home.

Her mind began to slip away, her consciousness falling into dream. History was a cycle. Everything that had happened before, all the way back through the generations, would happen again. Sometimes the wheel turned quickly, sometimes it was slow. She could see it like a feed gear, all teeth and bearings with her on the rim along with everybody else. Her last thought before forgetfulness took her and she fell deeply into slumber was that even with the gates, nothing really ever changed so much as repeated itself, over and over, with all new people, forever.

Which, in light of the next morning's first meeting, was more than a little ironic.

"We've never seen anything like this before." She'd known Cameron Tur professionally since she'd first taken a job with the union, and he'd never registered as more than vaguely interested in anything.

Now he sat across the table from her, gesturing with a tortilla like he was conducting an orchestra with it. His eyes were wide and bright, his voice higher and faster than usual, and she couldn't make out what the hell he was saying.

"Hot places in space," she repeated, looking at the schematic. "So, like stealth ships? Are you saying there are stealth ships waiting outside the ring gate?"

"No, no, no," Tur said. "Not that kind of hot. Not *temperature* hot."

Drummer gave a short, frustrated laugh and put the hand terminal down. "Okay, maybe we should try this again like you were talking to a civilian. There are these areas we've seen that are ... what exactly?"

"Well," Tur said, nodding more to himself than to her. "Of course you know that a vacuum isn't really empty. There are always electromagnetic waves and particles that pop in and out of existence. Quantum fluctuation."

"My background is in security and politics," she said.

"Oh. Right," Tur said. He seemed to notice his tortilla, took a bite from it. "Well, vacuum state isn't at all just emptiness. There are always spontaneous quantum creations and annihilations. Hawking-Zel'dovich radiation that allows for—"

"Security, Tur. Politics and security."

"Sorry. Really small things just show up and then they just go away," Tur said. "Much smaller than atoms. It happens all the time. It's perfectly normal."

"All right," Drummer said, and took a sip of her morning coffee. Either it was a little more bitter than usual or she was overly sensitive today.

"So when we turned all the sensor arrays on the gate? To try to get more information about the war and all that? There was interference we couldn't make sense of. It was like the kind we see when signals pass through the gates, but it wasn't localized there. It was out in normal space." He pulled the schematic back up. "Here and here and here. That we know of. There may be others, but we haven't done a full sweep looking for them. But we never saw anything like this, and the logs make it seem like they may have appeared about the same time that the Laconian ship went through the gate. Or when it fired at the ring station. We don't have great data on timing."

"All right," Drummer said again. She was growing impatient.

"It's the rate, you see. The rates of quantum creation and annihilation are ... they're through the roof. The uptick is *massive*."

She was still struggling to get her mind around the idea that emptiness wasn't empty, but something about the awe in Tur's voice sent a chill down her back all the same.

"So you're telling me ... what exactly?"

"That the space near the ring started *boiling*," Tur said. "And we don't know why."

Chapter Twenty: Singh

Santiago Singh spent a very unpleasant few days dealing with the fallout from his newly announced security protocols for Medina Station. One by one, every bureaucrat and functionary called him to express their concerns over how the crackdown might negatively impact morale and efficiency on the station. However the conversations were phrased, what he heard in them was always the same. *The new rules will make people unhappy. They won't work as hard. Sabotage will increase. Are you sure we want to do this?*

His responses, however he put them, were also of a piece: *I don't care if people are unhappy about the new rules, if they fail to do their jobs, they will be fired, sabotage is punishable by imprisonment or death, yes, I'm sure.*

In High Consul Duarte's seminal book on logistics, he'd pointed out that of all the methods by which one can exert political and economic control over another state, occupation by military force was the least effective and the most unstable. The justification for occupation of Medina Station was that, as the checkpoint of all thirteen hundred colony worlds, it minimized the need for any further military action and let the imperial government move on quickly to economic trade and cultural pressure, which were much more stable long-term strategies for exerting control. And in fact, demonstrating to the people of Medina that the Laconian takeover would lead to better lives for all of them was the test case. If Singh could convince a station full of people bred for anarchy that imperial rule was desirable, the still-nascent colonies beyond the gates should be a piece of cake.

He understood all of this well enough. But it didn't change the fact that he'd had to spend his afternoon explaining to stupid, angry people why attempting to assassinate the governor of the station carried consequences.

When he cut the connection on what he hoped was the last of those complaints, he yelled out for someone to bring him coffee or tea or whatever else passed for a potable on that festering armpit of a station. No

one replied. Because Kasik was dead and he hadn't yet brought himself to assign anyone new to his duties. As if by keeping the dead man on the roster, some part of him still remained that history hadn't erased.

For a moment, the buzz of activity and conversation, irritation and confrontation that he'd cultivated since the incident slipped away, and he saw Kasik spitting raspberry jam that was really his brain and his blood and part of his tongue—

Singh lost a few seconds. When he became aware again, he was on his knees next to his desk, vomiting into his trash can. From the state of the bin, he'd been at it for a while. The smell and look of the mess set off a new round of vomiting that only ended when his stomach clenched up painfully on nothing and a thin trickle of bile bit at the back of his throat. Delayed shock. Trauma reaction. It was normal, he told himself. Anyone would go through it.

"I'm so sorry, Kasik," he said, face suddenly covered in tears for a man whose first name he couldn't even remember.

The comm unit on his desk politely beeped. "Leave me the fuck alone," Singh yelled at it.

"Admiral Trejo is here for you, sir," a carefully neutral voice replied.

"Here?"

"In the security lobby, sir."

Singh cursed under his breath, soft but vicious. He grabbed the liner out of his trash can and stuffed it into the recycler. The air probably still smelled of sick. He turned the air recyclers as high as they would run to cut it.

"Put him through in one minute, please," Singh answered, then used the sixty seconds to wash his face and rinse out his mouth. Trejo had returned to Medina. It could have meant a number of things, but all of them meant he wanted to have a face-to-face conversation instead of trading messages through the comparatively glacial security apparatus that surrounded official communications. And that meant talking about sensitive issues.

"Sonny," Admiral Trejo said as he walked into the room. "You look a fright."

"Yes, sir," Singh agreed. "I'm afraid that recent events have shaken me a bit more than I expected. But I'm getting it secured. Shipshape and ready to sail, sir."

"Have you slept at all?" Trejo asked. He sounded genuinely concerned.

“Yes, sir,” he said. And then, because it felt like lying, “Some, sir.”

“It’s hard losing someone. Especially someone you worked with closely.”

“I’ll be fine, sir,” Singh said. “Please, take my desk.”

Trejo’s smile was sympathetic as he sat. He took the offered desk. “I have good news for you, at least. I passed along your findings on the gamma-ray bursts through the rings, along with your recommendation about using a ship with an ultrahigh magnetic field projector stationed in the slow zone to control access and passage. Naval high command was very intrigued. They took it all the way to the top.”

The top meant only one person on Laconia. “I’m very flattered it got so much attention, Admiral.”

“He agrees with you,” Trejo said. His voice had a flatness that Singh didn’t entirely understand. His green eyes flicked up to meet Singh’s gaze and they stayed there. “They’re sending out the *Eye of the Typhoon*. It’ll take a bit for her to outfit. She wasn’t scheduled to come through for another four months, but you’ll have her with all deliberate speed. She’ll have Medina Station defense as her official mission, but holding the ring system using your new data will be part of her parameters.”

“Rear Admiral Song has that command, as I recall.”

“Yeah, that’s Song’s boat,” Trejo agreed. “But you’re still governor of Medina. You’ll have operational command over the defense of the station, and that includes determining when and if our new ring strategy is appropriate.”

“Yes, sir,” Singh replied.

“It’ll be heady stuff, knowing an admiral has to dance to your tune, Sonny. Just remember that this posting won’t last forever. Don’t make any enemies you can’t unmake.” There was a weight to Trejo’s words, like they carried more than just what they said. They landed on Singh’s chest like a gentle rebuke.

“Understood and appreciated, Admiral,” Singh said. “Will the *Tempest* remain here until the *Typhoon* arrives to take over?”

“No. We are moving up the timetable, per your analysis. The *Tempest* is leaving through the Sol gate in four hours. Unless you’ve reconsidered your position?”

Singh felt an offer in the question. This was the chance for him to say that he was out of his depth. That he needed backup and help. The

temptation to claim perfect fitness was strong, but he couldn't dismiss the fact that he was, in fact, compromised. The question was whether his own frailty was enough to risk giving Sol system more time to prepare. The most dangerous part of the *Tempest's* mission in Sol system was the transit through the gate and the hours immediately after it. The longer the enemy had to exploit that period of vulnerability, the less the time he'd won with his discovery of the gamma burst would gain them. He didn't want to undercut the advantage he'd just provided.

And still ...

He started to reply, but stopped when the bitter-lemon taste of bile crept up the back of his throat again. *Not now.* He swallowed furiously, hoping this would be enough to hold off yet another round of vomiting into his trash bin. Trejo's eyes widened with what looked like genuine concern.

"Sonny," Trejo said, "have you seen a doctor?"

"Immediately following the attack. I sustained no injuries beyond a bruise on my knee and a bit of pride."

"That's not what I mean," Trejo said.

"I'll be fine," Singh lied, but Trejo didn't call him on it. "I know that the ring emissions were never part of the defensive strategy before, but I find myself worried about leaving such a powerful tool behind."

"Understood. I'll be honest, I'm not totally happy moving the timetable up. Slow and steady, that's the strategy I like best. But there's nothing so far to indicate the locals have made any breakthroughs we don't know about. The high consul thinks we can afford to pull the *Tempest* out past the gate early. It does feel a bit like I'm leaving you here with your ass hanging out. But there is exactly one fleet in known space that poses a threat to our plans here. And it's bottled up in the Sol system. You won't need to worry about defending Medina from it at all, because I'm going to force them to fight me on their home ground. I don't expect the colonies are going to cause you any trouble a destroyer can't handle."

"I agree, sir," Singh said. "We'll hold and wait for the *Typhoon's* arrival, or word of your success in Sol, whichever comes first."

Singh expected this to end the conversation, and waited for Admiral Trejo to stand. Instead, the old man stared at him with thoughtful eyes until the silence had become uncomfortable. Etiquette dictated that he not close the interview until his superior dismissed him, so he stared back and tried for a vague smile.

When Trejo spoke again, his voice was lower. “Tanaka filed her report. She’ll be boarding a shuttle shortly to take up a post on the *Tempest*.”

“Oh,” Singh replied, hoping it came off as casual.

“Don’t misunderstand me. She’s a fine operator, and her experience is more than welcome there. But if there are problems with her, I would like to know what they are.”

“I’m sure her talents will—” Singh started, but Trejo cut him off without raising his voice.

“If she’s going to take a command role on my ship, I’m going to need to understand why you removed her from yours,” the admiral said, his voice as gentle as though he’d asked for the time. “That’s what I’m asking you for.”

“Yes, sir,” Singh replied. *If I understood it myself*, he thought. The fury at everyone and everything that had followed the attack had faded, leaving behind only a vaguely unsettled feeling, like the adolescent fear of forgotten homework. Like there was something that needed to be done, something that would cause trouble if it wasn’t, but he had no idea what the thing was or even how to find out.

“Anytime, Sonny,” Trejo said.

Singh took a deep breath that stuttered a little. He hated that it did. “It was my feeling, at the time, that failing to respond to the attack on my person, and by extension on the authority of the high consul and the empire itself, would only serve to embolden any dissident elements here on the station. I felt that a strong response was needed to enforce the message that this was now our station, that we weren’t going anywhere, and that any attempt to hinder our work would fail. End the idea of a rebellion before it could begin.”

“And you believe Colonel Tanaka didn’t understand or support this position?” Trejo asked.

“She counseled a more conciliatory approach. I believe her experience in the Martian military guided her here, but that it was not experience that translated well to this new situation. She disagreed, and stated that she would not support the new security measures, deeming them too harsh. I relieved her at that point.”

“Why did her considerable experience not translate, do you think?” Trejo asked. The words could have been taken as mocking or rhetorical, but something in the old man’s voice made it seem like genuine curiosity.

If there's no cover, the only thing to do is charge. How did he keep finding himself in these situations?

Singh cleared his throat. "Colonel Tanaka learned about rebel pacification by dealing with a belligerent but unaligned population. The Belters were *not* citizens of Mars, though they fell under Martian influence and regulation. To some degree, 'winning hearts' was always part of the mandate. She still thinks that way. She wants to approach this insurgency in that way. Crack down on only those involved in the attack, and attempt to win the cooperation of the rest of the populace through kindness."

"You disagree with this assessment," Trejo said.

"I do. By mandate from the high consul himself, all humans are citizens of the Laconian Empire. The people on Medina are not a neutral third party placed between us and an insurgent faction. They are *Laconians*, and the insurgents are not a foreign government resisting conquest, they are criminals. Any other reaction defies the imperial mandate and legitimizes them. I don't need to win their hearts. I need them to understand that all the previous political bodies and relationships are irrelevant. We are not conquering new territory, we are enforcing the law in our empire."

Trejo smiled. "That could have come straight out of a political theory class at the academy. I wasn't asking for a book report, Captain. Do you believe all of that is true?"

It was a strange question. "I wouldn't be here if I didn't, Admiral."

"It is certainly the official position of the empire, and accurately stated," Trejo agreed.

"Sir, if that's all, I—"

"Why," Trejo asked, as if Singh hadn't spoken at all, "did the high consul place you here, do you think?"

"Sir?"

"Your educational credentials are impeccable. I've read your paper analyzing Duarte's theories on empire through logistical control. And I'd bet even he was impressed. You attributed some truly unique ideas to his text that I'm pretty sure aren't actually in there."

"Thank you, sir," Singh replied, trying to keep it from sounding like a question and failing.

"But you did exactly one tour on a naval vessel prior to this posting. And there are probably a hundred more like me and Tanaka on Laconia who have actual combat-command experience. Why you and not any of them?"

Singh had wondered that himself. “I honestly can’t answer that, sir.”

“And that’s the only right answer, Sonny. No, you don’t know. But I’m going to give you a hint. Do you know how to polish a rock?”

“No, sir.”

“You put it in a tumbler with a lot of other rocks and some sand and you roll them around for a couple of weeks until all the edges are worn off and they’re nice and shiny. We’re taking control of thirteen hundred different worlds, and we’ve only got a hundred old farts like me and Tanaka, and a couple thousand university-educated greenhorns like yourself.”

Singh had no idea what a greenhorn was. It sounded like a Mariner Valley idiom. But the context was clear. And so was the point.

“Colonel Tanaka was placed here to—” Singh started.

“To rub some of the stupid off you. Tanaka’s been fighting insurgents since before you were born. She’s killed more people than you’ve met. But we’ve already got a Colonel Tanaka. Putting her in charge doesn’t create anything new. Hopefully this little dust-up has knocked some of your edges off, or this will be a waste of everyone’s time. Tanaka’s scheduled to fly out in an hour. I think you owe her a conversation.”

“Yes, sir,” Singh replied. It tasted like more bile in his mouth, but the admiral was right.

Trejo rose. The meeting was ended.

“Dismissed, Captain. Make sure Medina’s still here when I get back.”

“Understood, Admiral.”

The bravest thing would have been to go to the *Tempest*. The easiest thing, to record a message and send it through the Medina system where the security measures would forgive not having the conversation in real time. He split the difference.

The Belter whiskey that someone had left in his old cabin on the *Storm* tasted like acid and mushrooms, but Singh drank it anyway. The alcohol seemed to finally cut through the last of the bile in his mouth and throat. He kicked his boots off, propped his heels on his desk, and waited for the knot in his chest to loosen, even if only a little bit.

It should have been obvious from the start. Looking back on it, the only

thing Singh had to recommend him for the governorship was his absolute commitment to High Consul Duarte's vision. But that's all they'd asked from him. They needed to take the inexperienced true believers like himself and drop them into the deep center of the lake, then hope they learned enough to swim back to shore. And everything about Tanaka: her arrogance, her contempt for his inexperience, her refusal to just accept his orders at face value. All of those were *exactly* the reason she'd been placed under his command. Throwing her out in a fit of pique was the sort of adolescent behavior they were trying to burn out of his system.

He had fucked it up.

The fact that Admiral Trejo understood that he'd done it in the blind panic that followed his first time under fire was both a relief and a humiliation. It was also probably the only reason he hadn't been relieved of command. Trejo saw what had gone wrong and still felt like Singh had something to offer. That he wasn't fit for the rubbish bin just yet. Comforting and humiliating, again.

He took another drink of the whiskey. It left his throat warm. That was about the best he could say for it. That was enough.

There was another trap ahead. Singh found that he could sense it. He could feel Trejo's attention, waiting to see how he'd navigate his way out now that his mistake had been made clear. The admiral had practically ordered Singh to speak with Tanaka before she left, so that's where the trap lay. He had a dozen different impulses about what that conversation would be, and he second-guessed every one of them as quickly as he recognized them. This was his command. So it was his to lose.

Maybe the right thing was to be willing to fail honorably. Even if he did get sent home to Nat and the monster, the disgrace would be less if he knew he'd done the fully adult thing.

He pulled the screen off his wrist and flattened it out on his desk. "Colonel Tanaka, video and voice," he said to it.

"Tanaka here," she said a moment later. On the small screen, her face was compressed down to only the most prominent features. Dark, heavy eyebrows. Wide jaw. Flattened, slightly off-center nose. It made her look dangerous and angry. She was probably both right now.

"Colonel," Singh said, trying to keep his tone even and informational. He thought he mostly succeeded. A call to finalize some trivial bureaucratic details.

“Governor,” she said, actually achieving the emotionless affect he was only trying for.

“I spoke to Admiral Trejo about your transfer. He said he was happy to move you into a command position on the *Tempest*, and I did nothing to dissuade him from this.”

“Thank you for not attempting to torpedo my career,” she said, not sounding grateful at all. The fact that she didn’t say, *Fuck you, little man, you couldn’t have hurt me even if you wanted to* was as polite as this was likely to get.

“I want you to know that I recognize that in my heightened emotional state following the attack, I made some poor decisions, not least of which was removing you from your command.”

There was a pause. A fraction of a fraction of a second, but it was there.

“Really,” she said. The large eyebrows moved up a millimeter.

“Yes. And if I could take that back without compounding my error, I would. But the most important thing now, to both my staff and to the citizens of Medina, is the appearance of calm authority at the top. To make so drastic a move as relieving you only to rescind it would make us ... make *me* appear weak and indecisive. So your transfer will be recorded as a move to put additional combat experience on Admiral Trejo’s staff, now that we’ve secured the station and he’s moving into the attack on Sol. It will not put a blemish on your outstanding record. Unfortunately, my apologies and regrets will have to remain unofficial for now.”

Tanaka frowned, though it looked more like surprise than anger. “I appreciate that, Governor.”

“Good luck and godspeed in Sol, Colonel. We will all be waiting for word of your mission’s success. Singh out.”

He closed the connection and drank off the last of the terrible Belter whiskey. He wasn’t sure if it was the alcohol, but he felt like a weight he’d been carrying ever since landing on Medina was lifting. This was *his* station now. His command, to fail or succeed at entirely on his own merits. And now he felt that the worst mistake he was likely to make was behind him, and it hadn’t actually been all that bad.

Things could only get better from here.

Chapter Twenty-One: Holden

Rather than leave them sneaking into and out of the refugee camps in the drum or Laconian-assigned quarters, Saba gave Holden and the crew access to a smuggler's cabin: a six-rack berth his people had carved out of a service tunnel where the station records were out of date and missing. It was a tight fit, and Alex snored a little, but it was better than the alternatives.

The room where they spent most of their time had been meant for midlevel storage. Not the deep pockets of the generation ship traveling through the vast abyss between the stars. Not the immediate, day-to-day pantry of the men and women whose lives would begin and end in the journey without seeing either end. Built-in yellow guides marked where crates of tools and imperishable rations would have been stacked along the deck and walls. History hadn't taken the room that way.

Cushions of gel and fabric covered the floor around a half-dismantled holographic display that acted as a low table. The air recyclers were set to minimum to keep the usage footprint of the space as low as it could be, and a battery-driven fan moved the thick air. Lengths of printed textile—Holden couldn't tell if it was cloth or plastic or carbon mesh—draped the walls and rustled in the little breeze. He didn't know if those were functional somehow, or if the impulse to decorate interiors just outlived all political circumstances. Mostly, it reminded Holden of a Moroccan restaurant he used to go to on Iapetus, back when he'd been hauling ice for Pur 'n' Kleen.

Saba and four people Holden assumed were his lieutenants sat across from him and the crew and refilled their cups with a smoky tea whenever they got low. In addition to being captain of a supply ship called the *Malaclypse* that was stuck in dock just like the *Roci*, Saba was married to Drummer. At first, Holden had been worried that what he'd done with Freehold was going to haunt him, but when he brought it up, Saba had waved it away. *It happened in a dream*, Saba said, which was a little

confusing until Naomi told him it was an old-timey Belter idiom for *Don't worry about it*.

Even after a long life spent outside Earth's gravity well, Holden was impressed by all the things he didn't know.

"Perdón," a Belter woman said, squeezing her way past the guard at the door. "Saba? Are you ready for food yet?"

Saba mostly managed to keep his smile polite. "No, Karo. Bist bien."

The woman bobbed her hands, nodding like a Belter. She swept her gaze over the rest of them, but paused a little bit at the *Rocinante's* crew—Holden, Naomi, Bobbie, Alex, Amos, and Clarissa. "Any of you? We've got mushroom bacon."

Bobbie cracked her knuckles meditatively. Holden was pretty sure that was a sign of annoyance.

"That's fine," he said. "We're good. Thank you."

The woman bobbed her hands again and squeezed back out. It was the third interruption of the morning. That was a little strange, but Holden put it down to a level of general anxiety for everyone. With the occupying force settled in, the freedom Saba's underground had to operate was thin as a razor blade, but everyone still wanted to be doing something.

"I'm sorry," Holden said, shifting which leg was folded under him. If he was always going to have one leg asleep, better to alternate them, he figured. "You were saying?"

Saba leaned forward. It didn't seem like sitting on the cushions made his legs go to sleep, but he was younger than Holden by a decade or two. "We need to find the balance, sa sa? The more of our own that we build, the more there is for us to use. But the more there is for them to find."

One of Saba's lieutenants, who'd spent the morning arguing for building a fully separate comm system by threading hair-thin cables through the water system, cleared her throat.

"The way I see it, we serve three masters: making space for ourselves, making tools for ourselves, and keeping space and tools from the inners. We have three percent of Medina now set where security can't see it. We have support from the crew. We have transmission out to and back from Sol gate. Have to look at the margin of what we risk against what we'd get from it. All I'm saying."

"Well, sure," Holden said, and Saba tilted his head. In his peripheral vision, Bobbie leaned in. When he looked over at her, her expression was

empty, but he had years of experience to tell him she was evaluating something. A threat, maybe, except that she was looking at him.

Holden shifted his legs again. "It's just that anything we do, we have to assume it's temporary, right?"

"Can't build on stone out here," Saba said with a grin, but Holden was pretty sure he hadn't understood the point he was getting at.

"Medina is our station," Holden said. "We know it better. All the niches and passages, all the undocumented features. All the tricks and doors and corners. And that's going to be true right up until it isn't. These people aren't dumb. They're busy right now, and maybe they'll stay that way for a while. But sooner or later, they are going to get to know the station. Our advantage only lasts for as long as it takes them to learn. So whatever we do here, it shouldn't be planning for the long term. We don't have a long term. We've got a short term, and maybe a medium term. Like, *maybe*?"

Saba shifted, sipped his tea, and nodded. "Good point, coyo," he said. "Maybe also, we start looking at evacuation plans. How not to spend a long life in a jail cell or a short one in an airlock."

"Whatever goals we pick," Holden said. "I just don't think we should spend the extra effort to make it something that's going to last a decade when we're probably looking at less than eight or ten weeks of freedom."

The way he said it, it sounded like an apology. Saba rubbed his palm across his chin. The room had gone so quiet, Holden could hear the hush of the man's stubble against his hand even over the whirl of the fan. Eight or ten weeks of freedom. It was the first time anyone in the meetings had guessed at the time frame. Whatever little apocalypse took out the underground, Holden expected it would be less than a springtime back on Earth.

"Is fair point," Saba said as a noise came from the corridor. Voices. A thin-faced man with a scar over his left eye leaned into the room, looked around, and nodded.

"New reports from upstairs if you want them," Scar-eye said. "Doesn't look like much of anything new. Checkpoints still on the move, and they put some stupid coyo in their public prison for being out after curfew, is all."

"I don't think—" Saba began.

Bobbie interrupted him. "Maybe you should. We could take a break. Right, Holden?"

“Um,” Holden said. “Sure.”

Saba shrugged with his hands. “Bien á. Maybe bring in some lunch, yeah?”

The meeting shifted. It was all the same people in the same space, but the motion of it changed. Holden leaned in and kissed Naomi gently on the cheek. She leaned her head against his as if it were only affection.

“What the fuck is going on?” Holden whispered. “Did I do something to piss Bobbie off? Because I really try not to do that unintentionally.”

Naomi shook her head so slightly, he only felt it. “You’ll have to ask her what’s up,” Naomi said. “But you’re not wrong. It’s something.”

The conversations in the room rose and shifted, swirling like birds. A word or phrase that passed between Amos and Clarissa got overheard by one of Saba’s people, shifted what he was saying, and soon Saba mentioned it to Alex. *Controlling people is usually having stuff they want. Don’t want nothing, and they’re pretty much just down to hitting you until you do what they say* became *Was easier with the inners because they wanted to get rich and make rich-people toys* became *What do these Laconia coyos want, anyway? What do they think they do it for, yeah?* Everyone in conversation with everyone else, whether they were aware of it or not.

Holden watched it, listening and waiting for Bobbie to come over. If humanity ever developed a hive mind, it wouldn’t be psychic brain links that welded it together. It’d be gossip and cocktail parties.

“Hey, Holden,” Bobbie said, touching his shoulder. “Can I borrow you for a minute?”

“You bet,” he said, hauling himself up from the floor. Bobbie slouched out toward the corridor, and he followed. The air outside the room was cooler and seemed less like it had just come out of someone else’s lungs. The lighting was strung maintenance LEDs, harsh and bright. The walls were painted in a dozen different colors, guides to the pipes and conduits behind them. The map and the territory both.

Bobbie paused at the junction of a service crawl with the main corridor. Voices murmured behind them, too distant to make out, but present. As tight as the spaces were, she could have leaned against both corridors’ walls at the same time, one with each shoulder. She flexed her hands like a fighter about to go into the ring. There had been a time, when they’d first met, that he’d found Bobbie’s physicality intimidating. Over the years, she’d grown in his mind into a place where she was only herself. Every now and again,

he'd be reminded that she was a professional warrior and well trained in violence.

Her expression was intense, focused. She could have been thinking her way through a hard problem or restraining herself from a killing rage. The two looked similar with her.

"Hey," Holden said. "What's on your mind?"

Her focus shifted to him, and she nodded like he'd said something worth agreeing to. "So are you here to help this or hinder it?"

"Well," Holden said. "I would have said help until you asked me that, but now it's feeling like a trick question. Am I missing something?"

Bobbie put out her hand palm first, like she was telling someone to slow down, but it seemed intended as much for herself as for him. "I'm thinking this through while I'm saying it, so just ..."

"Got it," Holden said. "Whatever it is, take a swing at it. We'll work it out."

"Other people? People like me? We can show up and maybe not have an effect. That's not how it is with you. Either you're helping or you're holding things back. There's no middle setting."

A little discomfort tugged at him, and he crossed his arms. "Is this ... Bobbie, is this about you being the captain of the *Roci*? Because that hasn't changed. Naomi and I—"

"Yes," Bobbie said. "It's exactly like that. Look, you've seen all those people who keep interrupting the meetings, right? They're all just swinging by to be in the room for a minute, even if it's something they could have done on hand terminals. Or not done at all."

"I know the ones you mean," Holden said. "But that's not me."

"That's *absolutely* you. James Holden, who led the fight against the Free Navy. And stopped Protogen from killing Mars. And captained the first ship through the ring gates. Brought people together on Ilus in the face of fifty different kinds of shit falling apart. You're in the center of everything just by walking into the room."

"Not because I like it," Holden said.

"When you showed up, Amos and I were getting ready to fight our way into all this. But then there you were, and you got recognized, and now we're all sitting in the absolute center of the conspiracy. Even if I'd pushed my way into this, there would have been days, maybe weeks, of proving to Saba and his people that they could trust me. You got that for free, and the

rest of us drafted off you. I came in as the captain of the *Rocinante*, and it wasn't enough to be taken as seriously as you got for free."

Holden wanted to object. He could feel the denials welling up in his chest, but he couldn't quite bring himself to say them out loud. Bobbie was right.

"I have an idea how we gather intelligence on the Laconians," Bobbie said. "It's the first step that we need. But we have to move quickly. Saba and his people? They think this is like going back to before there were gates. No matter what they say, they think this is going to sustain and become a way of life for them the way it used to be. Did you notice how they've started calling the Laconians 'inners'?"

"Yeah, I did."

"But you were right in there. We're looking at a really small window. So if we're going to do what I think we really need to do? It has to be your idea."

"Okay, little lost here. Which idea of mine are we talking about?"

"I'm talking about you taking the operation I have in mind, waltzing back in there, and presenting it like you just came up with it yourself."

Holden didn't know whether to laugh or scowl, so he did a little bit of both.

"No, I'm not going to do that," Holden said. "You say what you need to say, and I'll back you. But I'm not going to start taking credit for your proposals."

"If it's my idea, it'll be like when we showed up," Bobbie said. "I'll have to fight to prove it. If you do it, they'll just listen. Coming from you will give it weight that just being the right damn thing won't."

A clank came from behind them, a hatch being opened or a tool being dropped. He didn't turn to look. The unease he'd felt before shifted, changed its nature, but it didn't go away.

"I don't like that," Holden said. "I hate the idea that you're being treated as anything less than me. It's bullshit. I'll tell Saba that—"

"You remember the last time we went out to karaoke with Giselle? Right before Alex and she called it quits?"

Holden blinked at the non sequitur. "Yeah, of course. That was a terrible night."

"You remember the song she sang? 'Rapid Heartbeats'?"

"Sure," Holden said.

“Who was the singer? On the original, I mean. Who sings that one?”

“Um,” Holden said. “The band is Kurtadam. The singer’s Peter something? The guy with the one steel eye.”

“Pítr Vukceovich,” Bobbie said, nodding. “Now, who plays bass?”

Holden laughed, and then a moment later, sobered.

“Right?” Bobbie said.

“Yeah, okay. I got it. I don’t like it, though. I’m not more significant than anyone else. Acting like everything important has to go through me or else it’s not legitimate ... I don’t know. It feels like I’m being an asshole.”

Bobbie put a hand on his shoulder. Her eyes were calm, and her smile was a straight line. “If it helps at all, I’m thinking about all of this as me using you as a tool to achieve my own ends. It makes me less angry that way.”

They talked for another twenty minutes, Bobbie laying out her plan in enough detail that he could introduce it. He asked a few questions, but he didn’t need many. The sense of working together with her had a weird nostalgia. As if the gap between arriving at Medina and now had been years instead of days.

Large, sudden events did that. They changed the way time passed. Not technically, maybe, but as a measure of who he and Bobbie were to each other. And to themselves. A month before, Laconia had been one background issue among thousands. Now it was the environment. A truth as profound as the EMC or the union. More, maybe.

Back in the meeting room, the food had arrived. Recycled wheatpaper bowls filled with rice noodles and chopped mushroom bacon and fish sauce. It smelled better than it should have. Bobbie went to sit by Alex and Clarissa, folding herself gracefully down beside them. Holden felt the impulse to go sit there too, to be part of the family again. And he could have, except he also sort of couldn’t. Would he be doing it to help or to hinder? Because he couldn’t do both. For the first time, he felt what stepping back from the *Roci* had cost him.

And still, he couldn’t regret it.

“All well?” Naomi asked, snaking her arm around his waist. “You look

thoughtful. Are there thoughts?”

“There were a few, yeah,” he said. “Mostly that I’m a tool, but in a useful way.”

Naomi sat with that for a moment. Saba caught sight of them and waved them over. Two bowls with forks and bottles of beer were waiting on the low table for them.

“Should I be offended on your behalf?” Naomi said.

“Nope,” Holden said. “You should come eat.”

Saba leaned forward as Holden sat. “This is good. One thing we can say about Medina, the ingredients are always fresh.”

“True,” Holden said. “But they’re usually still fungus and yeast. Vat-grown bacon is ... well, it’s just its own thing. So, Saba, I had an idea I want to talk to you about ...”

OceanofPDF.com

Chapter Twenty-Two: Bobbie

We can't place a physical monitor on the data connection to the Laconian ship," Holden said, just the way she'd told him to. Saba had chosen the people to be briefed, selecting them by some means Bobbie didn't know and didn't care to guess. They were watching Holden intently. It felt weird that the role of the great James Holden, come to lead them to glory, was being played by the Holden she knew. Apart from the coincidence of naming, the two didn't have much in common. "We need to passively monitor incoming and outgoing signal without detection. Mirror the data."

"For for?" a tall, stick figure of a man said. His name was Ramez and he was in Medina Station's technical support department. According to Saba, he had the run of the ship, their insider on this mission. Bobbie didn't like him. "Alles la thick with encrypt. Better off reading their coffee grounds."

"Decrypting it is a later problem," Holden said, not giving too many details of the plan away to any one person. Bobbie had a decent idea, but she was still working out the details of how to get the decryption codes. The fewer people knew the details, the less likely it was to get out before she was ready. "Right now we just want to get as much as we can so that we can decrypt it when the time comes. The important aspect right now is that we get the signal without anyone knowing it's happening."

"Gotta look inside the pipe without touching the pipe. Que pensa?"

"I've brought along my team leader and technical expert to explain the how of the thing," Holden said, nodding to Bobbie and Clarissa. "Captain Draper?"

Bobbie gave him a wink only he could see. Say what you would about the man, he did take to the role of meaningless figurehead with panache.

Bobbie walked to the front of the room and pulled up a volumetric map of Medina on the wall display behind her.

"The *Nauvoo* was intended as a generation ship," she started.

"Fuck is a 'no view'?" a Belter woman asked. The others chuckled.

“Read some fucking history once,” Saba said to her, then nodded to Bobbie to continue.

“They knew she’d be picking up signals from farther away than anything had ever needed to before,” Bobbie said. She zoomed in on Medina’s comm array. “So the comm system is massively overpowered, *and* much more sensitive than anything on a commercial or military vessel.”

Ramez nodded and shrugged expansively with his long hands. “We don’t even use most of that shit. No one talking from far away in here.”

He meant inside the slow zone, and he was right. Nothing was ever more than half a million clicks from Medina. The physical boundaries of the space prohibited it.

“True, but the equipment is still there. And up on that comm array is a signal sniffer sensitive enough to track a single photon through a fiber bundle a meter thick,” Bobbie said, zooming in on the technical map behind her. “But we can’t just steal it. Claire?”

Clarissa pushed herself out of the corner she’d been hiding in and came to stand next to Bobbie. She wore a mechanic’s jumpsuit with the name TACHI on the back, and had her hair pulled into a tight bun. With her gaunt cheeks and sunken eyes, it made her look severe and impatient.

“Even though this array isn’t in use,” Clarissa said without preamble, “it’s still hooked to the primary comm system. If we start unplugging things, alarm bells are going to go off up in ops. So we need to put the circuits into a diagnostic shutdown before we physically yank the parts.”

“Fuckonians all over in ops now, *ninita*,” Ramez said. “Watching everything all the time, them.”

Clarissa nodded her agreement, then said, “And that’s where you come in. We need to get you onto the ops deck to shut down the panel long enough for us to do our work,” she said. “And also if you call me ‘little girl’ again, I will hurt you.”

“Is that right, *ninita*?” Ramez said, his grin turning condescending.

“No,” Bobbie said, stepping toward him. “No, that’s not right. Pulling that gear will be delicate work. I can’t risk her damaging her hands before we get out there.” Bobbie took another step into Ramez and stared down at him. “So *I’ll* hurt you. Mao’s my second on this. Don’t make me beat some respect into you, *ninito*.”

She glanced over at Holden. He looked shocked, and maybe a little sad.

She wondered how he would have handled it, back before. It was so strange to be doing all this in the same room with each other.

Ramez threw a look to his buddies on the crates. No one stepped up to back him up. Saba was smiling and making a *Let's get on with it* circular motion with his hand.

"Sabe," Ramez said, looking to the side the way abashed primates had since the Pleistocene. "Just for fooling, que?"

"Sa sa," Bobbie replied, then switched the screen from the volumetric map over to her mission plan. "Here's the rundown, including precise times for each thing to happen. Mao and I will be on the outside of the station for most of this, and we can't afford to do any broadcasting out there, because the Laconian sniffers will almost certainly pick it up."

"I'll be calling up to ops using an unlocked hand terminal that Ramez here will get for me," Holden said, nodding at the man as an invitation for him to nod back. "We're picking a time when Daphne Kohl is the duty officer. She knows me now, and I'm thinking she'll understand what we're trying to do without me having to explain it. Comm discipline is in full effect, the assumption is everything is heard by everyone."

"So that call between Kohl and Holden is what we're all listening to," Bobbie said. "We'll pass out a list of code words Holden will use during the call as signals. This is our only method of coordinating the action, and there's no way for us to signal an abort or call for help. Our backup plan is everyone does this right the first time so we don't need a backup plan. Understood?"

"Lot of risk for a dump of gibberish we can't make sense of," Ramez said.

Bobbie felt a little flush of annoyance at the man. "The more we have, the more likely we find what we need in it when the encryption problem gets fixed," she said. "We start where we can, and that's this. Are we all clear?"

A murmur of *dui* and *sabe* and *sa sa* rippled through the room.

"Outstanding," Bobbie said. "Let's get to work."

The slow zone or the ring space or the gate network. No matter what you

called it, it was fucking weird.

Bobbie and Clarissa exited the drum section of Medina Station using an old maintenance airlock that Saba swore wasn't monitored from ops. They were wearing emergency vac suits, the so-thin-they're-barely-there type whose only purpose was keeping the wearer from dying of asphyxia before help could arrive. They were bright orange and yellow to make the wearer easy to find in smoke or against the black of space. They had large flashing lights on the helmet and shoulders to aid rescue workers, but Bobbie had smashed those with a wrench before they put them on. Bad enough to be a brightly colored blob climbing up the outside of the station. No reason to flash a distress signal too. Under normal circumstances, going outside a ship or station wearing the emergency suits was asking to be cooked by radiation. The cheap throw-away suits had almost no shielding to them.

But the slow zone was fucking weird.

There was literally no radiation in the ring space that humans didn't bring in with them. No background radiation, no solar wind, nothing. Just a massive, unnaturally black void all around, defined only by the distant and faintly glowing rings equally spaced around it and the blue sphere of the alien station at the center where they'd had the rail-gun emplacements.

Bobbie and Clarissa rode the outside of the massive, spinning drum section of Medina inside the old airlock. The indicator of their motion being the occasional distant ring moving past the black window of the outer airlock door, and the fact that something kept trying to shove them out the door at a third of a g. Bobbie had them both tethered to a clip inside the airlock so they wouldn't be hurled into the strange non-space outside.

A large rectangular structure whipped past the outer airlock door. Bobbie pressed her helmet to Clarissa's and yelled so that sound would conduct directly. "That's one of the exterior elevators. We go for the next one."

Clarissa nodded, wide-eyed, and braced for the jump. Outside of the drum section of Medina, two structures ran the entire length of the ship from the engineering deck aft of the drum to the ops deck in the bow. They housed machinery, conduit, and a pair of elevators for moving from one zero-g section to the other without passing through the drum itself. Bobbie and Clarissa planned to use one of them to climb the station up to the comm array on the nose, and back down to the Laconian ship docked at the stern.

Bobbie opened the mesh bag at her hip, checking again that she had

everything the same way she had a dozen times before. Spare air bottles for herself and Clarissa. They'd be outside for hours making the long climbs. A magnetic grappling gun with high-tensile cable and a winch. And finally, a fat black recoilless handgun that one of the Belters had managed to hide from the Laconian weapon sweeps. If they actually needed to use it, the mission was fucked anyway, but there was a dignity in going down fighting that appealed to Bobbie's romantic notions.

She hooked the emergency cable on her suit to a loop at Clarissa's waist, then unhooked herself from the airlock. The station tried to throw her out the door, but she grabbed the lip of the outer airlock with one hand and held on. In the other hand, she held the grapple gun. Behind her, Clarissa had one hand on her shoulder, and one hand on the bulkhead.

"Three, two, one, go!" Bobbie shouted, hoping enough sound would travel up Clarissa's arm. She launched herself out the outer airlock door by releasing her grip on it, and was shooting off into the void at 3.3 meters per second.

The massive rectangular structure of the maintenance shaft rushed toward her, and she fired the magnetic grapple into it as she passed. If the grapple failed to connect, they'd keep flying off into the empty space of the slow zone until they ran out of air and their lifeless bodies eventually flew into the eerie curtain of black at the edge of the alien space. Dangerous, but no more so than a challenging free climb back on Mars. She didn't even think about it. Her eye spotted the place she wanted the grapple to go, her hand and arm did the rest. The grapple landed less than half a meter from the spot she was aiming for. Like riding a bike.

The grappling line and the leash that connected the grappling gun to her suit snapped taut and pulled her in a fast arc around the maintenance shaft, dragging Clarissa helplessly behind. Bobbie started up the winch, pulling them closer as the speed of their arc increased. Just before impact, she bent her knees and activated her mag boots. The landing was going to hurt a bit.

She hit the metal surface of the maintenance shaft like the tip of a whip being cracked, and let the impact fold her knees up into her abdomen. Clarissa slammed into her back, and it felt like someone dropping a bag of cement on her from a couple stories up. Bobbie rolled with it, slapping the decking with her hands to activate the glove magnets, and hung on.

A few punishing seconds later, they were on the side of the maintenance shaft, all the violence of their motion gone, having been converted into

lightly sprained knees and a collection of bruises.

“Ouch,” Bobbie said, and floated motionless for a few seconds, tethered to the shaft by only one gloved hand.

“Yeah,” Clarissa replied, faintly, through the helmet she had against Bobbie’s back.

Bobbie pushed her helmet against Clarissa’s. “It’s a long climb, but at least there’s no gravity to fight. You up for this?”

Clarissa answered by unhooking the tether, and pulling herself up the flat gray wall of the shaft.

“Alrighty, then,” Bobbie said, and followed.

Two hours and an O2 bottle change later, they floated near the massive Medina comm array. A bewildering cluster of antennae, dishes, and radio broadcast towers, and at its heart sat a laser powerful enough to send messages back to Earth from a hundred light-years away. It had never been used.

“I remember when that almost ended all human life,” Clarissa said, pressing her faceplate to Bobbie’s. “It doesn’t look so scary now.”

“I’ve heard that story,” Bobbie replied. “Wish I’d been here to back you guys up in that fight.”

Clarissa shrugged. “The story’s more fun than the actual experience was. You didn’t miss much.”

Clarissa pulled herself over the rigging of the comm array, coming to a stop next to an oversized receiver dish. She pointed at an access panel below it, then flashed the Belter sign for *This one*.

Bobbie nodded with one hand, then tapped the side of her helmet. *Now we wait for word from Holden*. She turned on the small emergency radio in her suit, already tuned to the channel Holden would be using to call Daphne Kohl up in station ops, and waited. Clarissa stared at her across the vacuum between them, motionless and patient as a hunting cat.

The minutes dragged. When her radio crackled to life, Bobbie found herself grinning. “Medina control, this is workcrew kilo alpha, do you copy?”

Bobbie could only hear Holden’s side of the conversation, so there was a long pause and then his voice again. “Copy that. Can I get Chief Kohl on the line? Gotta route some repairs through her office.”

Office was their code that meant Ramez was outside of ops, waiting for permission to enter, so the plan was proceeding, and waiting only on Kohl’s

cooperation.

“Hey, Chief. Good to *hear your voice* again,” Holden said, hitting the words hard. He hadn’t identified himself by name, and he wouldn’t. If Daphne Kohl didn’t pick up on what was going on, they’d scrub the mission. If she raised the alarm ... Well, that would be an interesting problem. “Working with Saba down here in electrochemical. Tracking a grid problem that Laconian death ray caused, and we’d love to pull a panel up there to really nail it down.”

And here’s where the most dangerous part of the plan happened. It wasn’t flying through space on a tether, or climbing up the outside of a massive station wearing the thinnest and crappiest vacuum suits. It wasn’t even going to be later, when they climbed down to the Laconian ship to hook in their signal sniffer, hoping no one was watching the outside of the dock. It was here, where Holden was counting on his voice, Saba’s name, and the mention of Laconians to signal Kohl that they were up to no good and needed her help.

And more than that, counting on her Belter pride being stronger than her fear of execution by their Laconian masters. Because if any of those things weren’t true, Kohl could refuse them, and that was the end of the plan. Or worse.

Bobbie waited a very tense minute of radio silence, and then Holden said, “That’s great. I’ve got a tech heading to ops to pull that panel, if you can let him in. He’ll take a gander at our glitch and get out of your hair.”

Gander. Code for Go in five.

“Copy that, Chief. We appreciate the patience while we sort this out.”

Bobbie gave Clarissa a thumbs-up, then flashed her five fingers. Clarissa nodded with her fist, then started pulling tools out of the mesh bag at her hip.

First thing down, Bobbie thought. Just a two-kilometer climb aft and planting a bug on a Laconian destroyer without getting caught left to go.

With Medina Station functionally motionless in the slow zone, it was less of a climb than a mag-booted shuffle down the two-kilometer length of the maintenance shaft. Bobbie pulled the blocky module containing the field-strength sensor on a short leash behind her. It didn’t have much mass, but she’d taken it without conversation when she’d looked through Clarissa’s visor and seen the technician’s complexion going a sickly gray. Other than jumping out of a rotating airlock, they hadn’t done anything

particularly taxing, but it was pretty clear that Claire was already running on fumes.

As they got closer to the engineering-and-docking-bay section of Medina, the Laconian ship came into view around the curve of the station. Bobbie couldn't help but whistle her appreciation of the beauty of the thing. Say what you would about Laconian authoritarianism, their engineering included a lot of aesthetic beauty in its design.

The destroyer—Holden had called it the *Gathering Storm*—looked like a natural crystal formation that someone had chipped into a knife. The colors were all translucent pinks and blues, faceted like a gem. She spotted something at the tail that probably served as the ship's drive cone but didn't look anything like the UN or Martian designs she was familiar with. The nose of the ship ended in a pair of sharp projections, like a dagger point with a channel cut down the center that left her almost certain it was a rail gun. If the ship had torpedo launchers or PDCs, she couldn't see them.

The ship was so strange, so unlike anything humans had ever designed or flown before, that if it had docked and green three-eyed aliens had walked off, it would have felt more appropriate than the humans that actually flew her.

Clarissa stopped and turned, so Bobbie yanked the sensor array to a stop on its leash, then pushed their two helmets together.

"There," Clarissa said, pointing to a maintenance access hatch that looked exactly like a hundred they'd already passed. "That's the router that feeds from the dock into the station network."

"You're sure?" Bobbie said, looking around at all the other hatches.

Clarissa didn't answer, just rolled her eyes and took the leash. She pulled the sensor array down and attached it to the hull, right next to the hatch. She pulled a few leads from the box and plugged them into slots inside the hatch, then stuck a hand terminal on the side of the array and spent several minutes going through what looked like menus. Bobbie replaced both of their air bottles while she worked.

A few minutes later, Clarissa stood up and gave her the thumbs-up. Bobbie looked over at the massive blade of the Laconian destroyer. If anyone on it had seen them working, the ship itself gave no hint. Clarissa walked over holding her hand terminal and touched it to the side of Bobbie's helmet. Her HUD snapped on, and a wall of text rolled past. The signal traffic between the destroyer and the local decrypt facility, complete

with routing flags and timestamps. It was still locked behind military encryptions, but everything that the *Gathering Storm* sent down to Medina and everything it got back was here, and the underground was skimming a copy of all of it.

“Huh,” Bobbie said to no one. “I honestly thought that would be harder.”

Chapter Twenty-Three: Drummer

The ship came through the ring like an old video of a whale breaching the surface of the sea. The thousand kilometers of the ring gate was tiny in the scale of the solar system, huge by human measure, and the Laconian battleship fit between the two—too large to be comfortable in one, too small to fit well in the other. Its design seemed to come from the same uncomfortable place, neither the now-familiar eeriness of the protomolecule nor the history of human manufacture, but both and neither. Drummer watched the observations feed again and again, and it made her skin crawl a little every time.

She wasn't ready. Rock hoppers full of gravel were burning hard for positions that didn't matter anymore. The EMC fleet was consolidating around the inner planets and the Jovian system, but with days—sometimes weeks—left on their burns. The void cities were looping down to meet them. All of it preparation for tactical situations that weren't on the board anymore. Duarte and his Admiral Trejo had stolen the tempo. She had to make sure the price would be higher than they'd intended to pay.

"Madam President," Vaughn said. Drummer watched the *Tempest* emerge through the gate again before she spoke. It was astounding to her that something so large could make it through the gate at all. It looked big enough to break the safety barriers with its own mass and energy. Maybe there would have been a way to use that with Laconia the way they had with the Free Navy. Except that the fucking thing was already through the gate.

"Vaughn," she said, not looking back at him.

"Communications is asking for your decision on the repeater," Vaughn said.

She took a deep breath, let it out slowly between her teeth. There were thousands of radio signal repeaters scattered through the system, but she knew which one Vaughn meant. Their clandestine traffic to and from

Medina—Avasarala's gift to her—ran through a low-energy repeater that was floating dark outside the ring gate. From Medina, its signal was weak and the wavelengths it jumped among similar enough to the gates' usual interference that it was easy to overlook. From normal space, it was more obvious.

And the closest ship to it right now was the *Tempest*.

She could order her communications forces not to use it. That was easy. But the EMC intelligence forces also had access to it. And Saba's underground. The more people who could make a mistake, the more likely that something would go wrong. And it was easy enough for her to shut it down. One signal packet would do it, like toggling a light off. It would go into a passive listening state, and someone would have to know where to look for it to register as more than a grain of sand floating in the unimaginably vast ocean of the void.

Going dark was the right thing to do. But she rebelled at it.

"What's the point," she said, "of having something you can't use? Functionally, it's the same as not having it." On her screen, the loop ended and began again. The *Tempest* rising up from the gate.

"Preserving something to use at the right time isn't nothing, sa sa que?" Vaughn said.

"Was being rhetorical," Drummer said.

"Apologies," Vaughn said.

"Tell them ..." It was more than her window into Medina. It was her link to Saba. What if he needed to reach her? What if something happened, and his call for help died in silence because she was being too careful? Loneliness widened in her chest, stretched until it felt bigger than she was. Empty. "Tell them to shut it down. Save it for a rainy day."

"Yes, ma'am," Vaughn said, and turned to leave.

"Have you ever seen rain, Vaughn?" she said, stopping him. Giving herself a few more seconds with the connection to Medina and Saba still there. Even if she couldn't use it.

"No, ma'am. Never been to Earth. Never plan to."

"'Rainy day,' though. We still say it."

"Inner planet cultural imperialism is in everything," Vaughn said.

"Rain isn't just for inners. It rains on Titan too. It's methane instead of water, but you can see it if you're in the domes there. I spent my madhu chandra week there. A billion dots on the surface of the dome with the

orange clouds behind it? They look like tiny dark stars. If you can see them. Saba's distance vision isn't good. He couldn't see them. But I could."

"If you say so, ma'am," Vaughn said. Either he was mildly embarrassed for her, or she imagined he was. *Well, fuck you too*, she thought, but didn't say it in case it was just her.

"All right," she said, turning back to her screen. "Send the order."

Vaughn didn't answer, just walked out and closed the door behind him. She watched the *Tempest* pass through the ring gate one last time, looking for a clue in it. Or a ray of hope. She didn't see one, and she closed the recording down and opened the other one.

This is Admiral Anton Trejo of the Laconian Imperial Navy, and high commander of the Heart of the Tempest. I am presently on a mission to secure Laconian interests in Sol system. We recognize the deep cultural and historical importance of Sol system, and hope that this transition can be made peacefully and with the minimum of disruption. In the event that local forces resist, I am prepared and authorized to take any actions necessary to complete my mission. High Consul Duarte and I extend our best wishes to the local residents, and ask that you contact your governments to urge them to act in the name of peace. Violence is always a loss, and the measure of that loss is entirely in your control.

The false gentility of the threat made her wish he'd just said he'd burn their cities and take their children. It would have felt more honest.

People's Home was on its braking burn to meet with the EMC's second fleet, where Guard of Passage already waited. Independence was already with the first fleet and Jupiter. The newest void city—Assurance of Peace—was half built at the Pallas-Tycho shipyards and wouldn't be ready for another year, assuming that they had another year.

The unspoken truth was that the union had commissioned the void cities as a permanent response to the colony worlds' interest in building their own fleets. A void city couldn't control a whole solar system, but it could command a ring gate. Or that's what Drummer and the union board had assumed. Now, People's Home was only a battleship. A massive one, with greenhouses and schools, children and common space, universities and research labs. But the prospect of violence meant that none of that mattered. People's Home was a delivery system for rail guns, missiles, PDCs. And she would drive it down to protect Earth and Mars, and be protected by their ships. She'd hate everything about it, but she'd do it.

And goddammit, she'd have to smile while she did.

The under-burn configuration of People's Home put the meeting rooms down near the massive array of Epstein drives. The EMC was represented by Admiral Hu of Mars and Undersecretary of Executive Affairs Vanegas. Chrisjen Avasarala sat in a wheelchair at the back of the hall, eating pistachios and pretending to be dotty so that people left her alone. The lights had been set to a warm cut of the spectrum that was alleged to match a summer afternoon on Earth, and the air smelled of cut cucumber and soil. A reassuring environment that would hopefully affect the tone of the event, even if it was all engineering. The reporters and dignitaries on the formed bamboo benches all wore formal suits and dresses, as if a press conference were the same as going to church.

Maybe it was. Drummer had read somewhere that newsfeeds were where secular societies went to find out what cultural narratives were important and what could be ignored. There were thousands of feeds streaming right now, all around the system, with every variation of the ways to make sense of the history they were living through. In most, Laconia was an invading force to be resisted, but there were people who said Laconia was a liberating influence, an end to the oppression of the EMC and the Transport Union. Or that they were the true spirit of Mars, betrayed by the old congressional republic and now returned in triumph. Or that they were unbeatable, and capitulation was the only choice. Put a dozen people in front of their cameras, and you'd wind up with thirteen opinions. None of them would matter as much as hers, because she was the president of the Transport Union, and that, despite all her intentions and efforts, meant she was a war leader now.

In the green room, Vanegas was getting his makeup freshened before they went out to the cameras. Hu put down her coffee as soon as Drummer stepped into the room and hurried over to her, a grim expression on her face.

"President Drummer," Hu said, "I was hoping I could speak with you about the board's strategic cooperation documents?"

A steward led Drummer to a chair. A technician swung in beside her with a palette of cosmetics in his hand. She didn't have much use for makeup, but she didn't want to look sickly in the feeds either.

"I haven't seen the new draft yet," Drummer said, trying not to move her face.

“Santos-Baca is insisting on the chain of command passing through a joint committee,” Hu said. “That’s not coordination. That’s making the EMC a branch of the Transport Union.”

If they kill us all, Drummer thought, this will be why. Not their technology, not their strategy, not the invisible cycle of history. It’ll be our inability to do anything without five committee meetings to talk about it.

“I haven’t read the draft, Admiral. As soon as we’re done here, I’ll have them get me a copy. I don’t want to get this muddy any more than you do.”

Hu nodded sharply and smiled as if Drummer had capitulated. The technician touched her cheeks with a rouge brush and considered her like she was a painting. She had to fight the impulse to stick her tongue out at him.

And then it was time. Vanegas walked out first, and then Hu. They took the podiums to either side. Drummer took the center. The podium’s screen threw up an image visible only to her, running through the lines of the speech. She lifted her chin.

It didn’t matter how she felt. It didn’t matter what she thought. All that counted right now was how she looked and sounded. Let those carry confidence, and she could find the real thing later.

“Thank you all for coming,” Drummer said. “As you know, a ship originating in Laconia system has now made an unauthorized transit into Sol system. The union’s stance is unequivocal on this matter. The Laconian incursion is illegal. It is a violation of the union’s authority and the sovereignty of the Earth-Mars Coalition. We stand as one body in the defense of the Sol system and all its citizens.”

Drummer paused. In the back of the group, Chrisjen Avasarala stood up from her wheelchair and dusted the pistachio bits off her sari. Her smile was visible even from here.

“And the union,” Drummer said, “will dedicate all its resources to the defense effort.”

Just like you told us to, you old bitch, she thought. She didn’t say it.

In her dream, Saba was dead.

She didn’t know how he’d died or where, and with the non-logic of

sleep, she didn't question that. It was simply the truth: Saba was dead and she wasn't. She'd never see him again. She wouldn't wake up beside him. The rest of her life was emptier and smaller and sadder because of it. In the dream, she knew all of that. But what she *felt* was relief.

Saba was dead, and so he was safe now. Nothing bad could happen to him anymore. She couldn't fail him or abandon him or feel the weight of his disappointment. She woke into darkness, a moment's confusion, and then a wave of overwhelming guilt. The darkness, at least, she could control. She moved the cabin lights up a quarter. Dim gold, faint enough to leave everything in monochrome.

She could feel the thrust gravity when she turned. The absence of even trace Coriolis telling her what she already knew. She wanted to send a message out. To tell Saba she was thinking of him, and not quietly longing for the failures that would lose him forever. But she'd cut that line of communication, and having a weird subconscious wasn't a good reason to change that policy.

Instead she stretched in the near dark. Only half of her sleep cycle was done, but she wasn't interested in diving back into the pillow. Instead, she showered and ordered up a bulb of tea and a tortilla with fruit jam. Comfort food. Then she checked the system map.

The *Tempest* was still out in the vastness between the orbits of Uranus and Saturn. A billion and a half kilometers between the ring gate and the first human habitats of any real size, even if Saturn and its moons were at their closest. Having come through the gate so much earlier than she'd hoped, the *Tempest* wasn't burning hard for the inner solar system. At its present acceleration, it would take weeks to reach her. Drummer pulled on her uniform and went out into People's Home. The tube station was near her quarters. The void city knew where she was and arranged a private car for her without her even having to ask for it. Her security detail shadowed her with the practice of years. Even at the height of a shift change, she moved through the city like it was a ghost town. Only the litter and smell of bodies and old curry in the tube lingered as a promise that she wasn't as alone as she felt.

The arboretum was a restricted-access zone. Some of the trees were experimental, and being in a high-traffic area would have affected the data. But one person or a handful? That was within tolerance. It was warm there, the air thick with moisture and the novelty of oxygen that had just been

breathed out by another living thing. It was a strange place, exotic and surreal. Like something out of a child's fantasy.

Usually, she was the only one there.

Avasarala sat in the shade of a catalpa. Her hands were folded in her lap. Her eyes were unfocused until Drummer stepped onto the black rubber walkway in front of her.

"The fuck are you doing here?" the old woman said. "Don't you sleep?"

"I could ask you the same," Drummer said.

"I don't sleep anymore. It's one of the things you lose at my age. I'm not incontinent yet, though, so I don't get to bitch."

Drummer leaned against one of the trees, folded her arms. She didn't know if she was pleased the old woman was there, or annoyed by her, or both. "Is there a reason you're still on People's Home?" she asked, but her voice wasn't biting.

"Thought I might need to firm up your resolve. But I didn't. Now I'm only here because I hate fucking space travel. You're going my way. I'll get out when the last leg of the trip home is shorter."

"So not just looking to stick your nose in my business?"

"Not until you fuck up," Avasarala said. "Sit down, Camina. You look exhausted."

"No one calls me that, you know," Drummer said, but she sat on the bench at Avasarala's side.

"Almost no one."

They sat for a moment with only the sound of dripping water and the tapping of leaves that moved in the artificially controlled breeze. The wisps of her dream haunted Drummer's mind like the afterimage of a strobe.

"One ship," she said. "They sent *one* ship. They didn't hold ground at Medina. They didn't fortify. They didn't build supply lines or prepare a flotilla. They sent one big-ass ship through by itself. Like a boast."

"I'm as surprised as you are," Avasarala said. "Though I feel like I shouldn't be. I actually read history. It's like reading prophecy, you know."

"All we have to do is deal with this one ship, and everyone will see that Duarte's not invulnerable. He's not infallible."

"That's true."

Drummer laced her fingers, leaned forward with her elbows on her knees.

"All we need is one lucky break," she said. "One thing to go our way,

and your logistical mastermind who would never overreach loses his capital ship in front of everyone who's watching. And I think everyone is watching."

"They are," Avasarala agreed with a sigh. "But ..."

"But what?"

Avasarala's smile was thin, hard, and bitter. Her eyes flashed with an intelligence poisoned by despair. "But it isn't hubris until he's failed."

Chapter Twenty-Four: Singh

Singh's monitor lay flattened on the desk in front of him. Above it floated a 3-D projection of Natalia and Elsa smiling back at him. It wasn't a great shot of them. He'd photographed it himself, and it was a little out of focus. But it was taken at the park where they'd had the monster's second birthday party, and his daughter grinned out at him with cheeks covered in vanilla frosting, and Nat positively glowed with happiness. It was one of his favorite memories.

Once the Typhoon arrives, I will be able to move to the important work. It also almost certainly means this posting at Medina will be made permanent soon. I want you to start thinking about relocation. Your work was always about helping the colony worlds establish stable food sources, and this is the hub of everything. They'll welcome your research here with open arms. And I promise, the water issues should be fixed by the time you and Monster would arrive. Nothing but clean water for you guys, or I'll tear the station down one bolt at a time and rebuild it myself. I also—

"Governor," a voice said from the monitor, startling him.

"Yes?"

"Major Overstreet is here, he says it's an emergency."

"All right," Singh replied, then shut down the image and saved his letter to finish later. "Send him in."

Overstreet was almost the physical opposite of his predecessor. Where Colonel Tanaka was tall almost to the point of rangy, he was short, thick-necked and broad, with fists the size of boxing gloves. His shaved head was the palest skin Singh had ever seen, and his eyes were an icy blue. Among Martians, that combination was fairly exotic.

"Governor," Overstreet said with a sharp salute.

"At ease, Major."

Overstreet shifted his feet apart and linked his hands behind his back. Where Tanaka had been all arrogant insouciance, Overstreet was every bit

the disciplined Marine. Singh liked working with him.

“Governor, I’m sorry to report another terrorist incident. Unfortunately, this one also included a loss of life.”

Loss of life only meant one thing in this context: a Laconian fatality.

“Thank you for keeping it off the wire, Major,” Singh said. Following the assassination attempt, he’d ordered that any further terrorist activity be kept as quiet as possible. They needed the population of Medina to feel like they were safe under Laconian control. “Who and where?”

“Second Lieutenant Imari, an environmental support specialist. She was tracking an air-filtration error and wound up in a crawl space on the outermost level of the drum. A small improvised explosive device was remotely detonated. Lieutenant Imari was killed instantly. One of her techs received minor injuries and is being treated on the *Storm*.”

“Imari,” Singh said, concentrating until he could place a face with the name. He’d only met her a few times. Pleasant and professional in all their interactions. And her skills with environmental systems would be sorely missed in Medina’s refit. “Do we know who?”

“I had bomb techs on the site within minutes of the blast,” Overstreet said. “The chemicals used to manufacture the explosive were traced to a storage compartment on drum level two. I pulled the logs. The majority of those with access have been identified. Marines have already begun rounding them up.”

“That is excellent work, Major,” Singh said. Overstreet brought him a solution with every problem he reported. It made his own terrible misstep with Tanaka feel like a blessing in disguise.

“The rules of engagement allow us to treat active terror cells as enemy combatants,” Overstreet said. “But unless one of these idiots has a hideaway gun, I’m betting we’ll bring them all in alive. So, it’s your call, sir.”

Overstreet looked like he had no opinion one way or the other. If Singh ordered him to go to the holding pens and shoot every single person in the head, it would just be the next thing he did that day. No lectures on how he’d fought Belter cells back in the day, no subtle digs at his lack of experience.

“We’re going to need to start holding trials at some point,” Singh said. “This seems as good a time as any. We’ll need some time to form a civilian justice system for Medina and the colonies. Something less encumbered

than the local habits.”

“Yes, sir,” Overstreet agreed with a nod. “I’ll have my people put together all the evidence we’ve collected and forward it to the advocate’s office. We’re not police, but whatever we can do to expedite the trial process, we’re happy to help out.”

Singh leaned back and pointed at one of the visitor chairs next to his desk. “You’re doing outstanding work, Major. You’ve slid into Colonel Tanaka’s role without a hiccup. I appreciate it.”

Overstreet stretched out, relaxing but without the aggressive informality of his predecessor. “Tanaka was a great mentor. She left me detailed files on ... the duties of this post. Give her credit for the smooth transition.”

“Mmhmm,” Singh said. “Anyway, I’ve sent in my recommendation that you be promoted to the rank of lieutenant colonel, as befits the posting you now hold. We’re just waiting on word from Laconia to make it official. You’ve certainly got the years in, and your record is exemplary. I don’t foresee any difficulty.”

“I appreciate that, sir,” Overstreet started, then looked down at the monitor on his wrist. “That’s fast work. The detachment reports that all seven of the suspects have already been rounded up and taken to a holding area, awaiting your orders. Shall I have them taken to the open-air cells, pending trial? Let everyone on the station see them locked up? Sends a message.”

“Yes, I—” Singh began, then rethought it. “No. If that holding area is private, keep them there. I’d like to speak to them.”

“Of course,” Overstreet said. Into his monitor he said, “Triphammer oscar mike. We need transport and escort to level four, compartment one three one one echo bravo. Ready to move in five.”

Singh had studied detailed files on the history of Medina, from its aspirational beginnings with an Earther religious faction to its outright theft by the OPA and conversion into the universe’s worst battleship before finally settling in as the hub of human expansion through the gate network.

Singh found the idea of a generation ship fascinating, in a morbid sort of way. He could understand taking great risks for your children. He was

doing that right now. Trying to help build the well-regulated human empire that his monster Elsa and her future children could thrive in. There was a romance in the idea of setting out on a journey you'd never see the end of so that your grandchildren might live a better life. But all the numbers he'd seen on how a hundred-year voyage like that would play out were fairly horrifying. It was, to say the least, a very high cost and very low probability of success. Singh assumed there was a faith element to the risk that he was just missing. In his opinion, faith was generally for people who were bad at math.

Compartment 1311EB turned out to be a former storage compartment for animal feed. Another of the many structures built into Medina Station back when it had been the *Nauvoo* and had interstellar colonization as its purpose. Medina was filled with these relics of the station's original purpose even as they had been converted over to new uses. Seven Belters sat on the floor, hands zip-tied behind their backs. Four men, two women, and one person who could be any gender or none and who looked far too young to already have decided on a career in terrorism.

Singh entered the room flanked by two Marines in power armor and Overstreet taking up a position by the door. The four Marine guards in the room snapped him a salute, then went back to watching their little gang of prisoners. With fifteen bodies in the room, it felt very cramped.

"I am the station governor, Captain Santiago Singh," he said, taking time to stare each of the seven prisoners in the eye as he spoke. The youngest stared back with a fierce rage that looked entirely out of place on their beautiful, genderless face.

"No one fuckin' cares," one of the men spat back at him. The Marine closest to him casually kicked him in the ribs. Singh waved him back.

"I need you all to listen to me very carefully," he said. "A bomb was made using chemicals from the warehouse you seven work in. That bomb killed a Laconian naval officer, and injured another."

"Good," said one of the women.

"Not good," Singh replied, without changing his tone. "Because the penalty for this criminal act will be death by firing squad. At this point, there is no reason to believe all seven of you aren't in collusion. You are either working with terrorist cells, or you are in fact the cell that planted that bomb."

"Better to die a free Belter than live a slave," the young one said. They

had a singer's voice, high and clear.

He started to wonder if it might have been better to have seven different conversations with the prisoners rather than one with all of them. They were performing for each other now. Each of them signaling their loyalty to the others. It made it more difficult to know what their actual flexibility might be.

"We can debate the benefits of centralized government later," Singh replied. "For now, I have one offer to make, and only one. When I leave this room, I am going to ask that an appointed judge review the evidence from the bombing and find all seven of you guilty of terrorist acts. You will then be taken to a public place, and shot."

"Not much of a fuckin' offer," the first man said, rubbing his bruised ribs.

"While the judge reviews that evidence, I am going to have you held in private cells. The first one of you to cooperate in our investigation of terrorist activity on this station, lives."

"Turn traitor to save our own necks," the young one said. "You don't know Belters at all."

"I know humans. I know that staying alive and keeping one's family safe is not a trivial reward for valued service to the empire. It is the only choice you have left in your lives. Make the right one."

Before they could shout any defiance at him, Singh turned and left. As they walked away, he said to Overstreet, "Put them in separate cells, far enough apart that they can't hear each other. Then make sure there's a guard outside every door. Just in case someone decides to take me up on my offer."

"Copy that," Overstreet replied. There was a hint of skepticism in his tone.

Singh stopped. Overstreet turned to face him, a puzzled look on his broad face.

"Something troubling you, Major?"

"I didn't intend any disrespect, sir."

"Our mandate from High Consul Duarte is to win over the population of this station, as a first step in winning over the population of the colony worlds. We do that by entangling our interests. By teaching them that what they think of as 'informing' is actually just good citizenship. This is just a first step in building what will hopefully be a network of cooperators to

help us.”

“Understood,” Overstreet said. “Marines make terrible police, sir. We’re not trained for this sort of job. If we could build up a security force made up of local cooperators and Marine elements, it would help a lot.”

“Good. Make that part of your mandate going forward. You have full authority to offer amnesty to people you think might be useful.”

“I’ll pass it down the ranks,” Overstreet said. He began gently pushing Singh back up the corridor toward their little convoy of carts.

“The other thing,” Singh said. “I think it would be appropriate to make a complete audit of the security protocols. Call it a supplemental security review.”

“I can do that if you’d like, sir,” Overstreet said. “Can I ask what function the review would fill?”

He meant *Am I being called on the carpet?* This was also the fallout of letting Tanaka go. There would be a period where his people trusted him less. Suspected that he would blame them for failures in the system. Punish them for things that weren’t their fault.

“We need—” he began, then caught himself. “I need to look over the complete system of security we have. Things are going to change simply because we are here, with these people, and not in a classroom at the academy. I don’t know how yet, but I think it’s inevitable. I am trusting you to tell me not only what we do but why. And whether you think it should be altered.”

“Comprehensive, then,” Overstreet said, but he sounded more pleased by the implied trust than put out by the extra work. “I’ll see to it. Back to the office, sir?”

Singh almost said yes, but a thought stopped him.

“No,” Singh said. “No, take me to Carrie Fisk’s office. And notify her we’re coming.”

On the ride to the Association of Worlds’ offices, Singh thought back to his letter home. The idea that being able to hold the ring space meant they’d won the war was optimistic. Or simplistic, at least. Laconia could absolutely control access to the worlds through the gates, but every single world could decide this didn’t mean *they* were conquered. And even if they placed a Laconian governor on every world, and a Laconian naval ship in orbit and Marines patrolling the streets, every individual might decide they personally had not been conquered. Establishing the empire was an endless

series of microscopic magnifications into greater and greater granularity, and every grain was a potential renegade. Medina was just a microcosm of the problem they'd be running into everywhere. Political opposition considered as fractal geometry.

He had been sent as a governor, and the more he saw, the more he came to understand what that assignment actually was. Not just a bureaucrat to oversee the smooth functioning of the station and the traffic it controlled. He was creating the template for making every other human world into a new Laconia. Seven Belters had decided that killing a single low-level officer was worth risking all their own lives. That wasn't a rational position. An enemy that bad at basic math might do anything. The colony worlds might decide that throwing a few hundred people with rifles onto a transport ship and trying a suicide attack on Medina made sense. He only needed to hold the station for a few more weeks until the *Typhoon* arrived and rendered any such foolhardy attack plan irrelevant. Carrie Fisk could help to carry the message that would dissuade any such error before it could happen.

The office complex occupied by the Association of Worlds sat inside the drum section of Medina, surrounded by farmland. It consisted of three blocky structures of prefab fiberglass sheets, painted a gentle off-white, and sporting the interlocking honeycomb banner of their organization. Singh suspected the design was intended to symbolize the interconnected rings of the gate network. For the headquarters of an organization whose goal was the centralized governance of thirteen hundred worlds, it looked cheap, shabby, and hastily erected. Nothing like the massive stone structures Laconia built to house the future government of mankind.

Carrie Fisk occupied an office on the third floor of the largest of the three buildings. She had a lot of empty space, a single desk with four chairs, and flaking light-green paint on her fiberglass walls. He wondered what their first meeting would have been like if he'd come to her office instead of bringing her to his. Seeing all of this, he might have recommended against working with her at all.

"Madam President," Singh said as he entered, taking her hand in his own. "I'm glad you could take the time to meet with me on such short notice. This is Major Overstreet, the Marine commander on Medina."

Carrie shook his hand, and gave Overstreet a baffled nod. "Of course, Governor, anytime," she said, and gestured to her chairs. Singh sat,

Overstreet did not. “Tea?”

Singh declined with a wave of his hand. “I’m afraid I don’t have much time to socialize. I have an important message for you to send to the association worlds, and to the local governments on those worlds that have at this point elected not to officially join you.”

“Okay,” Carrie said. She really was a frightened little mouse of a person, Singh decided. He found himself wondering how such a person could become the leader of anything, much less the nascent government for a galaxy-spanning republic. But she’d had a following before he came, so maybe there was more to her than he saw. Failing that, she could be made into the sort of person he needed.

“It occurs to me that while the *Heart of the Tempest* is engaged with the fleets in the Sol system, and additional Laconian forces have not yet arrived to secure Medina Station, some ill-informed members of your association or other prospective members who haven’t officially joined you yet might view this as a moment of weakness for our occupation.”

“I don’t—” Carrie started.

“But it’s important that everyone understand that such a view is both inaccurate, and dangerous,” Singh continued over the top of her. “You will send a message, as the president of the new Laconian Congress of Worlds, to every planet in the network.”

“The what?”

“The change of name will more closely join your group with the empire. It’s important that they recognize you as a legitimate and trusted representative of Laconia. You will tell them that any hostile action taken through one of the ring gates, be that a ship full of soldiers or an angrily thrown rock, will result in the total sterilization of the inhabited planet on the other side of that ring.”

Carrie went still for a moment. “Jesus Christ. Are you *serious*?”

“It’s come to my attention that many of the social organizations of the old human power structures show a shocking inability to do risk analysis. They may foolishly attempt a doomed assault, thinking all they’re risking is their own lives. Reason doesn’t work with this kind of person. I need you to make them understand, on an *emotional* level, the price for such an attack. I will kill every single person on their planet. I assume even former OPA radicals have family members they care about, and whose lives they are less willing to risk on a romantic notion of a hero’s death.”

Overstreet's bright-blue eyes were on him. Singh felt the man evaluating him.

"I can't be part of something like that," Carrie said.

"You can," Singh insisted. "Because I'm making that the rule of engagement for our occupation here, whether you warn people or not. I think it's best if everyone understands that before they do anything with such a terrible price. Don't you agree?"

Singh stood up, and Overstreet opened the door for him. Carrie Fisk stared at him from behind her desk. Singh didn't see the fear he expected on her face. More a sort of simpleminded confusion.

"Please get the announcement out before the end of the day," he said. "I leave the wording to you, as long as all the details I laid out are included. Good day, Madam President."

He left the room with Fisk still reeling from the shock. Overstreet fell easily into stride behind him.

"Permission, sir?" Overstreet said, his tone reserved and formal. Distant, almost.

Singh felt a moment's chagrin. He should have called Overstreet by his given name. He'd forgotten that, and it seemed late to change their habits now. He needed to be more careful about that. "Proceed, Major."

"Are we going to order those attacks?"

"Only if we have to," Singh said.

Overstreet didn't reply at once, and when he did, his tone was flat. "Understood," he said.

Chapter Twenty-Five: Holden

Holden shifted in his bunk. If he lay on his side with one arm raised and his head resting on it like a pillow, he could block that ear, then put a hand over the ear that was pointed up at the bunk above him. It was almost enough to block out Alex's snoring. But it also made his shoulder ache after a while, and his hand fell asleep before he did. He could track down a set of earplugs, but that meant getting out of bed. Half-awake as he was, that seemed like a lot of trouble. Anyway, no one else in the bunks seemed to be bothered. He also knew—half knew—that if he woke up enough to fix the problem, he'd be too awake to sleep again. Admitting that age and anxiety had turned him into a light sleeper felt vaguely shameful in a way that probably wouldn't have stood the scrutiny of a fully conscious mind. Years of living with his crew had built habits and norms that they were violating in these new circumstances, and it was weird.

Clarissa made an uncomfortable sound halfway between a whine and a growl. In the bunk across from him, Naomi shifted. By the dim orange glow of the safety light, he could just make out the curve of her shoulder, the shape of her hair spilling out over her pillow.

Which meant his eyes were open.

Which meant he was awake.

He tried closing his eyes again, willing himself back down to sleep, but Alex coughed above him, and Holden shifted his arm. The pins and needles started in his fingers. The last wisps of dream and oblivion thinned and vanished out of his brain. As quietly as he could, he rolled to the edge of the bunk, let himself down to the deck, and slipped out the door, leaving the others to get the rest he couldn't.

The web of unmonitored space that Saba and his people had carved out of the flesh of the station was tighter than living on any ship Holden had crewed. Keeping the power low enough to avoid detection meant thick air and rationed water. The murmur of voices speaking in musical Belter

Creole was as present as the hum of the air recyclers. Holden made his way to the head—an emergency cut-in to the processing system with a seat about the right size for a five-year-old. He had to wait for the woman already there to finish. By the time he stepped back into the access hall, he was fully awake, hungry, and a little grumpy.

Naomi slouched down the hall toward him. Her undershirt was stained with sleep sweat and use. The top of her half-undone jumpsuit gathered at her hips like humanity's worst bustle. Her hair and face still had the shape of her pillow to them.

She was beautiful. She made everything better than it would have been without her.

"You're up," she said.

"I am."

"Me too."

"Sucks, right?"

"Oh yeah," she said, then gestured toward the head. He shifted out of her way.

"Want to risk breakfast out in the world?" she asked as she passed him.

Holden let the question sit in his chest while he was alone in the corridor. When they were in the secret passageways of the underground, they were safe in that they were unmonitored. The Laconian-controlled station was dangerous, but it was also open. Fresh air, better food, and as far as Holden knew, they still weren't on security's shit list.

And there were things they could learn by being there that they'd never get if they only ever stayed where it was safe.

When Naomi emerged, he took her arm like they were stepping out to a formal affair, and together they walked to one of the security hatches, and from there into Medina Station. The transition points were the most dangerous. Moving from the unmonitored spaces into public without seeming to pop into existence out of nowhere meant timing their passage in places that were only intermittently watched, or else getting secondary entrances into showers, locker rooms, and toilets, where privacy gave them cover.

When they reached the open sections of the station, it was moving from one kind of oppressive environment into another. The halls were bright and open, the air fresh and if anything a little cool. Screens and monitors showed the locally produced Laconia-approved news: propaganda about the

stability and security of the station mixed with whatever pop-culture feeds from outside the slow zone made it past their censors. Holden and Naomi walked through it like refugees at a shopping complex, trying not to blink into the too-bright lights.

They weren't alone. The crews of all the other ships and the citizens of the station all had the same dazed look to them, though at different intensities. People were still scrounging for quarters or camping on the inner face of the dome. The docks were still locked down, and that showed no sign of changing. Any normal hand terminals were still blocked from sending messages off Medina or gathering data that wasn't locally stored and vetted. There was a way that being in Saba's underground felt like being buried alive. And there was a way that being outside of it made being buried alive seem like not such a bad thing. It was cozy, anyway.

They stopped at a café two levels below the open air of the drum's interior. He got a bulb of genuinely third-rate coffee—overroasted to hide the shitty beans in the taste of the char, and a chalky cream substitute—and Naomi got tea and a corn muffin that they could split. They sat at a little table as far away from the public passage as they could get and still have a good view of the foot traffic passing by. Two men, smoking pipes that looked like they'd been made of decking ceramic. A group of schoolchildren in matching gray-green uniforms. A busker with a marionette trying to amuse passersby with her antics. It could have been any station in human space. And as they watched, they talked about things that weren't dangerous if anyone were to overhear.

In the public corridor, a security team walked past. Two figures in the blue power armor bristling with weapons. The carts and foot traffic moved around the pair like a stream flowing around rocks. Their presence wasn't intimidating people as much now, or at least not in the same ways. On a screen across the corridor, Carrie Fisk of the newly renamed Laconian Congress of Worlds was being interviewed by a pretty young man with a military haircut. Holden wondered what she was saying, but the café had their system set to a light, friendly saidi list that shifted from one melody to the next without ever pausing in between. The same music, Holden guessed, that they'd played before Laconia came knocking.

It was all becoming normal. He could see it in the way the clerk served up the terrible, terrible coffee. He could hear it in the conversations at the nearby tables. It showed on the screens and in the gaits of the people

walking by. Panic and alarm were exhausting. He was exhausted by them, and Medina was exhausted too. It was already shifting into its new routine. Checkpoints, yes. Armed security, yes. All the theater of dominance and control and nothing to undercut that narrative.

Just to look at it, you wouldn't guess there'd been a bombing.

Saba hadn't known it was coming either, and they'd only heard about it through him. A small explosion, but the unofficial reports said at least one Laconian had been killed. The official reports, apparently, were that it hadn't happened at all. That was a change. The assassination attempt had been used to justify the crackdown. Now the crackdown was just another day, and highlighting the attacks on the structures of power wasn't useful. Nothing had to be justified anymore. Governor Singh in his offices was trying to project a sense of normalcy and inevitability. And as far as Holden could tell, it was working.

"Kind of quiet," he said, meaning *They think they're winning*.

Naomi tugged her hair down over her eyes. "Right?" she said. It meant *I think they're winning too*.

Back in the underground, Holden found Saba sitting at a dumb terminal. Even in full light, Saba's hair and skin were nearly the same color. In the backslash from the screen, he almost seemed like a cartoon of himself. He nodded at Holden and shifted a few centimeters on his bench to give him room. Holden sat.

"Checking on the *Storm* dump?" Holden asked, nodding toward the screen. The log entries spooled up. The information they were intercepting from the Laconians was encrypted on a variety of levels, and using more than one schema.

"Dui," Saba said. "Everything between the station and the *Storm* is coming in, but until we get access to the server that decrypts it, it's just noise. Plenty more irons in that fire, though. Medina comms got more compromised than we thought. Turns out Golden Bough bought a tech eighteen months ago, got a backdoor into the system we never noticed."

"Really?" Holden said. "How'd you find it now?"

"Coyo told us," Saba said, flashing a grin. "Patriotism is weird shit."

Holden chuckled. "Whatever works, I guess."

They sat for a moment in near silence. Saba scratched his arm and pointedly didn't look at Holden when he spoke again. "Big coya seems like she's got a little stone in her throat. Any trouble with your crew?"

"Nope," Holden said. And then, "I mean, yeah, but nothing that'll cause a problem."

"Don't guess you want to say what? Make me feel better to know."

Holden leaned forward. The logs spooled past, storage filling with traffic that might be everything to them. Or nothing. Bobbie wasn't something he'd talked about before. He wasn't sure he wanted to start now, but he was living in Saba's rooms, eating the man's food, coordinating on his operations.

"It's not exactly my crew," Holden said. "I had some trouble with the union before all this happened."

Saba's grin came again. "You're forgetting whose man I am, que no? Drummer spends a little time talking about you behind your back, and that means to me."

"Right, so ... I was in the process of retiring when all this came down. Dropping off the Freehold guy was my last mission. Was going to be. The crew is really Bobbie's, only then history got in the way, and now I'm sort of back in charge and sort of not. It's awkward."

"Savvy," Saba said. "I'm there too."

"Something wrong between you and Bobbie?"

"No, no, no. Only that Medina's my home port, but the *Malaclypse* is my home. This came down, and I got put at the front because of my spouse and her job and the union. Plenty enough around here don't like that. Do their own thing because it's their own."

"Like the bombing," Holden said.

"Like that trap, yeah. Like the trying for the governor. Like a bunch of assholes I stopped who were looking to steal Laconian uniforms, beat up some of our own so they could start shit between, yeah?"

"That doesn't seem productive," Holden said.

"Not about productive," Saba said. "About reaching for what can get done. Plenty of old OPA on Medina. When the Alliance turned into the union, it didn't erase all the old factions. There's Ochoa OPA and there's Johnson OPA even when there's no Ochoa or Johnson. Voltaire Collective set that bomb like they'd just been waiting for the chance, and maybe they

were. Oldsters going at it like they were young again. Young ones trying to live up to the stories of the bad old days. Like pumping oxygen into a fire.”

Holden shook his head. “If we’re going to manage anything, we have to —”

The dumb terminal chirped, and one of the entries came up highlighted. Saba pulled the interface pad closer and scrolled back to the flagged entry. He cross-checked and opened the file. All the things a real system would have done for him automatically, if they could risk using one.

Saba clicked his tongue against his teeth.

“What’ve we got?” Holden asked.

“Traffic control plan update,” Saba said. “Got something slated as coming in through Laconia gate, but not right away.”

“How far out?”

“Forty-two days?” Saba said. He moved through the data as carefully as he could, checking the distribution stamps and time codes. It didn’t take him long to find the name and transit specs for the ship. The *Typhoon*. And from the mass and energy profile, it was huge. On a hunch, Holden had Saba match it with Laconia’s first transit. The two were the same. The *Typhoon* was another *Tempest*. Holden felt a tightness under his rib cage wondering how many more like it there were.

Saba cursed under his breath. A man’s voice came from behind them, somewhere in the warren of hidden corridors. A woman answered. The bulkheads, the exposed conduits and industrial decking, the thick air and the darkness. All of it was just the same as it had been when Holden sat down, except that now it seemed fragile.

Another warship from Laconia with more soldiers. The beginning of the permanent occupation. Not just the beginning of the end. The end.

Saba cracked his knuckles and smiled ruefully at Holden. “Well,” he said. “Leaves me wishing I could tell Drummer and the union. Kind of thing she’d want to know.”

“Yeah,” Holden said, trying to gather his wits. There was more than a little of him jumping around behind his own eyes like a panicked monkey, but this wasn’t the time for it. “All right. We still have some time. Whatever we decide to do, our obstacles are the *Gathering Storm* outside the station and something like two hundred, maybe two hundred and fifty power-armor-wearing Marines inside it.”

“And loose-cannon OPA factions firing off without warning,” Saba said.

“When they hear about this, they’ll get worse. Complicate everything if they won’t coordinate.”

“So that too,” Holden agreed. His brain felt like it was stuffed with cotton ticking. He wanted to get all his people onto the *Rocinante* and run away. If there was anyplace that the Laconians wouldn’t just follow them and shoot them down. If there was anyplace in thirteen hundred systems that would be safe anymore. For them, or for anyone.

“Okay,” he said. “All right. Whatever goals we decide on, we have to take those three things into account. And we have to do it in the next forty-two days.”

“Because after that,” Saba said, “no more us, yeah?”

OceanofPDF.com

Chapter Twenty-Six: Bobbie

Bobbie, Alex, and Clarissa ate lunch together in a tiny compartment with ELECTRICAL SUPPLIES stenciled on the door in four languages. It had a few unlabeled crates in it that they could use as tables and benches, so they'd taken to calling it the Diner. The meal was the heavily spiced and deep-fried balls of bean paste that Belters called red kibble. On the side they had a few bits of dried fruit, and a thin seafood soup that tasted like the flavor came from having a fish swim through the broth.

"You know what I miss most about the *Roci* about now?" Alex said, poking at his kibble, which rolled around his plate. "My ship knows how to make Martian food. I'm so sick of this Belter shit."

He was exaggerating his Mariner Valley drawl the way he always did when he spoke of the ship. Bobbie laughed at him, then noisily drank off the last of her broth.

"It's good for you, boy," she said, mocking his drawl.

"It keeps body and soul attached, and that's about the best I can say for it."

Clarissa smiled at their banter, but said nothing. She was picking up a single ball of kibble at a time, then carefully chewing it. It was like watching a bird eat in slow motion.

"I wonder if the Laconians still eat Martian food," Bobbie said. "We could ask."

Alex tossed his plate down onto their crate-table in disgust. "You know, I think what chaps my ass more than anything else about this shit? The guys who came out of the gate and started wreckin' our shit and takin' over aren't some damn aliens. It's fucking Martians. I bet there're people on that Laconian ship I served with back in the day. Dollars to donuts, the top brass in the Marine detachment here are people you know, at least by name."

Bobbie nodded, chewing the last of her kibble. "That's actually an interesting idea. I mean, could that be useful? Find some people in their

command structure that know us? Is that an in?”

“I ain’t talkin’ about how it’s useful, Bob,” Alex said, nearly knocking over Clarissa’s water glass with his angry hand gestures. “I’m talkin’ about the idea that people just like us, Martian patriots, picked up and ran off with this Duarte guy, and took about a third of the fleet with them.”

“You ever wonder if it could have been us?” Bobbie asked.

Alex lowered his brows at her. “You lost your mind?”

“No, really, think about it,” Bobbie said. “We were both out of the service when Duarte started making his move. You’d been retired for a decade at that point. I’d been out of the Corps for a couple years. But if we’d still been active duty, could we have fallen for his pitch? I mean, a lot of good people did.”

“A third of the stars of heaven,” Clarissa said, as if she were agreeing.

“Uh,” Alex replied, cocking his head in confusion.

“A third of the what now, honey?” Bobbie said.

“From the Bible. Revelation. When the devil fell from grace, he took a third of the angels with him. It’s described as the great dragon pulling a third of the stars of heaven down with its tail.”

“Huh,” Alex said like he had no idea what she was talking about.

“Why’d that pop into your head?” Bobbie asked.

“Whatever story Duarte was selling was compelling enough to get a big chunk of the Martian military to buy in. The devil’s story was freedom from the oppression of God’s rules, and it was good enough to win a lot of angels to his side. Whatever Duarte’s pitch was, it’s a good one. Don’t be so sure you wouldn’t have bought it.”

“Oh, I’m pretty fucking sure,” Alex replied with a snort.

Bobbie had to admit she wasn’t. A galaxy-spanning human civilization run the way the Martians, at their best, ran things. Organized, focused on a single overarching goal. Efficient, well planned, not wasting anything. She could see why that appealed to a lot of people when Mars was watching its dream of terraforming die. Duarte could step in and sell them a new dream that used all the same skills and attitudes that the old one had, but was even grander in scope. Bobbie recognized that there was a version of her that was fighting on the Laconian side right now, and it made her itchy.

Alex had started to gather up the plates and cups from their meal when Amos walked into the room. “Hey, Babs. Cap wants to see us about that thing.”

“Which thing?”

“The making-sure-no-more-bombs-go-off-we-don’t-know-about thing.”

“Oh, that thing. Be there in five,” she replied, and he shrugged and walked off without another word.

“Still kinda chafes, don’t it?” Alex said, his voice gentle.

“What? Hearing him go back to calling Holden ‘Cap’?” Bobbie said, ready to shrug it off. But something caught in her throat. “Yeah. I gotta admit it does. I might have a word with him on that.”

“Be gentle,” Clarissa said. “He’s fragile right now.”

Bobbie had no idea what the word *fragile* meant when applied to Amos. She wasn’t sure she wanted to learn.

Saba leaned against one wall in the larger storage space that they’d been using as their insurgent-cell meeting room. Someone had finally pushed all the crates and boxes up against the walls to serve as seating, and some enterprising thief on the crew had even managed to steal a few benches from one of the parks. About twenty members of their group were scattered around the space, including Holden, Naomi, and Amos.

On the wall screen behind Saba was a diagram of Medina, and a picture of a severe-looking woman with black hair and a lot of facial piercings. She stared at the camera with angry eyes, giving the picture a mug-shot feel. The name Katria Mendez floated beneath her photo.

“The Voltaire Collective,” Saba said, pointing at her. “Bomb throwers from ancient days.”

“Fighters,” someone in the room replied, making the word a term of respect.

“Sa bien,” Saba replied. “Now with Laconia? They go back to the old script.”

“Apart from the fact that their strategy doesn’t work anymore and it’s fucking our shit up, they seem like people we want in our team,” Holden said. “We should recruit them. Coordinate with them. Killing them or feeding them to the Laconians should be our last option.” He sounded a little scattered. Distracted. She wondered what was up with him. He knew something or suspected something that was eating up all his spare cycles.

Bobbie had seen it before.

Saba nodded with one fist. "If we can, we should." He pointed to a sublevel on the Medina map marked Water Reclamation. "Holed up here, them. I say we send our envoys to make them an offer of alliance."

Holden turned on his bench to look back at Bobbie. She gave him a tiny nod. He stood up to take a spot next to Saba and said, "I think we should send Bobbie to speak for us. She can pass along our respects, tell them we need to join up, and if they get belligerent ... well, she can handle that too."

"Agreed," Saba said. "How many you want with you?"

"Let's keep this small," Bobbie replied. "Just me and Amos for now. This should feel like natural allies reaching out. Not a war party."

"Sabe bien," Saba said. "But this ends with they don't plant more bombs unless we say so. Our house gets in order now. One way or."

"Yeah," Bobbie agreed. "One way or, that's where this ends."

The shortest path to Water Reclamation included a short jaunt through the inner drum. Bobbie didn't mind. Hiding out with her resistance-fighter buddies included an awful lot of sleeping and eating in tiny metal rooms. Getting out into the habitat space with open air and a dirt floor and the full-spectrum light on her face was a welcome change.

Even the ubiquitous Laconians didn't ruin the mood. For the most part, their conquerors were easy to get along with. They acted like people who'd lived on Medina for years: eating in the restaurants, browsing the shops, making use of the entertainment districts. If you gave them a nod, they nodded back like old neighbors. Even the Marine patrols moving past in their exotic blue power armor looked alert, but not particularly threatening.

Bobbie had seen the other version of them during the assassination attempt on the governor, so she knew they could go from friendly and professional to full rock-and-roll at the flip of a switch. Easy to get along with or not, the Laconians were a military occupation. You forgot that at your peril.

"How are you doing?" Bobbie asked as they walked through a particularly lush section of park. The lovingly tended path curved through grass, patches of flowers, and even past the occasional tree. Insects buzzed

about, still the best-designed pollinating system there was. Technology did a lot of things well, but evolution had it beat when it came to environmental systems.

“My feet hurt,” Amos said. “Kind of all the time now. Glad these Belters keep the rotation at a third of a g.”

“It’s quicker to list the shit that doesn’t hurt, these days,” Bobbie said. “But that’s not really what I meant.”

“Yeah?” Amos said. His tone didn’t change at all, but Bobbie had flown with him for a couple decades now. She could hear the tension that had crept in.

“Claire thinks maybe you’re having a tough time right now.”

“Does she.” Amos’ voice had gone so flat, it might have been a badly written computer simulation of him. He was checking out of the conversation. Pushing it farther wouldn’t help.

“Anyway,” Bobbie said, keeping it light. “You need anything, I’m up for whatever.”

“Yeah, I know, Babs,” Amos said. “But these Voltaire guys are no joke. We better get our game faces on.”

The Voltaire Collective occupied a dusty crawl space beneath and between half a dozen gigantic stainless-steel tanks. It was a good spot. Unless the piping sprang a leak, there was literally no reason for anyone to come down to the space. The Collective definitely still had some skill sets left over from their OPA resistance-fighter days. Katria Mendez in person was all hard angles and sharp edges, and her dark eyes burned with a constant low-level fury.

“You’re actually coming here to lecture us on how to run an occupied insurgency,” she said. Her voice was gentle and warm. The voice of a favorite teacher, or beloved aunt. A voice that asked if you wanted some lemonade with your cookies. It also had the precise diction and studied lack of accent that Bobbie associated with advanced education. Her Belter accent could have been measured in parts per billion.

“Not at all,” Bobbie started.

“Because,” Katria continued, “the Collective has been a militant branch

of the OPA, resisting inner-planets control, for nearly a century.”

“I understand,” Bobbie said.

“Do you? Because it seems like you just showed up here and told us that we’re not allowed to run any resistance operations without your consent. Or did I misunderstand what you were telling me?”

Bobbie heard shuffling feet behind her, and turned around to see five members of Katria’s cell had taken up a loose semicircle at her back. None of them held weapons in their hands, but they all wore the loose-fitting jumpsuits of the Medina Station maintenance workers. Lots of big pockets that could be hiding anything from a hammer to a compact machine pistol. Amos, standing to her left, caught her eye without losing his smile. He took a half step back, managing to make it look casual.

“Look,” Bobbie said to Katria, stepping up and looking down at her from their half-meter height difference. “We didn’t come here to start a fight. As far as I’m concerned, we’re all on the same team. But if you force it to go the other way, we’re prepared for that, too. And I promise you it will not go the way you want.”

“Honestly, I’m just not sure why Saba didn’t come himself,” Katria said, not backing down at all. “Or why he thought sending a Martian and an Earther to tell Belters how to fight was the right message.”

Bobbie didn’t know any answer to that other than *because we’re the most intimidating soldiers he’s got, now that walking through Medina with firearms has become a really bad idea*. She winged it instead.

“Because maybe that *is* the message. Because this isn’t about Belters and inners and last century’s bullshit. Because now it’s about all of *us* versus the assholes who popped out of their gate thirty years into our game and decided they get to flip the table over.”

Katria nodded and smiled. “That’s actually not a terrible answer.”

“Then let’s ease down,” Bobbie said, taking a half step back again to give Katria her space. “Let’s find a place to sit and have a drink and chat about how all of us can work together to fuck these Laconian assholes up. Yeah?”

“You keep giving me that eye, boy, and I’m gonna pull it out of your head and hand it back to you,” Amos said, his tone so mellow and conversational that it took Bobbie a moment to recognize the threat was real. He was looking back at the semicircle of OPA toughs at their back, directing his empty gaze at them. But Bobbie saw a vein at his temple

throbbing like he was at risk of a stroke. The muscles moved under his skin like taut cable dragging over his jawbone.

“Amos,” she said, and then she wasn’t talking anymore because she was in a fight.

Amos threw himself at someone behind her, and she heard grunts and the meaty thud of fists hitting flesh, but she couldn’t turn around to see what was happening because a long knife had appeared in Katria’s hand and the woman was dancing toward her. *Fighters*, one of Saba’s people had said. And like the Laconians, the Voltaire Collective folks also seemed ready to go from zero to a hundred at the flip of a switch.

Bobbie didn’t have time to dance with Katria, nor did she want to get herself stitched up from a knife fight, so she straight-kicked the woman in the diaphragm and dropped her to the deck with an explosive *oof*. She took a second to kick the knife away, then started to turn when something heavy slammed into her cheek.

Through the explosion of stars in her vision, she saw Amos grappling with two men at the same time, choking one with his left arm while he slammed the second man into one of the water tanks over and over again with his right. A third man had climbed onto his back and was attempting a sleeper hold, but couldn’t get his forearm under Amos’ chin to lock it up. The other two OPA goons were flanking Bobbie, and one of them was holding the crowbar he’d just cracked her cheekbone with. In the sort of slow-motion clarity Bobbie always experienced during a fight, she saw skin and blood on the crowbar’s edge.

Oh, she thought, that’s why my face feels wet.

Crowbar was pulling back for another swing, while his partner tried to get behind her. Bobbie decided Crowbar was the more serious threat and lunged at him to get inside the arc of his swing. His arm went around her, and she felt the bar slam into her shoulder blade, which made her right arm go pins-and-needles numb. She threw a throat punch at him with it, and even though she couldn’t feel it, her arm did what she told it to. Crowbar dropped his weapon and clutched his throat with both hands, gagging.

His partner kicked her in the back, twice. One kick hit her kidney, and the other her butt. While the kidney shot might have her pissing blood for a few days, it was the kick to the ass that almost put her on the ground. It felt like someone set off a small bomb in her lower back, and she felt a sharp crack that almost certainly meant he’d snapped her tailbone.

She turned to see him unleashing another kick, and managed to mostly sidestep it, letting it bounce off her hip and forcing him to stumble forward into her. She grabbed hold of his left arm and rotated through the hips to throw him face-first into a pressure-monitoring console a few feet away. He hit it with a thud and a crunch, and started to sag.

Then, just because he'd kicked her in the ass, she snapped his left arm before she let him drop.

Five minutes later, Katria and her five friends sat or lay on the floor, hands tied behind their backs. Amos had an eye that was already starting to swell shut, and four scrapes down his cheek that looked like he'd been clawed by a big cat. Bobbie had carefully avoided looking at her own face in anything reflective. But based on the volume of blood in her shirt, the wound on her face had to be pretty grotesque. *There goes my not-needing-stitches plan.* The pain in her backside also meant she wasn't going to enjoy sitting for the next couple of months. That thought made her want to kick the unconscious man with the broken arm again. Or maybe Amos.

"Katria," Bobbie said, leaning down over the Voltaire Collective cell leader. "Is it okay if I call you Katria?"

If Katria had any objections, she kept them to herself.

"Great. So, look. This could have gone better. We kicked your ass and you're pissed now, I get that. If you want to be part of the revolution, great, we'd love to have you. But you run all your ops through Saba's group. That's nonnegotiable. Anything else, and we're killing you and hiding your bodies in the fertilizer-recycling system."

Bobbie grabbed the front of Katria's shirt and picked her back up to her feet, then kept lifting until they were eye to eye.

"Do we understand each other?"

To her surprise, Katria laughed. There was a brightness in her eyes that looked like fever. "We do indeed," the woman said. It could have been a sparring partner's salute or the threat of retribution. Bobbie really wished she could tell the difference.

Chapter Twenty-Seven: Drummer

It was easy to forget sometimes that the void cities hadn't always been there. During the starving years, they'd been something like a dream. A promised land without the land. Homes for the Belt that could move through the gates to whatever system they chose. There had been a magic to them then. A sense of the unprecedented.

Time had worn that shine away. Drummer had spent more time in the last decade on People's Home and Independence and Guardian than on ships or asteroid stations. They'd become so familiar that they'd bled back in her memory until it felt as though the corridors and chambers had been present since her childhood, even if she hadn't been on them. Like a city often mentioned, but not visited until adulthood. She had to remind herself that war was always this way. Had always been. Cities had been falling under siege since the time there were cities. Mortars had fallen on schools. Soldiers had stormed hospitals. Bombs had set churches and parks and children on fire. Homes had been lost before now.

The tactical display floating over the table was off by orders of magnitude. If it had been to scale, Independence would have been too small to make out with a microscope. As it was, the identifying code was larger than the ship icon. A smear of light smaller than a crumb of bread that meant a city where two hundred thousand people, more or less, lived and worked, raised children, divorced and married, drank and danced and died. And then burning sunward from it, the evacuation ships—even smaller—that carried as many people as would fit away from the theater of battle. She looked at them and saw all the other times children had been carried away from a disaster that was approaching and that could not be stopped: London, Beijing, Denver. History, she reminded herself, was peppered with moments like this one. It only felt different because this was her city, a void city, and this had never happened before.

She had repurposed the central traffic-control station of People's Home

for this. Military analysts and engineers, some of them union, most of them EMC, sat at the desks where civilians usually were. Feeds to the war rooms on Earth and Mars showed similar rooms with similar people, but considerably less light delay. The screens that usually listed incoming and outgoing ships with approach vectors and expected times were devoted to the incoming signals from all the active telescopes in the Belt. Images of the major observation stations showed when fresh data streams were coming in, where they were coming from, when People's Home was transmitting. Images from Independence and the dozen EMC ships included flags for time delay—an hour and twenty-three minutes—and a composite of the enemy claimed the central display. Pale as a bone, burning lazily toward the point where the battle would begin. Maybe had begun. Maybe had started and ended in the hour and twenty-three minutes it took light to bring the message to them.

“The, ah, the resolution will get better as we get the signal bounce,” the EMC technician said. She was younger than Drummer had been when she started working on Tycho, with red hair pulled back in a bun and a wide, doughy face. On Earth and Mars, other technicians were probably having the same conversations with the prime minister and secretary-general. “It’s a trade-off, of course, between immediacy of the direct signals and the better information density of delaying a few minutes to get the extra feeds.”

“I just need to know what’s happening,” Drummer said.

Avasarala, who still hadn’t made the passage back to Earth, and Vaughn were at the edge of the room. Admiral Hu was at one of the central control consoles, sitting forward like an overeager schoolgirl at the first lecture of term. She’d come as a forward observer, the military leader of the EMC nearest to the battle without being in it. A bulb of what smelled like green tea rested on a side table Vaughn had brought out so that the admiral wouldn’t risk spilling on the control board. Drummer walked to her less because she wanted to talk than because she had to move.

“Madam President,” Hu said, nodding to her.

“Admiral.”

“Odd being on the same side of a shooting war, isn’t it? I never thought the day would come.”

That says more about you than the reality of things, Drummer thought. The EMC wasn’t its own side any more than Ilus or Surabhi or Neue Ausland were. The dreams of empire faded slowly. It didn’t matter.

“We’ve got a comm report, Madam President.”

“Play it,” Drummer snapped. The main screen shifted. The Laconian admiral appeared. His voice was patient and calm, but there was a glitter in his eye. An excitement. It made Drummer’s gut ache to see.

“This is Admiral Trejo of the *Heart of the Tempest* to the approaching warships. I ask that you stand down. Any interference with our ship will be met in kind. Don’t make this worse than it has to be.”

“Fuck you,” Drummer said to the screen, but not softly enough that Admiral Hu didn’t chuckle. It was only ten seconds before the answer came. God, that’s how close the distant war ships all were to each other. Light-seconds.

Emily Santos-Baca, the ranking board member who lived on Independence. Her hair was pulled back in a tight braid in preparation for null g. Or it had been an hour and twenty-three minutes ago.

“Admiral Trejo,” Santos-Baca said, “on behalf of the Transport Union and the Earth-Mars Coalition, I am informing you that your presence in Sol system is a violation of territorial space and is being considered an act of war. Your ship will brake immediately and return to Laconia until appropriate contracts and diplomatic resolutions are in place.”

They were reports from two competing realities. Drummer wished that Santos-Baca’s sounded more plausible. The icons that marked the EMC ships were like dots drawn on the skin of a balloon, the *Tempest* moving in like a pin. It couldn’t be long. Couldn’t have been.

“The dispersal,” Hu said. “You see that? The way they’re spread out? That’s based on the Medina data your people sent. The spread of that magnetic whatever-the-hell-it-was. We placed the ships so that no matter which one it aims at, it won’t be able to get two. Good, eh?”

“Excellent,” Drummer said. Her throat was dry, but the smell of the tea was a little nauseating.

“The range of it can’t be good either,” Hu said. “The science wonks say the power curve would be logarithmic. Remaining at range should force the bastards to use any other weapons systems they have. Assuming that the magnetic cannon even works in normal space. Because there’s at least one idea that it’s using special properties that only exist in the ring space. And if that’s the case—”

“Gloria.” The old woman’s voice was like a knife. “You’re doing it again.”

Admiral Hu glanced back at Avasarala. Drummer hadn't heard her approach, but there she was. Her smile was indulgent and warm and, Drummer had to assume, utterly false.

"Gloria is a good warrior, but she gets chatty when she's nervous."

"We're seeing fire," one of the analysts said. His voice was as calm and businesslike as a surgeon announcing a bleeder.

The display shifted. The EMC ships and *Independence* were still there, but backgrounded as the focus changed to swarms of missiles pouring out toward the *Tempest*. Each one burned hard enough that a human body would have been pulped by the g forces, and they barely seemed to move. The distances they traveled were vast. Even at their speed, three million clicks was a long time. Verbal threats that took seconds at lightspeed followed by punches that would take minutes or hours. Even without the warheads, the kinetic force of the torpedoes would be massive. If they hit. The swarm crept forward, pixel by imperceptible pixel. Drummer waved a steward over and ordered a bulb of ice water and a bowl of hummus with bread. She had to try to eat.

The hummus was half gone and the tea tepid before the first of the missiles started winking out of existence.

"What are we seeing, please?" Hu said.

"It appears to be long-range PDCs," one of the analysts said. "We're waiting for the bounce feed so we can get higher resolution."

Another twenty minutes, and a much sharper image of the *Tempest* appeared with the timestamp to show it was just after the fleet's launch. All along the sides of the ship, tiny dark eruptions like the spots on a shark.

"The PDCs' housings appear to be covered by the hull. Telemetry from the *Michael Souther* is that the remaining missiles were redirected toward those structures." Were. An hour and twenty minutes ago.

"They're not using their magnet beam," Hu said. "That's good. If it was cheap for them to fire it, they could use it to knock down missiles. If it's expensive to use, we may be able to exhaust it."

Drummer thought that sounded like wishful thinking, but she didn't say so. She tried to take comfort in Hu's optimism. The data feeds shifted, more information coming in. The images of the *Tempest* sharpened. The PDCs came into clearer focus, but it didn't help Drummer understand them. The openings in the side of the ship looked like little mouths opening and closing. Like the whole side of the ship was singing. There was no

mechanism she could see. She shuddered. The cloud of torpedoes was thinning. None of them would reach the body of the enemy ship.

A bloom of glowing gas erupted from the *Tempest*'s side, flinched, and then dissipated.

"Rail guns," an analyst said.

The chatter of voices went into a higher gear. Tracking the rail-gun round, examining the spectrum of the plasma that had accompanied it, identifying the particular torpedo that it turned to dust.

"Are their PDCs running low already?" Hu said, to herself as much as anyone.

"It was a warning," Avasarala answered. "They're showing us that they have teeth and giving us the chance to back away."

"Maybe we should," Drummer said.

No one replied. The markers for the EMC ships shifted like a school of fish moving together, and Independence with them. Their own volley of rail guns, the slugs raining down from all directions. The *Tempest* had no way to stop them. All it could do was dodge. Drummer counted the minutes, watching the *Tempest* pull back and corkscrew out of the paths of danger. Mostly.

"I'm seeing contact."

"Two impacts on the starboard. Waiting for confirmation from Pallas and Luna, but I think we did them some damage."

The knot in Drummer's gut eased a little. If they could hurt it, they could kill it. It was just a question of scale and tactics.

"The hull appears to be self-repairing."

"Matches the Medina battle," Hu said.

"Show me," Drummer barked, and the image on her screen shifted again. It was a fresh image, still fuzzy. The bone-pale skin of the *Tempest* rippled as a round struck it, and then again with a second strike. Waves passed through the ship like the surface of water. Nasty black-and-red welts glowed where the rail-gun rounds had hit, but the plating—or whatever it was—folded over the wound, closing it, then folded again, and the damage was gone as if it had never been there.

Another volley of rail-gun fire from the EMC ships, but as the *Tempest* flinched back again and spun away again, it erupted in a cloud of plasma, and then emerged from it. Drummer didn't understand until Hu spoke.

"Holy shit. How many rail guns does that bastard have?"

Now the *Tempest* shifted and swirled, leaving a trail of glowing gas behind it like an afterimage. It was beautiful in its way, a warrior's dance—power and intention and technique that were almost balletic. And then the EMC ships began to die.

"The *Ontario* is hit. Reporting reactor breach and dumping core. We are seeing impacts on the *Severin*, the *Talwar*, and the *Odachi*, but no system confirmation yet. Rounds arrived thirty seconds earlier than the model anticipated."

"Fuckers," Avasarala said. "That's why they took out the missile. Throw a changeup and let us think it was their fastball."

"Whatever they're using for predictive algorithms, it's really good," Hu said, awe in her voice. "That's almost a third of our attack group down. And if ... Oh."

For a moment, Drummer didn't understand what she was seeing. Independence, the second void city to launch, the home to hundreds of thousands, seemed to bloom like a flower. Long petals of carbon lace and titanium peeled back, turning as they did. Something terrible and bright happened in the center of the city, but Drummer couldn't guess what it was. What she knew, what mattered, was that between one breath and the next, Independence was dead.

"We're counting eight simultaneous impacts on the void city," an analyst said from somewhere farther away than the control room. "They seem to have been placed to exploit resonance. We're seeing some structural breakdown."

Emily Santos-Baca was on Independence, Drummer thought, and she'd been dead already for over an hour. It didn't matter how much adrenaline was pumping through Drummer's veins, how tightly she gripped her bulb of old tea. She could shout the retreat order if she wanted to, but anyone in a position to hear her was dead already, or would be by the time her words could reach them.

The PDCs along the *Tempest*'s side fluttered again. Another group of EMC torpedoes died, faster this time because it was a smaller attack. The *Tempest* seemed to pause, floating in the distant nothingness as if inviting the EMC ships to take their best shots. Taunting them.

An hour and twenty-three minutes before, the EMC ships shifted, lit their Epstein drives as hard as they'd go, and turned to whatever vector got them away from the theater of battle as quickly as they could. The *Tempest*

didn't react. No new blooms from their rail guns. No more torpedoes. Drummer didn't believe for a second that the enemy's supplies had been exhausted. Trejo wasn't killing the other ships because he didn't need or want to. That was all.

Drummer put her tea on the little side table next to Hu's, turned, and walked out. She was aware in a vague, distant way of Vaughn behind her, calling her name. It wasn't something that mattered enough to attend to.

The decking of People's Home felt fragile under her feet, as if her footsteps might be enough to break them and spin her and everyone else in the city flying out into the vacuum. She passed her security detail, distantly aware of the men and women assigned to make sure she was safe in any circumstances scrambling to follow her.

It didn't matter. Because they didn't matter. Not when a whole city could die in a heartbeat.

She was in the lobby of the union's executive offices, sitting in an uncomfortable couch with her eyes locked on nothing in particular when Avasarala found her. The old woman steered her wheelchair across from Drummer like they were in someone's private quarters or a back porch back on Earth. There was no one else in the lobby. That was Vaughn's doing, more likely than not. In her imagination, the decking beneath her and Avasarala bucked and split open. What had Santos-Baca thought when it happened? Had she had time to think about it at all? She was trying to understand that she would never see the younger woman again, but the thought wouldn't take. She dreaded what came after it did.

"I'm sorry," Avasarala said.

Drummer shook her head.

"It won't help you," the old woman said, "but they all knew the risks going in. The chances that we would turn the *Tempest* back the first time we tried? Always thin."

"We should have waited," Drummer said. "We should have pulled them all back. Gathered everyone together and had every goddamn ship we have attack that fucking monstrosity at the same time. Wipe it out."

Her voice broke. She was crying, but it didn't feel like it was her doing it. Avasarala handed her a cloth. "You're mistaken, Camina. The cost was higher than we wanted. Higher than we'd thought. But we did what we came here to do."

"Die? Badly?"

“Learn,” Avasarala said. “How quickly the deck healed itself? That’s something we needed to know. But the places where a rail-gun round hit their PDCs, the weapons system there didn’t grow right back into place? We needed those too, and we didn’t even know to look for them. Maybe the ship can’t fix more complex mechanisms. We have a map of the armaments now. Where the PDCs are. Where the rail guns are. Where the torpedoes launch from. Next time, you can target those specifically. Degrade its attacking power, push it in ways we couldn’t this time because we just didn’t know.”

“All right,” Drummer said.

“They didn’t die for nothing,” Avasarala said.

“Everyone dies for nothing,” Drummer said.

They were quiet for a moment. Drummer coughed, blew her nose into the cloth, and then leaned forward, her elbows on her knees. Since the moment she’d taken the oath of office, there had been moments—not many, but enough to recognize—that she’d been certain that her place at the head of the union was all a terrible mistake. Saba promised her that everyone felt like that, like an impostor, sometimes. It was part of being human. His words had seemed comforting before. In her mind, Independence died again. She had the sick feeling that it would die a thousand more times before she got to sleep. More when she dreamed it.

“Did you do this to me?” she asked.

Avasarala frowned, papery forehead folding itself like a slept-on sheet.

“Did you manipulate me into sacrificing my people so that you’d get the data you wanted?” Drummer said. “Was this you?”

“This was history fucking us both,” Avasarala said. “Live as long as I have? See the changes that I’ve seen? You’ll learn something terrible about this.”

“Tell me.”

“No point. Until you see it yourself, you won’t understand.”

“Hey, you know what? Fuck you.”

Avasarala laughed hard enough that her wheelchair thought something was wrong and bucked forward a few centimeters before she could stop it. “Fair enough, Camina. Fair enough. Here then. See if you can follow me. Last long enough, and you’ll see that they’re all our people.”

“Independence and the *Ontario*,” Drummer spat. “Union and EMC, all one big happy family standing against the blowtorch together. Wonderful.”

“I told you that you wouldn’t understand,” Avasarala said, her voice cold and cutting. “The fuckers on the *Tempest*? I’m telling you they’re us too.”

Chapter Twenty-Eight: Holden

The artificially pretty man who acted as the news anchor for what everyone was calling the Laconian-state newsfeed sat in somber reflection, not quite looking directly into the camera. On a screen behind him, the first battle between the *Tempest* and the combined forces of the Sol system played out. It was all from the *Tempest*'s perspective, of course. Lots of telescopic zooms and torpedo-guidance camera footage. In one, a Martian frigate, one of the *Rocinante*'s next-generation cousins, died in a fireball as a rail gun shot cut through it from nose to tail. In another, a torpedo camera POV hurtled through space and into the flank of a UNN destroyer and ended in a flash of static.

One by one, the ships of the Sol fleet died. From the footage, it wasn't possible to tell if the *Tempest* was even damaged. And each time a ship died, a quiet gasp went through the air around Holden as he sat and watched the first act of the end of the world in a cramped metal room surrounded by the members of his little resistance group.

The screen behind the pretty man went blank. He turned his sober face directly into the camera and said, "To address Medina Station regarding what you've just seen, we are honored to bring you a statement from station governor, Captain Santiago Singh."

The camera pulled back to reveal Governor Singh sitting at the news desk next to pretty boy. Singh lacked his counterpart's carefully sculpted androgynous beauty, but he shared his look of quiet reflection.

"Greetings, Laconian citizens and residents of Medina Station. I come here in a moment of tragedy for us all. I will not gloat, or brag about Laconian military superiority. I have no wish to glory in the destruction you've just witnessed. Instead, I honor the brave warriors of the Sol system, who died believing they were defending their homes. There is no greater sacrifice a warrior can make, and I have nothing but respect for these courageous people. I ask that you honor them as well, as we have a moment

of silence.”

Singh lowered his head and closed his eyes. Pretty boy did the same.

“Motherfucker,” someone behind Holden said. Next to him, Bobbie loudly cracked her knuckles and frowned so hard Holden worried she might pull out the fresh stitches holding her cheek together.

On the screen, Singh lifted his head, then a moment later opened his eyes. “Laconians, and I speak to everyone on Medina when I say that, as I consider all of you my fellow citizens and peers. Laconians, the stated goal of your military is always the defense and protection of life. When the Sol system fleet ceased their attack and began a retreat, the *Heart of the Tempest* immediately ceased firing on them. And no element of the Laconian military—ship, soldier, or station—will ever fire except in response to threat to life or property.”

“Or in retribution against a whole fucking system you don’t like,” someone said from behind Holden. “Hypocritical dawusa.”

Singh leaned forward, his dark eyes imploring all who watched him. “I urge everyone with family or friends in the Sol system to contact them, to urge their political representatives to meet with Admiral Trejo and discuss the terms of their entry into the Laconian Empire without further military action and loss of life. Those who died were heroes all, but Laconia wants live citizens, not dead heroes. It is our duty—yours and mine—to do everything we can to achieve peace and safety for all of us. To this end, I am temporarily lifting the communication blackout back to the Sol system for those with family there. Please use this freedom to help your loved ones make the right decision. Thank you for your attention, and good day to all.”

Bobbie rolled her shoulders like a boxer stepping into the ring. To her right, Naomi was staring at the screen through half-lidded eyes, like she was solving a complex math problem. Holden was about to speak when Saba stood up and walked to the front of the room. The thirty or so people of the Medina Station insurgency became respectfully quiet. Holden held his breath.

“No reprisals,” Saba said, and Holden released his held breath in a rush. That was *not* what he’d expected to hear. “You savvy, coyos? Not one *fucking* thing. Yeah, pissed off, you. Got reason. Got all the reason. Want to cut a throat, make somebody pay.”

“God damn right,” a skinny man everyone called Nutter said, standing up and toying with the knife on his belt. “Maybe a lot of throats.”

“You do,” Saba said to him, “and yours is next, and I’m doing the cutting. Mushroom food, you. Every Laconian throat you cut is ten of ours you’re bleeding out. We stay angry, but we stay *smart*, sabe? Stay with your missions, stay with your plans.”

A ripple of grudging assent moved through the room. People started getting up to leave. The mutters of conversation had an edge to them, but Holden didn’t hear anyone actively planning a murder, so he’d call it a win.

Holden caught Bobbie’s eye and then stood up to grab Saba’s arm before he could leave. “Let’s talk.”

Fifteen minutes later Saba, Bobbie, and Naomi were sipping tea out of waxy cups in the Diner. Holden tried casually leaning against the wall for a minute, then gave up and paced around the room to give his restless energy someplace to go.

“The problem we’ve got right now is we’re all rats in a cage,” he said. “And we’re spending a lot of time and energy figuring out how big the cage is and where the doors are and how we might open one. But we haven’t got a single clue what we’d do if we actually got out.”

“We don’t start with just getting out?” Naomi asked.

“There was a time when I’d have said that was enough,” Holden agreed. “But that was when I was still thinking of this as a war. When escaping to join up with our side of the fight might matter.”

“This isn’t a war now,” Bobbie said, her voice low and dangerous.

“No?” Saba asked.

“No,” Holden said. “The war’s over. Sol might not know it yet, and a lot of people will die so that they can feel like they gave it a shot, but it’s over.”

“So what, then,” Saba asked. “Good Laconians, us?”

“No,” Holden replied. “At least not yet. But it does change the nature of what we’re doing here. We’re not looking to get the *Roci* free and join the fight. This is a jailbreak.”

Naomi made a clicking noise with her tongue, her eyes distant, then said, “All the same problems. The Marines, the Laconian destroyer, Medina’s scopes. But you’re saying if we can solve those, we just get as many people and ships free as we can and make a run for it. Scatter.”

Saba nodded one fist, then gave her the two-fingered OPA salute. Holden felt a little twinge of unease about that, but this wasn’t the time to talk it through.

“It gives us a goal,” Holden said. “Maybe we can keep everyone pulling

the same direction if they understand what the end game is.”

Saba tilted his head. There was no surprise in his expression. He’d been thinking along the same lines, so maybe he’d come to the same conclusions. “The decryption safe room.”

“I don’t like losing it,” Holden said, looking more at Bobbie now than Saba. “We’re still getting in a lot of data from the sniffer, and I know once we move forward with the plan, we lose that. We won’t get it back. But until we can decrypt what we do have, we can’t use it. And the *Typhoon*? It’s due in thirty-three days.”

“Thirty-two,” Naomi said.

“I don’t want to die with one still in the chamber,” Bobbie said. “I’m good with the timing.”

“Bien,” Saba said. “I’m in.”

“Great,” Holden replied. “Get word to every cell leader and ship captain you trust. We need to have everyone ready when the time comes.”

“This is gonna be some strange bedfellows,” Saba said as he left.

“Find some lunch?” Holden said to Naomi.

“Give me half an hour,” she replied. “I want to get a computer crunching the tactical data that video gave us. But after that, meet out front?”

“OK,” Holden said, wondering how to waste half an hour in the cramped space of their little hideout.

“Hey, Holden,” Bobbie said as Naomi left the room. “Can I hang on to you for a second?”

Holden shrugged and sat on a crate. Bobbie sat flexing her hands and staring at the floor so long that Holden started to wonder if he’d misheard her. He braced himself. He didn’t know where this conversation was going to go, but he had a suspicion it was about her and him and the captaincy of the *Rocinante*, and he didn’t know what to say about any of that. So it came as kind of a relief that he was wrong.

“Amos is going to be a problem,” she finally said. “I had the Voltaire people talked off the ledge when he started that fight. He wanted to crack some heads, and he made it happen. That’s fine for shore leave when he wants to blow off some steam, but it won’t fly when we’re under the radar like this.”

“Huh. Okay. I’d wondered about that.”

“It’s a problem I don’t know how to fix,” Bobbie said.

“Me neither,” Holden said. “But give it a couple days.”

“Not sure we have them,” Bobbie said.

“Why not?”

Bobbie pointed behind her back, meaning not what was physically behind her but backward in time. “You just gave us all a goal,” she said. “Something to bring us all together.”

“I did,” Holden said. “And I’m thinking from the way you’re looking at me right now that there’s some aspect of that I’ve maybe overlooked?”

“Some of us are Katria Mendez and her mad bombers.”

Holden felt a coolness down his spine. “Yeah. That could be interesting,” he said.

“Right?”

He found Amos in a narrow side hall, a welding torch in his hand. The big man’s arms showed little pocks of red where sparks had landed, but Amos hadn’t done so much as find a long-sleeved work shirt.

“Hey,” Holden said. “How’s it going?”

“Doing all right,” Amos said, gesturing at the conduits that textured the wall. “Saba’s folks said we should reroute the power. Makes it a little harder for the cops to track down where they’re losing it from if it keeps moving.”

“Yeah?”

“Decent plan in theory,” Amos said. “In practice, kind of an ass-pain, but whatever.”

“I can see that,” Holden said, then paused.

The truth was, in spite of decades flying the same ship, Holden still had very little idea what made Amos tick. He liked food, booze, meaningless sex, jokes. He seemed to like palling around with Alex, but when their pilot had decided to try being married again, Bobbie had been his best man. Amos treated every word out of Naomi’s mouth as if it were gospel, but the truth was all of them did these days.

Amos found the conduit he was looking for, lit up the torch, and opened a six-centimeter length of it, exposing the plastic-sheathed wire inside it without so much as melting the insulation. It was a good trick. Amos killed the torch.

“So,” Holden said again. “How’s it going?”

Amos paused. Turned to look at Holden.

“Ah,” the big mechanic said. “Sorry there, Cap. Were we having a conversation and I didn’t notice?”

“Kind of, yes,” Holden said.

“Babs ratted me out.” Amos’ voice was as calm as the surface of still water. Holden was pretty certain something big was swimming underneath it.

“Look,” he said, “we didn’t get where we are by me prying into things you didn’t want pried into. I don’t want to change that now. But yes, Bobbie’s worried about you. I am too. We’re going into some pretty dangerous times here, and if there’s anything that you need to get off your chest, now is a better time than later.”

Amos shrugged. “Nah, I get it. I got a little happy when we went on that last run. Opened up sooner than Babs would have liked. I’ll rein in some if it makes her feel better.”

“I don’t want to make an issue of it,” Holden said.

“It ain’t an issue, then,” Amos said, turning back to the conduit. He took a thick pair of pliers from his pocket, clamped them over the power cable, and started wrestling it out like he was getting crab meat out of a shell. It looked really dangerous. “I’ll play nice. Cross my heart.”

“Okay, then,” Holden said. “Great. Glad we had this talk.”

“Anytime,” Amos said.

Holden hesitated, turned, and walked away. Bobbie was right. He didn’t know what was going on in Amos’ mind, but something definitely was. He was hard-pressed to think what the good version of that looked like. And if Amos was finally coming off the rails, he had no idea what would cause it or how to fix it.

Chapter Twenty-Nine: Bobbie

The representatives from the Voltaire Collective entered the meeting space like they were anticipating an attack. She would have felt the same if the positions were reversed. Three in the front with unencumbered hands, three in the back looking around like tourists coming to a casino for the first time in case something interesting or threatening would come from behind, and in the center, Katria Mendez. Her face was the expressionless calm of a player at a poker table. The kind that always left with more chips than she came with. Just seeing her made Bobbie's cheek throb a little. Psychosomatic pain, but pain all the same. She registered the sensation but didn't let it bother her.

Saba stepped forward, Holden at his side, and greeted them, waved them forward with smiles and Belter salutes. He let them check him for weapons first as a kind of social courtesy, and Holden did the same. The old phrase from back in the day came to Bobbie's mind: There's OPA and there's *OPA*. Same now as it had been then. It was always a little eerie to see how comfortably the men and women of the Transport Union fell back into being criminals. And how well she and the crew of the *Roci* fit in with them when they did.

Amos stretched his shoulders and neck.

"I know," Bobbie said. "I don't like it either."

"Don't recognize the one with the nose," Amos said, pointing with his chin toward Katria's bodyguard. "The other ones, I'm pretty sure we danced with."

Bobbie considered their faces. The one Amos was talking about stood in the rear, just behind Katria. He had olive skin, close-cropped hair, and a long nose that had been broken a couple times and not set right. A white scar marked one nostril like someone had slit it for him once. She was pretty sure she'd have remembered him if she'd run into him before. The others, she wasn't as certain. Katria, obviously, and two of her guards at the

front all seemed familiar enough.

“Maybe we’ll get to know him,” Bobbie said.

“Now you’re just flirting with me, Babs. Promising a good dustup when everyone else is here for talking.”

“Yeah, well,” Bobbie said. “A girl can dream.”

The banter felt almost normal, but she wasn’t easy with it. Not yet. She was plenty willing to play along for the moment, though. Katria caught her eye and nodded. Bobbie smiled, her cheek pulling at its new scab, and nodded back. It could have been respect between equals or the handshake at the start of a fight. Bobbie figured they’d all find out which soon enough.

The meeting space was new to her. A long, thin room that had been part of the water-recycling system recently enough that it still smelled a little bit of wet plant and sewage. Twice as long as it was wide, there was enough space for the *Roci* crew, Saba, and a half dozen of his most trusted crew. The ones who already knew the plan. It wasn’t a pleasant spot, but the cartography of the underground’s borders were shifting now, more and more often. The Laconian surveys had been finding the holes in the system surveillance, denying them free access to the corridors and units they’d made their own. They’d been spending more and more of their time in the monitored public spaces. Part of that had been reconnaissance for her plan. Part of that had been that there were fewer and fewer spaces left on Medina where they could speak freely.

All through the station, there were soldiers and crowd-suppression drones. It didn’t bother her, passing the people with haunted eyes, walking like the deck might be too fragile to support their mass. She understood them. The others, the ones who were laughing and talking and listening to music loud enough that she could hear the bass, bothered her more. They were acting like the open-air prisons and the power-armored Marines, the communications control and shift curfews were normal. And because of that, they were.

It wouldn’t be long before the Laconians started shipping through the slow zone again. Maybe she and the others would be allowed back on the *Roci* when that happened, but Bobbie found it hard to believe there wouldn’t be monitors placed in there too. It could take Naomi and Clarissa days or weeks to purge them all and make their ship fully their own again.

And by then, it would be too late anyway. Every day, every hour, brought the *Typhoon*’s arrival closer. And once it had cleared the Laconia

gate, staying ahead of the occupying forces became orders of magnitude more difficult. Which was the optimist's way of saying "impossible." Bobbie felt the pressure of time slipping away like she was watching a door close, with her on the wrong side of it. If it hadn't been for the time pressure, she wouldn't have gone along with Saba's suggestion to reach out to the Voltaire Collective. Or at least not so soon after she and Amos had kicked their asses.

The only good thing was that Katria and her people were just as screwed as Saba and Bobbie and Holden, and by the same things.

"So," Katria said once the requisite sniffing was done, "I'm surprised at having so civil a meeting. I have to think you need something from me you can't manage by yourselves?"

Saba smiled, but waved his hand twice sharply. "Too many ears, sa sa? Come sit with me and mine, have a drink, and we'll talk about what we talk about."

Katria crossed her arms.

"It's not you," Holden said. "It's just that the fewer people know about this, the less chance someone gets picked up by security. You can't tell anyone what you don't know, right?"

Katria Mendez looked from Saba to Holden and then, pointedly over to where the *Roci* crew were sitting. Not just Bobbie and Amos, but Naomi and Alex and Clarissa besides. "So none of mine but all of theirs?"

"All of theirs already know," Saba said. "They're who wants to talk with you most."

"They have strange ways of showing it," Katria said.

"This is my house," Saba said. "My salt on it, yeah? Parley. And if it's nothing, it's nothing. But we're under the same thumb, you and me. Not asking you to love anyone. Just listen to."

For a moment, Katria hesitated. Her scowl bit into her cheeks like it was going for bone. Bobbie had a brief flash of certainty that the whole Voltaire Collective was about to turn and walk away without even hearing her pitch, and she was more than a little relieved at the idea.

"Esá es bullshit," the one with the nose spat. "They're just trying to get you on your own, que? Make you not be here, that's all. It's all of us or none!"

"It's my call, Jordao," Katria snapped. "Not yours."

The one with the nose—Jordao, apparently—stepped back, sulking.

Holden was smiling like a salesman, as if his radiant goodwill could warm up every other interaction in the room. It left him looking more than a little ridiculous, but damned if Katria didn't consider him for a long moment and chuckle.

"If I refuse, then we all took a long walk for nothing," she said. Holden beamed. Bobbie wasn't sure how he did it. The way he could disarm a situation with his almost palpable guilelessness astonished her every time.

"Thank you," Holden said. "I really appreciate this."

Saba lifted a hand and two of his people ghosted in from the corridor and led Katria's guard away. Standing by herself, she didn't seem any less imposing. The door to the corridor slid shut, and the bolt clicked. It was as near to privacy as anyone on Medina could have.

"So," Katria said. "What's on your mind?"

Bobbie took a long breath, let it out between her teeth. The idea had been hers from the start, and she'd been mulling it over for days. She hadn't slept as much as she'd wanted. Even when she hadn't been reviewing it and looking for holes in the plan, she'd felt too jagged and amped up to sleep. Part of that had been thinking about how to make the approach she was going for now.

"There's a single point of contact between the Laconian destroyer and Medina," Bobbie said. "And we have a bug on it."

Katria's eyes went a degree wider. She glanced over to Saba, who nodded. It was true. Katria didn't sit, but her weight settled into her hips a little. Bobbie had her attention. That was good.

"The encryption isn't breakable," she said. "Not from the outside. The Martian codes it's based on are solid. We might be able to crack them if we had between now and about a decade on, but we're down to a countable number of days. So we've got enough intelligence gathered to fill libraries that we can't read. But I think we can fix that."

She plucked her hand terminal out of her pocket, slaved it to Saba's local system, and pulled up the schematic of Medina that she'd been using. The cavernous center of the drum, command and control on one end, engineering and the docks and the massive but quiescent engines on the other. The elevator shafts that ran between them outside the surface of the drum. And also the ships in the dock, including—highlighted in red—the *Gathering Storm*.

"The longer goal is that we find a way to disable the *Storm*, here, shut

down Medina's sensor arrays, and distract or isolate the security forces on Medina long enough to let all these ships get off station and out through the rings before their reinforcements from Laconia get here. The short-term goal"—she zoomed in on a small red mark inside Medina proper, near the docks—"is this."

"And that is?" Katria asked.

"It used to be backup power storage," Bobbie said. "But since our guests from Laconia got here, it's been repurposed."

"The thing is," Alex said, breaking in, "these Laconian fellas? They were all Martians to start, or their leadership were anyway. And they were serving just a little after me and Bobbie here did our tours."

He looked from Bobbie to Katria to Saba and then back. Bobbie nodded him on. Alex licked his lips.

"One of the things we trained on was how to go about securing an enemy station," he said, which wasn't true. It was something Bobbie had trained to do, not him. Storm and control the homes and communities of Belters. If there was going to be a sore spot, this would be it. It was why Alex was saying it instead of the woman who'd cleaned Katria's clock and left her zip-tied to her friends. It seemed less likely to rub on Katria wrong that way. "You heard of air-gap encryption strong rooms?"

Katria's eyes were brighter. She hadn't, but she didn't want to admit that. Alex licked his lips again, shot a look from Bobbie to Katria and back to Bobbie, then went on. "One thing that we did was maintain physical separation between whatever ship was taking control and the local systems. Lay in a pipe to one of our own boxes on the station, and send any commands we wanted for the base there. Communications, control protocols, everything. It gets unencrypted there, and set onto onetime physical media to walk over to the local system. No live connections at all."

"Bullshit," Katria said.

"It's standard," Bobbie said. "And it's part of why no one was ever able to hack back into a Martian ship from a controlled station. And since the Laconians are basing their protocols on Martian ones, this is where that machine is."

"But the lag time—" Katria shook her head. "That's impressive."

"The room is crewed by two people, always. The door is physically locked. Not connected to the security grid, no electronic interface. Old-school bolt and key, and no keyhole on the outside. Can't be hacked into

remotely, can't be circumvented easily," Bobbie said. "And a full complement of guards at shift change."

Katria took control of the model, zooming farther in on the encryption vault. Her face was thoughtful, which was better than Bobbie had hoped. It made her nervous to talk about this.

"I see," Katria said. "You can't get in without making a lot of noise and calling in the cavalry. Is that why you need me? To blow the door?"

"No," Bobbie said. "We have a way in. We need your help to cover it up once we're done."

Katria traced a slow circle with her fingers. *Go on.*

Clarissa picked up the thread. "The room is still connected to the environmental system. But if we put a team here"—she pulled the model back to a larger frame and touched the power junctions near engineering—"we can shut down the fans and open the carbon dioxide scrubbers and recycling systems."

"Choke them out?" Katria asked.

Alex shook his head. "Make a path to pilot some little drones in. Half a dozen of 'em with point-blasting charges. Take down the two guards, then use the rest to pop the lock." He made a little boom sound with his lips and opened two fists in the physical cartoon of an explosion.

Bobbie pointed toward Naomi. "She has a snapshot cloning deck. I'll have a crowbar and a hammer. We get in, make a full-state copy of the encryption box, and get out to the hardened-radiation shelter"—Bobbie moved the model—"here. And then *you* come in."

"If los security coyos know we stole their codes," Saba said, leaning against the wall, "they change things up, yeah? Not just new crypt but new procedures. Everything we've got turns into a whole lot less. So they can't know what we do, even after it's done."

Holden pulled the model out to show where the *Storm* was docked against the side of the station. "We need to give them a different story. The *Storm's* parked here. And the primary liquid-oxygen storage tanks are ... right here. If that blows out, it will look like we're trying to blow up the *Storm*, but Tycho built this place well. Lots of redundancy and fail-safes. There's an explosion-relief route that'll vent the pressure blast out along this pathway here ... which takes out the communications vault. And, y'know, a bunch of other stuff."

"You want to blow our air out as cover?" Katria said. "I think you may

owe us an apology. We're usually the ones who are called extreme."

"Not our air," Saba said. "Theirs as soon as they came here. We're breathing on their grace, us. Plus, those tanks are docked-ship refills. Not for the habitat."

"And there will be plenty in the secondary and tertiary tanks," Holden said. "Remember, lots of redundancy, lots of fail-safes. And Tycho's original design remembers longer than the people living in it do."

Katria went quiet for a long time. Bobbie felt the anxiety growing in her gut. It had been a mistake to bring the Voltaire Collective in on this. It didn't matter how much Saba trusted them or how good they were with demolitions. She should have kept it just within her own crew, where she could control it. Where she was sure of everyone ...

"I don't like it," Katria said, shaking her head. "A lot of moving parts. The more pieces there are, the more ways there are for it to break."

Bobbie shrugged. "If the time wasn't so short, I'd do something simpler."

"All we need is the right bomb, the right place," Saba said. "You give us those, and we take the mission from there."

"No," Katria said. "You need the charges, you need someone to put the charges in the right places at the right time. And need someone on the remote switch who doesn't panic and throw it a little too early and take out your team. And even if they don't, do you think someone in a rad shelter's going to live through that blow?"

Naomi cleared her throat. "They're rated for it. But you're right. We can't know until we try."

"What's the evac plan once your little Armageddon is over?" Katria asked.

It was more than Bobbie had wanted to say. There should be some parts of the plan that weren't being shared. Saba paused, weighing whether to bring Katria that far in. When he spoke, his voice was surly. He didn't like having his hand forced any more than Bobbie did. "Vac suits in the shelter. Go out through the hole. Same airlock we used to bug the line the first time, we use it to get back in."

Katria took control of the model again, turning it, moving through the lower reaches of Medina deck by deck. "It's going to kill people," she said. "When the engineering decks start breathing vacuum, not everyone's going to make it to the shelters."

“Savvy,” Saba said. “Has a price.”

“Is it one you’d pay?”

“Is,” Saba said, but Holden’s expression had a distance to it. Bobbie could tell what was in his mind. There could be innocent people on the decks when the time came. At best, their plan would risk them. At worst, some would be killed. If Saba and Katria were bothered by the idea, they didn’t show it. Holden was bothered by it. She wondered if he’d stand on principle and scrub the whole thing. It was even money, knowing him.

“Demolition team goes here,” Katria said. “Plant the charges, then fall back to the shelter and wait for the team with the stolen data to arrive, then blow it. Everyone leaves together, or no one does. It’s not my first time on an op like this. You’ll need a couple more vac suits, is all.”

Bobbie didn’t catch the important word until Clarissa spoke, her voice gentle and questioning. But Bobbie heard the sharpness under it. “*Your* first time on an op like?”

“Who else?” Katria said. “If you want it done right, you get the best to do it. I’m the best. I make the charges, I place the charges, and it’s my steady hand holding the detonator.”

The room was quiet apart from the soft hiss of the air recyclers and the soft, harmonic thrum of the ship. The hint of old sewage smelled a little worse. Saba had only wanted the Voltaire Collective involved for material support. They weren’t looking for another player when the operation took place. But telling Katria she couldn’t be active in the field ... would it insult her? And if it did, would that be enough to get her to turn on them?

“Sounds good,” Amos said. “You and me on the demo team, Miss Kitty.”

His smile was placid and empty. Bobbie felt a shock of alarm. She met Holden’s gaze and shook her head a millimeter. *This is a very bad idea.* Holden swallowed, nodded, forced himself to smile as well.

“All right, then,” Holden said. “Clarissa leads the support team on environmental controls for Alex. Alex pilots in the drone swarm. Bobbie and Naomi take care of the server, and Katria, Amos, and I will set the charges to cover it all up afterward.”

Bobbie leaned back, a lump forming in her gut. Adding Holden in was *not* a better solution.

“This’ll be great,” Holden said.

Chapter Thirty: Singh

SOL OPERATION NEARING COMPLETION. PREPARE INITIAL SHIPPING AUTHORIZATIONS.

Singh read Trejo's message over twice, joy blooming in his chest. He took a moment to send the order to his section heads and group commanders, and pulled up what everyone jokingly called the "occupation calendar." Even based on the amended projections from Laconia that included not pausing to rebuild the battery, the immediate transit of the *Tempest* to Sol system, and the early deployment of the *Typhoon*, they were weeks ahead of schedule. They'd built some flex into the schedule in the event that the Transport Union put up a more bitter fight to hold Medina, or the Earth-Mars Coalition Navy had revealed naval forces or technology significantly greater than their estimates. But neither thing had turned out to be true, and sooner than anyone expected, they could get down to the business of building the new human civilization.

The sad fact of the human species that High Consul Duarte understood so well was that you could never overcome tribalism and jingoism with an argument. Tribalism was an irrational position, and it was impossible to defeat an irrational position with a rational argument. And so, instead of presenting a logical plan for why humanity needed to give up the old national and cultural divides and become a single unified species, the high consul obeyed the old forms that everyone would understand, and went to war. Thankfully, a brief one.

The real work, the work that would let Elsa grow up in a universe that was safe for her, and for her children's children's children, was the work that came after the conquest of the rest of humanity. Work that required stability.

"Ensign," Singh said at his monitor, which was currently flattened out on his desk. He'd appointed a temporary replacement for Lieutenant Kasik, and he hadn't quite memorized her name yet.

“Governor?” she replied a moment later.

“Please send my compliments to President Fisk, and let her know we’re sending a cart to pick her up. I need an immediate meeting to discuss some urgent matters. Do not take no.”

“Yes, sir,” the ensign replied. “I also—”

“Right away, Ensign,” Singh said, then took a look around at his office. The flowers someone had placed in a vase on his corner table were dying, and the shelf that held his coffeemaker was a mess. “Also, send in someone to make fresh coffee and replace these flowers before the meeting.”

“Yes, sir. I wanted to also let you know that you have an incoming message from Laconia. The *Storm* just sent it over.”

“Send it through. And please let me know five minutes before President Fisk arrives.”

“Of course, sir,” the ensign said and then killed the connection.

Singh tapped on the glowing message button on his monitor and it projected a still picture of his wife holding Monster.

“Play message,” he said.

The still image sprang to life. The recording must have started midway through her expression, because Nat’s face went from an enigmatic Mona Lisa smile to her normal wide grin. Monster didn’t seem all that interested in the camera lens, and instead was focused on something over her mother’s shoulder. They were both beautiful, and Singh felt an emptiness in the pit of his stomach that was always there, but that he managed to ignore until he saw their faces.

“Hi, Sonny,” Nat said to the camera. She held up Monster’s hand and waved at the screen with it. “Say hi to Daddy.”

“Hi, sweetie,” Singh said to the recording like an idiot. He couldn’t help himself.

“I know you’re so busy right now, but we have some good news to pass along,” Nat said. She put Monster down, and the girl ran off out of frame. Singh felt irrationally disappointed to see her go. “My work with sheep modification has been approved for the next round of live testing. We could go wide with it in the next thirty months. Which means a posting to Medina would actually help me move the project forward. No pressure, or anything.”

She smiled as she said it, but he felt the loneliness echoed in her eyes. She continued. “Monster is doing well. She’s a little bored, and so ready to

move into the big kids' room at school. She spends most afternoons with your dad, and they're becoming the best of friends. She calls him Poompaw now, and he's started insisting everyone else call him that too. Most days he doesn't want me to take her when I get off work. We eat dinner at his place a lot of evenings."

Singh felt a swell of love and gratitude for his father that he'd never felt before he had a child of his own. He paused the video playback and took a moment so he wouldn't get maudlin and weepy. It wouldn't do to bring Carrie Fisk in and begin delivering his orders while his eyes were goopy and red. When he'd gathered himself, he started it again.

"So, that's it, I guess. Reply when you get a minute. The home monitor has figured out Monster's version of the word *play*, so she loves replaying your messages over and over again. Love you, Sonny. Be safe out there."

And that was it. Nat saying she loved him shattered whatever resolve he thought he had, and he spent the next several minutes blubbering shamefully to himself.

Someone tapped at his door, and he called out, "Give me a moment!" Then rushed off to his private bathroom. While he was washing his face, he heard the sounds of someone cleaning up his office, and by the time he'd put himself back in shape to see people, there was a fresh pot of coffee percolating on the shelf. A noncom was just finishing up by placing new flowers in his vase. The chief threw him a snappy salute, then faded out of the room like a cat.

Singh sat at his desk, composed himself, then started a recording to Nat. "Hello, my dear. Thank you for the lovely message. I'm so happy to hear things are going well there, and Monster looks very well fed, so my father is almost certainly spoiling her rotten with sweet rolls. Things are still ahead of schedule here. Living here will take some getting used to, but there's plenty of usable land for your sheep and lab, and we're working to get all the services up to snuff for my little girl. Talk soon. I love you, Nat. I love you—" He almost said *Monster*, but something felt wrong about using her pet name. "I love you, Elsa."

He killed the connection, and sent the file for processing to pass it down to Laconia with the next comm dump. He took a lot of pride in the fact that saying "I love you" to Nat hadn't sent him into another weeping fit. There were people who thought that sort of thing was unmanly. Singh didn't care about that. But it was undignified.

“Five minutes,” Ensign Somebody said from his monitor.
“I’m ready,” he replied.

Carrie Fisk sat in a chair in his office, drinking his coffee and looking twitchy and uncomfortable. She’d been picked up at her office by fully armored Marines and driven to the governor’s offices in a convoy of three carts filled with other Marines. For her protection, certainly, but it could also be a little intimidating for someone who wasn’t used to it. If that gave Singh a bit of a home-field advantage when dealing with the minor functionaries on Medina, he’d happily take it. He waited until she’d stopped fidgeting and started paying attention to him, then pulled up a list of the hundreds of ring systems that had habitable colonies and threw the list up onto his wall.

“Madam President,” he said. “We’ve reached an exciting moment for us all, but especially for you as the first president of the Laconian Congress of Worlds.”

“Are we married to that name change?” she asked. “Or ...”

“The name of the legislative body is established in the documentation I gave you after our first meeting. Did you not read those documents?”

“I did,” she said. “I just wasn’t sure if that was a working title, or not. We haven’t voted on adopting the new—”

“You do not vote on directives delivered from the executive authority of the high consul’s office.”

“I see,” Fisk said. She stared at her lap and blew steam off her coffee.

“As I was saying,” Singh continued. “This is an exciting time for us all. High Admiral Trejo has decided that our situation is now secure enough to allow limited trade to resume through the gates.”

Fisk looked up at him with genuine surprise. “What?”

“Yes. *Limited* trade can be scheduled starting now. Put together a list of the worlds in the greatest need, as well as a schedule of deliveries that can meet those needs. Not from Sol system. Not yet. At first, we’ll allow a single ship transit per week, and of course each transit must be approved by me personally at least thirty days before it’s scheduled to occur.”

“That’s actually—” Fisk started, then stopped for a moment. “That’s

actually really good to hear. There are a lot of colonies barely hanging on by a thread. This will save lives.”

“And that is, of course, always the first priority of our respective positions.”

“Ah,” Fisk said, then leaned forward to put her coffee cup on the edge of his desk. As Singh frowned at it and the disrespectful informality it denoted, she said, “On that topic I passed along your threat to every colonized world. I also extended your invitation to the planets that have not already joined the association—forgive me, the Laconian Congress of Worlds—to elect a representative to join our group once trade has resumed. I assume some of those planets will be asking to send their new reps along with the trade ships.”

“That’s good,” Singh said. The Laconian Congress of Worlds was something High Consul Duarte insisted on to make the member worlds feel like they had a voice in government. As annoying as the idea of dealing with thirteen hundred Carrie Fisks would be, the high consul’s opinion on this topic had the force of law, so he’d do his best to see that the new legislative body succeeded.

Fisk was still staring at him, waiting for some sort of answer.

“And?” he asked.

“And, if some of these transiting ships are carrying newly elected representatives, they’ll need permission to dock or send shuttles to Medina. Does the lifting of the transit ban also include permission to dock with the station?”

Which was an excellent question, and Singh was annoyed that Carrie Fisk had thought of it before he did.

“Permission will be granted by this office on a case-by-case basis. Requests to be filed at minimum thirty days prior to the transit,” he said, feeling like it came across as established policy and not something he’d just made up on the spot. He’d need to document that once Fisk left.

“Thank you, Governor,” Fisk said.

“It’s important that this feel familiar, stable, and safe as quickly as possible,” Singh told her. “To the degree possible, you will use Transport Union ships and pilots. The union will also handle the pickup and delivery of goods using their existing policies. Other than the approval process for transits, everything should work the way it did before.”

“I’ll send out a notice to the union reps here on the station, and to the

local leadership on each world.”

“Excellent,” Singh said, standing up and reaching out to shake her hand. “At the risk of sounding repetitive, these are very exciting times for us all.”

Fisk didn’t stand. She sat in his chair squeezing her hands and not looking at him. When the silence had become uncomfortable, he said, “Was there something else, Madam President?”

“There is,” she replied, looking him in the eye for the first time. She showed no sign of standing up to leave, so he sat back down again.

“Then out with it,” he said, immediately regretting the snappish tone. “Please.”

“We’re—I’m doing everything you asked. I’ve passed along your messages to the worlds. I’ve asked for reps to be sent from every planet that wasn’t already part of the association. I’ve passed along President Duarte’s —”

“*High Consul* Duarte,” Singh interrupted her.

“Of course,” she said. “I’ve passed along the high consul’s very detailed documentation on convening the new Congress of Worlds.”

“*Laconian* Congress of Worlds,” Singh said.

“Of course. But so far, that’s the only thing my office has done. Act as press secretary for *your* office. And, with all due respect, that is not what I was voted into my office to do.”

She looked nervous saying it, and Singh gave her a minute to stew in her worry. If the mouse wanted to grow some claws, that was probably a good thing in the long run. The Laconian government had no use for those who wouldn’t fight for what they believed. The high consul made it very clear that every conflicting viewpoint should have a vigorous proponent, so that everyone felt that the final decisions were made only after everything was considered fully. A planetary congress run by mice wasn’t useful to anyone.

“And what,” Singh said after he’d let her squirm enough, “would be a better use of your time, Madam President?”

“If we’re to be the legislative body of this new government, when do we actually start legislating? You’ve brought me in here to deliver these directives for me to disseminate, but not once have we *voted* on them. I feel that very quickly we’ll be viewed as a congress in name only, in place to rubber-stamp your orders.”

“As the governor,” Singh replied, “I am here as the direct representative of the executive branch, and the office of the high consul. You don’t *vote* on

orders from the high consul.”

He couldn’t help but laugh a bit at the very ridiculousness of that idea. As if the high consul might change his policies because of a vote.

“Then,” Fisk replied, “what do we vote on?”

“When the high consul’s office has decided on this year’s legislative agenda, you will be the first to be notified, Madam President. Until then, please continue working with the member worlds to ease their transition into the new government. And I assure you, that will be an *excellent* use of your time.”

“Okay,” Carrie Fisk said, and stood. “I’ll just go make sure my rubber stamp is all warmed up.”

Singh didn’t stand to shake her hand. “You are dismissed.”

Singh was still mulling over the deeply unsatisfying meeting he’d had with Carrie Fisk when his monitor buzzed and Overstreet’s voice came over the speaker.

“Sir, I have a ... gentleman who says he has important information for you.”

“Can’t he give it to you?”

“He’s reluctant to, sir. Says it’s for the top man only. I think it might be worth the interview.”

That was interesting. Even if the alleged information turned out to be nothing, he was curious to see what sort of thing Overstreet thought important enough to engage him.

“Do we know this person?”

“No, sir,” Overstreet replied.

“I assume he’s already been searched for weapons.”

“Yes, sir.”

“Give me two minutes, then,” and Singh closed the connection. His office was still neat and tidy from Fisk’s visit. He sat up straighter in his chair, and pulled his uniform jacket tight. He turned on his monitor’s front-facing camera and examined himself. Secured and shipshape. The very picture of a military commander.

There was a discreet knock, then two Marines walked in with Overstreet

and a tall, thin man of the generic Belter variety. The only feature this one had that seemed different at all was his comically large nose. It was misshapen from repeated breaks, and had a large scar on one nostril. Clearly a man who'd been in a few fights, and who did a poor job of keeping his hands up while boxing.

"You asked to see me?" Singh said. He did not offer the man a chair.

"My sister in one of them cages you got out there," the man said, clearly working to keep his accent as Belter free as possible, and only sort of succeeding.

Singh glanced at Overstreet.

"Not one of the people involved in the bombing, Governor," Overstreet said. "Petty theft from a merchant."

"A military tribunal has been formed, and the cases will be adjudicated promptly and in the order they were filed," Singh replied. "Is that all?" It couldn't be, or Overstreet wouldn't have brought the man to his attention, but he was willing to let the Belter do some of the work here.

"All that shit you said, about we help you, you help us? That just the merde or what?"

"It's the truth," Singh said, feeling a glimmer of interest. Overstreet had what could have been the ghost of a smile on his lips. "Are you here to help me?"

"Let my sister go. She's just stupid, caught stealing, no threat to you. Let her go, I know something you want to know." The man rubbed his big, lumpy nose nervously as he spoke. "Something coming, and I know the coyo behind, yeah? Deep in with Voltaire Collective, me."

"You're in contact with the forces behind the bombing?"

"Maybe," the broken-nosed man said. His bravado was barely thick enough to stretch across his fear. "If there's enough in it. You tell it to me."

Singh paused for a moment, letting the silence stretch. A network of locals loyal to him. Dependent on his generosity. It was all coming together so well.

"I think you and I are about to become friends," Singh said.

Chapter Thirty-One: Drummer

Sleep and Drummer had developed an uncomfortable relationship. Its worst aspect was the time it left her to read the public comment boards and newsfeeds.

THIS SENSE OF PURPOSE IS EXACTLY WHAT MARS LOST WHEN THE GATES OPENED. THIS ISN'T AN INVASION AT ALL. IT'S THE RETURN OF THE REAL MARTIAN SPIRIT TO ITS PROPER PLACE, AND I AM HAPPY—FUCK, *DELIGHTED*—THAT I HAVE LIVED LONG ENOUGH TO SEE IT.

The way it played out was predictable. During her days, she felt like People's Home was turning too fast on its axis. Only it wasn't just her body that was getting spun. Her mind was too heavy to lift. She was controlling herself with a bad lag, like driving a mech with choppy software or running a waldo at the edge of its range. Meetings with the union board, with the EMC admiralty, with her own staff. Interviews and speeches in which she declared the independence of the union. She got through all of them with a physical sensation like her brain was evaporating. All she wanted to do from the start of her shift to the last moment before bed was close her eyes.

And then, as soon as she did, they opened again, as if by themselves.

THESE ASSHOLES SHOULD HAVE BEEN CUT OFF BEFORE THEY COULD GET THROUGH THE GATE. THIS IS EXACTLY THE PROBLEM I'VE BEEN TALKING ABOUT FOR YEARS. A TRADE UNION DOESN'T MATTER FOR SHIT WHEN AN ARMY COMES KNOCKING. IF YOU EVER NEEDED ANY PROOF THAT THE TRANSPORT UNION ADMINISTRATION WAS INCOMPETENT, THERE YOU GO. IT'S RIGHT HERE FOR YOU, AND IN SPADES.

She'd try to rest. Try to lure sleep back. Her eyes felt gritty. Her mouth felt dry. She wanted to eat, even though she wasn't hungry. Wanted water, even though she wasn't thirsty. It was like her body knew it needed something, and all it could do was run through the list of possibilities over and over, hoping that something would give her solace that hadn't the last time. She found herself craving a pipeful of marijuana, even though she

hadn't smoked in decades.

She waited an hour, maybe two, then got up and spooled through the feeds and networked discussions with a dummy account she'd made for the purpose. She told herself it was research, that she was gauging the morale of the populace. It was easy to pretend that she was somehow learning something that would help. It felt like tearing off a scab and pressing salt into the opened sore, but it was better than paging through the names of the dead. Emily Santos-Baca ...

From Ganymede, an independent journalist's twenty-minute recording on the importance of solidarity in the face of the enemy. An old Earther's open letter about surviving the terrible years after the rocks fell and why this time was different. A roundtable discussion by an open salon on Ceres about how the union was or wasn't able to rise to the occasion and address the Laconian threat. A dozen languages, a thousand faces and voices and rhetorical styles. If she was looking for clarity there, she didn't find it.

MY WIFE IS ON MEDINA STATION. I JUST GOT A MESSAGE FROM HER SAYING THAT THE LACONIAN GOVERNOR IS OFFERING BETTER TERMS THAN THE TRANSPORT UNION DID FOR EVERYONE WHO WORKS FOR THEM. AND SHE SAID THE TECHNOLOGY THAT'S COMING THROUGH LACONIA GATE IS GENERATIONS AHEAD OF ANYTHING WE HAVE. I KNOW IT'S NOT A POPULAR OPINION, BUT IF THEY'RE GOING TO TREAT THE WORKERS BETTER, BRING BETTER EQUIPMENT, AND STAY OUT OF OUR BUSINESS OTHERWISE, I THINK OUR REAL ENEMY IS THE BUREAUCRACY IN THE TRANSPORT UNION OFFICES!

There were other voices—many more of them, really—that saw the attack on Medina for what it was. She read essays on defiance in the face of tyranny, listened to music designed to rally the patriotic against the enemy. A school on Luna had started a campaign where the children were dyeing their right hands red in defiance of Laconia. The symbolism of it escaped her, but the trend spread far past the school, and half of the interviewers and journalists on the feeds had some version of it. Red gloves or finger sleeves or rings.

If she'd wanted to feel hopeful or resolved, it would have been easy to find those people and spend her insomniac hours only with them. But like a tongue prodding a sore tooth, she kept reaching for the others. Laconia is the future. The conquest is inevitable. Stop the war.

Capitulate.

There were also whole subfeeds devoted to speculating on the strategy

of the EMC and the union. Some of the conversations there were eerily like briefings from the EMC admiralty. Others were desperation-fueled optimism dressed as military theory. None brought Drummer any more hope than she'd had before, and some left her mood darker.

And she hadn't heard from Saba. Even when Medina lifted its comms blackout for propaganda, there'd been no message from him. From the others fighting against the occupation. She imagined that he was still there, sneaking between the decks like a rat made for gnawing through steel. That Medina would fall, and she'd hear his voice declaring their victory. Or failing that, that she'd hear his voice at all.

And behind it all, pressing down on her soul like a suffocating hand, the *Tempest* made its vast, stately way sunward. Already past the halfway point. Already braking. She understood their strategy perfectly. A single ship, making its way for everyone in every system to see. It was a demonstration of authority. Of inevitability. A piece of theater designed to humiliate, to subjugate, to control.

It was what she had done to Freehold.

That, as much as anything, kept her at the table in her quarters as the hours of sleeplessness slipped by. When she'd made the call, it had seemed like the obvious thing to do. Hard, yes, but in the service of a greater peace. A more orderly universe. Someplace where there'd be some respect for the rules.

The colonists on Freehold had made their choices. They'd broken the rules she and the people before her had set down. She'd felt justified when she sent the *Rocinante*. Now she wondered whether the colonists there had sat up in their beds in the night. Wondered how they would feed their children. Whether there was some way to finesse their way out of the future that was bearing down on them. Probably they had.

Maybe this was the way the universe showed her the errors of her ways. Taking the evil that she'd committed so offhandedly and turning it around to point at her. Her and Santos-Baca. All the refugees of Independence. All of the void city's dead. If it was, then the universe hadn't embraced the idea of proportional response yet.

The small, quiet part of her mind that watched all the rest knew that she wasn't right. That there was no way for her to be right, not in a situation like this. If she'd been able to sleep, maybe. But the fear was eroding her bit by bit and taking away all the things that let her recover. Like a recycling

pond with a plugged drain, she was filling with shit, and sooner or later, she'd overspill. It wasn't a source of anxiety. It was just something she knew about herself, as if she were thinking about some different woman.

She drew her robe closer around her chest, spooled through the feeds. Watched a few seconds of the news from Loundres Nova, a few seconds out of the shipyards at Tycho-Pallas Complex, Ceres, Luna, Earth. Never enough to hear a whole story.

Weirdly, not all of it was about Laconia. There was a fire at an arcology outside Paris. A popular musician Drummer had liked as a girl had died. It was as if not everything were defined by Laconia and Duarte and her own failures. And then the top traffic on the feed would re-sort, and there was an image of the *Tempest* in all its threat and glory.

Holden had been right. Her plan for Freehold had been cruel, and she'd done it for the convenience of not being a government, not really. So that she could be unprepared when a navy no one knew existed arrived in force. She should have been kinder, wiser, more cunning. She should have been something other than what she was. There had to have been a moment when she could have chosen something different, when all of this could have been stopped. She couldn't think when it had been.

Her system made its tock. If she'd been asleep, her lights would have come up.

"Ma'am?" Vaughn said. Not even his nighttime staff. Whatever it was, they'd woken him up for it first, and he'd made the decision to wake her. That couldn't be good.

"I'm awake," she said.

"We've had a message for you from the *Tempest*. It came in on tightbeam an hour ago. Signal intelligence says it's genuine."

"Not broadcast?"

"No, ma'am. Unencrypted, but not broadcast."

Something the enemy wanted her and her people to see, but not as a press release. The switch in her mind flipped, and she wanted nothing more than to crawl into bed and sleep forever. "I'll take it in my room," she said.

Her screen went dark, and then Admiral Trejo was on it, looking out at her as if he could actually see through the screen and light delay. His expression was almost rueful. That would be a pose, of course. A decision he'd made about how to appear. She hated that, even knowing that, she felt herself hoping he could be reasoned with. Wanting to like him, because then

maybe he'd like her. Stockholm syndrome's first, pale roots. She pushed the gentle impulse away and summoned up her hatred.

"President Drummer," he said. "I hope I find you well. On behalf of High Consul Duarte, I'm asking again for the Transport Union's ships to stand down and accept administration by the Laconian Empire. But I understand if that answer is still no. I'm going to keep asking until you change your mind, though. The sooner that comes, the less loss of life your people will suffer. Their fate is entirely up to you.

"If we do not have your unconditional surrender within eighteen hours, though, then I'm afraid things will become less pleasant. I have been ordered to deny you the use of the shipyards at Pallas Station. I'd rather get through this with the least loss of life and infrastructure. Again, entirely in your control. You can end this at any time.

"I am tendering a similar offer to the EMC, and I imagine you'll all want to talk this over. I urge you in the strongest possible terms to do the right thing and lay down your arms. The high consul has given me a certain amount of latitude in how we bring this unpleasantness to a close, but the longer this drags on, the less freedom I'll have. And the worst-case scenario isn't something I relish.

"Confer with your colleagues at the EMC, and reply back to me as soon as you can. If I don't hear from you, I'll assume you've chosen to protract this a little farther. The blood of Pallas Station will be on your hands. I sincerely hope and pray that you'll be wiser than that."

He gave a little nod, and the message ended. Drummer's rage was sluggish and muddy from lack of sleep, but it was hot. She made the connection request, and Vaughn picked it up immediately.

"How many people have seen this?"

"The comms officer on duty, my assistant, me, and now you. Only four."

It was two people too many. Maybe three. Still it might not find its way onto the nets, depending on how well the EMC controlled information in its house. It was the nature of bad news to spread, and once it was out, it was out forever. She had to assume that she didn't have much time before it did. One more chance to try being the person that the situation called for instead of just herself.

If she were the person who should be here, if she were the leader that the union and the system and humanity needed, what would she say now? How would she say it?

“Wake Lafflin up, and get Admiral Hu on the horn. We’re going to need a talk.”

Pallas Station, Trejo had called it. Not Pallas-Tycho Complex. One of the strange things about Laconian language was the decades of linguistic drift. No one had called it Pallas Station since before Sanjrani had been in charge of the union. He’d overseen the update of Pallas’ refineries and the semipermanent installation of Tycho Station as the primary shipyard of the metals and ceramics, lace and nanolaminates produced there. It had been more efficient than leaving Tycho independently on the float. There were generations of work that would need to be done, and putting everything in the same place made it all go faster.

People’s Home had been assembled there. And Independence. The void city Assurance of Peace was half-together now, its vast carbon-silicate ribs still bared to the vacuum. Thousands of families lived and worked there, and would for another few hours, unless Drummer capitulated.

“The loss of building capacity would set us back by decades,” Admiral Hu said. “Any chance we have of rebuilding and fortifying a navy relies on that station. This would cause a bottleneck that would radically change our projections.”

Drummer shifted in her chair. It wasn’t the first time she’d listened to the message.

“Deploying the full force of the EMC-and-union-combined navy can’t be accomplished in the time frame described here.” Hu’s face was replaced by a schematic of the system, each fleet marked with its time to engagement. They’d been keeping the ships scattered to deny the *Tempest* a single target-rich environment. Here was the trade-off for that ...

“And furthermore, only three-quarters of our ships have completed resupply with the torpedo modifications based on our first engagement. Our strategic analysis is that a decision to sacrifice Pallas-Tycho Complex in order to fully prepare the combined fleet will degrade our long-term readiness, but increase our chances of making a decisive blow against the *Tempest* in the short term. Of course, any decision requires full coordination between the union and the EMC.”

Whatever she chose, they would do the same. In the midst of the apocalypse, the military brass on Luna were still playing cover-your-ass. That seemed like the most optimistic thing about the whole report. They still thought they might have careers worth losing when this was over.

Drummer could remember living on Tycho Station. She could still walk through the corridors in her memory. The layout of the engineering decks the way they had been before the refit. The smell of the habitation ring. The office she'd inherited from Fred Johnson after his death. He'd had a personal cabinet there with a few things—an old book, a bottle of brandy, the physical copies of some of his personal initiatives that had foundered after he'd gone. She'd been the head of Tycho Station for three years before she'd cleared that out, and she still remembered how it had felt when she had. Like a widow finally selling off her dead husband's suits.

When she looked at Pallas-Tycho Complex, she felt the same way again. She wanted a way to save it. She kept looking for the clever move that would put it out of the enemy's hands, only there wasn't one. It was already too late. She could hand it and any chance of freedom away, or she could see it destroyed. One or the other. And she had to choose.

“Vaughn?”

“Madam President?”

“We need to put out an emergency evacuation order for Pallas-Tycho. Everyone who doesn't have their own craft, put on Tycho and break it away from the complex. No one is to be left in the Pallas structures, and the highest possible burn for all ships and Tycho Station is recommended.”

She looked over at him. His face was grayish. His eyes were dead as a shark's. He didn't argue, though. He only braced, turned, and left the room to carry out her order. Even if he disagreed with her, he was probably glad he hadn't had to make the call. She would have been.

She set her system to Record, considered herself on the screen. Her eyes were sunken with exhaustion and despair, but not as badly as she'd thought they would be. Her skin had a waxy look in the bright light of her private office. She'd want to have the communications staff get her some powder and rouge before she made the public announcement. God, there would have to be a public announcement. But that was later. That was next.

She keyed in the reply code, and the high-security link to Luna showed Ready. She coughed and looked into the camera.

“Admiral Hu, I have given the evacuation order to Pallas-Tycho,” she

said. “Even if we can’t save the station, we can make it harder for the *Tempest* to kill the population there. And seeing whether they feel the civilian targets are worth hunting down may also give us greater insight into the character and aims of the enemy. I advise the EMC forces to refrain from any premature engagement with the enemy at this time.

“It is my opinion that attempting to save Pallas Station would have been an error,” she said. “It would be better to prepare the forces we have at our disposal for a full, coordinated, and unrestrained engagement under circumstances more nearly in our control and to our advantage. And with the modified torpedoes and munitions available to all ships. Whatever gives us the best chance in that battle is worth the sacrifice.”

She paused. She was thinking this all through as she said it. The implications of the choice she’d made and the future of the war.

“We only have one shot at this,” she said. “There isn’t room for half measures. We’re going for the kill.”

OceanofPDF.com

Chapter Thirty-Two: Holden

The electric cart they rode on seemed almost as old as the station. The magnetic wheels gripped the ramp and kept them on track even as the spin gravity of the drum fell slowly away. If Medina Station had followed its intended path, it would have been well away from Earth by now, gone into the vast depths between the stars where spare carts were pretty hard to come by. The Mormons had built everything about the ship to last for generations, to grow and renew itself, to recycle with the least possible loss. Medina Station would outlive them all.

Except that he was going to blow a hole in it.

Amos rode shotgun, his hands splayed wide on his knees, his head freshly shaved. From his place in the backseat, Holden mostly saw the back of the big man's neck—white skin flecked with age spots but still muscular and hard. He didn't need to see the amiable smile to know it was there, and how little it meant. A massive conduit wrench clanked at Amos' feet. Katria drove with the studied boredom of someone who knew the consequences of drawing the attention of station security. Her hair was already in a tight bun, prepped for the null g of engineering. She tapped her palm against the side of the cart as if she were listening to music, so maybe she already had her earpiece in. Holden tried to lean back against the seat, but in the lower g, it just scooted him forward. The bomb rested on the bench beside him like a fourth person.

It wasn't big. A square box, safety orange with scratches at the edges and corners, the marks of long use. He didn't know exactly what was inside it, only that Katria was certain it would blow the right kind of hole into the pressure tanks and that the ruptured pressure tanks would blow the right part of the station apart. She also said that, in its present form, it was both hard for security to detect and stable enough to play football with if you didn't mind a square ball. Still, Holden didn't rest his elbow on it.

They were nearly at the top of the ramp when a line of carts stopped

them, all heading the same direction as they were and all stuck waiting. At the entrance to the transfer point, three Laconian Marines in power armor were talking to a dark-skinned woman in a green jumpsuit.

“Checkpoint,” Holden said.

“Inconvenient,” Katria said. She sounded like it was an annoyance more than an immediate threat to all their lives and the safety of everyone in the underground who was counting on them. He really did admire the way she did that.

The raid had come two shifts before, when Holden had been in his sleep cycle. Between the time he’d curled up in the bunk and put his head on the thin pillow and when he’d opened his eyes again, a quarter of Saba’s people had been snatched up and a man named Overstreet was on all the screens in the station telling the rest of Medina about it. And the *Typhoon* was already past its flip-and-burn, braking now toward the other side of the Laconia gate. They weren’t saying exactly when it was supposed to arrive, but their data placed it at around ten days. And the news from Sol looked grim, even correcting for the fact that it was all coming through the state-run newsfeed.

The noose was drawing tight. And in order to have any chance of escaping it, they were about to at least risk the lives of, and most probably kill, a bunch of people who were on the engineering decks at the wrong time.

“Holden. Do you have to do that?” Katria asked.

“Do what?”

“Grunt.”

“Was I grunting?”

“Cap does that when he’s thinking about something he don’t like,” Amos said.

“He has a wide variety to choose from,” Katria said.

From the way they talked, Holden could almost believe that they wouldn’t kill each other, given the chance. Almost, but not enough that he was sorry to be there. Maybe Katria really didn’t hold a grudge about the fight that Amos had started. And maybe Amos wasn’t spoiling to start another one. Or maybe the bomb was the most stable thing in the cart.

“I’ll think happy thoughts,” Holden said. “Butterflies. Rainbows.”

“What the fuck is a butterfly?” Katria said.

The cart ahead of them shifted, and they followed. It took fifteen minutes to get to the guards and then a minute and a half to get past them.

Their cover story—Holden and Amos were applying for on-station work permits since their ship was locked down, and Katria was taking them to an on-site test—never even came up. Katria drove the cart to its queue, strapped the bomb to her back, and led them into the engineering decks, moving from handhold to handhold with the unremarked grace of someone who'd spent a good portion of their life on the float. Amos followed with the conduit wrench in his fist like a club.

Once the drum was well behind them, Holden pulled the earpiece out of his pocket and turned on the contact microphone.

“—is clear,” Clarissa said. “Can you confirm?”

“Yup,” Alex replied, his voice slow in the way that meant he was concentrating. “I’m moving my little pixies through now. Gimme just a ... All right, I’m through.”

“Turning the recycler back on,” Clarissa said.

Clarissa and her team were in the drum, tapped into the environmental controls through a back door that, if they were found out, Saba would never be able to use again. Alex was back in the underground’s galley, flying the drones with his hand terminal and several layers of encryption. Naomi and Bobbie were, he assumed, loitering outside the secure server room, ready to force their way in. It was strange hearing their voices as if they were with him. It made him feel like he was back on the *Rocinante*.

The engineering decks of Medina were a lesson in the way ships learned and changed over time. If he squinted, he could still see the bones of the original, unmodified space, but years and mission drift had altered everything. Here, a section of floor had a slightly different color where a bulkhead had been taken out. There, a set of conduits had been rerouted with the three-point welding style that Martians favored. The pipes along the walls were labeled in half a dozen languages and safety-regulation styles. History made physical. Even where the walls were had changed over the years, added extra reinforcement from when the docks had been built or taken away when the new generation reactors had been put in place. Katria led the way down a side corridor, moving from handhold to foothold to handhold. Amos followed close behind her, only crowding her a little, and she seemed not to notice. Or at least not to care. Their little triumvirate. Katria to place the charge, Amos to keep an eye on her, and Holden to keep an eye on him.

A young woman floated past them, coming the other way. She had an

electrician's rig strapped to her arm, and her hair was the same texture Naomi's had been when they'd first met. She passed Katria, then Amos. When she and Holden landed at the same handhold, she smiled an apology and pushed quickly off. He wondered whether they were about to kill her. Seemed possible. He hated the thought.

"Alex?" Bobbie said. "You're awfully quiet there, buddy. Everything all right?"

"Yeah, sorry. Just ... there's a little lag. It's not bad, but it makes me paranoid. Last thing I want is one of these charges to go off in a vent someplace. Take the whole group out."

"That would be bad," Bobbie agreed.

"Jim?" Naomi said. "Are you on yet?"

"We're here," he said softly. "Past the checkpoint. Not at the pressure tank yet."

"There was a checkpoint?" Bobbie said.

Amos' voice was calm. "Nothing we couldn't handle, Babs."

"I'm coming up on the last turn here," Alex said.

"There's a carbon dioxide scrubber intake," Clarissa said. "Don't get caught in the draft. I'm accessing it now."

Katria started whistling between her teeth, a tuneless sound that her mic didn't pick up. They reached an access panel with caution placards in a dozen languages and half the colors of the rainbow. CAUTION HIGH PRESSURE SYSTEM. Katria plucked a knife from her boot and pried the panel open as casually as if she did it every day.

"Make sure no one's coming," she said.

"You got it," Amos replied, sailing on a little farther down the corridor and slipping to the center of the narrow space so that anyone coming the other way would have a hard time getting past him and his massive wrench. Katria pulled the bomb off her back and popped the case open. The workings inside didn't look like much. A cone of carbon-silicate lace, the same as a ship's plating. A hand terminal. A pair of standard wires. It didn't look like enough to do much damage. Certainly not enough to blow out the side of the station. But of course, it wasn't. That was all coming from the pressure tanks on the other side of the bulkhead. This was just the pin that popped that balloon.

"Okay," Clarissa said. "You're good to go."

"Heading through," Alex said. "And we're past. The vent for the server

room should be just ahead. Looks ... looks a little higher grade than I was expecting.”

“Do we have a problem?” Bobbie asked. He could hear the tension in her voice. The electrical technician he’d bumped into intruded into his memory, and with it the faint and compromised hope that maybe it would all go wrong and they’d have to abort the mission.

“I think we’ll be fine,” Alex said. “My little pixies here are armed for bear. But I’m pulling five of them back around the corner here so they don’t get mussed up when the vent goes.”

Katria closed the case, set it in behind the access panel, squinted at it, shifted it fifteen degrees. What was it like, Holden wondered, being able to picture blast cones in your mind? What kind of life did you have to lead to have that come naturally? Katria rubbed her throat, and when she spoke, her voice had doubled, coming from the air they were breathing and through the earpiece. The reverb gave her words a weight.

“We’re done here. We’ll see you in the place.”

Meaning, the shelter. Where, when Naomi and Bobbie joined them, they could trigger the blast and wipe out the evidence.

“Hey,” Katria called down the corridor. “You coming?”

Amos floated back toward them as Katria slid the panel back into place and slipped her knife back into her boot. They were skimming along through the air together when it all fell apart.

“Um,” Alex said. “I think we’ve got a problem here.”

“What’s up, Alex?” Bobbie asked.

“Well, I got my little pixie looking through this vent. I’ve got eyes on both of these Laconian fellas, and one of them’s got his hand on something that sure looks like a dead man’s switch.”

“That’s not protocol,” Bobbie said.

“It ain’t Martian protocol,” Alex agreed. “But I’m pretty certain that’s what I’m seeing here. If I move forward with this, I won’t even have the door open before the Laconian fellas know about it. You’re going to be ass deep in alligators pretty damned quick.”

“We knew we were going to have to move fast,” Bobbie said. “This just means we move faster.”

“It means more than that,” Clarissa said. “It means they’ll log the alarm. The whole point of blowing out the pressure tanks was so they wouldn’t know we’d compromised them. If the secure room shows an alert right

before the explosion, they'll know what we did. They'll change all the procedures. The data we recover won't be worth anything."

The silence lasted one long breath. Then another. Holden felt something in his chest loosen, it was almost like relief. And almost like dread too.

He knew what had to happen before anyone else did.

"All right," Bobbie said, and Holden could see her clenched jaw as clearly as if she were there with him. "Let me think."

"You'll be fine," Holden said. "Just wait until the ... I don't know. The tenth alarm goes off."

"The tenth what?" Alex said, but Holden plucked out his earpiece and the mic and tossed them to Amos. The big man caught them in one wide hand.

"You going somewhere, Cap?"

"Yeah," Holden said. "Can I borrow that wrench?"

Amos pushed it gently out to him. It was massive enough that Holden had to readjust his grip on the handhold to stop it.

"Am I getting that back?" Amos asked.

"Maybe. You get Katria to the shelter. Everything goes forward, just like we planned."

Amos' face went still as a mask for a moment, and then he smiled his empty smile. "You got it."

Holden squared himself on the wall's footholds and launched down the corridor. In an instant, Amos and Katria were behind him. *It'll be okay*, he told himself, but he didn't dig into why that might be true. He was pretty sure it wouldn't hold up.

It only took about twenty seconds to find a panel with a manual fire alarm. He flipped the case open, pulled the switch down, and a Klaxon started screaming. *One*.

In the next corridor, he picked a thin copper pipe, set the wrench around it and pulled until it popped. Green fluid that stank like vinegar and acetate spewed out into the hall. Somewhere, the system would register the pressure drop and raise a flag. That was *two*. He heard voices shouting from the main deck. They weren't raised in panic, not yet. More like they were trying to be heard over the alarm. He passed a radiation alarm and tripped that too—*three*—then headed toward the voices.

Naomi would understand, even if the others didn't. She knew him well enough to follow his mind without so much as a question. There were two

ways to hide something. Either put it where no one could see it or leave it in plain sight with a thousand others just like it. If the alarm went off in the secure room, that would mean one thing. If a bunch of alarms went off all through the engineering and dock levels, and it was only one, maybe the guards had panicked. It would just be more noise in the chaos. Unremarkable.

In the wide space leading to the transfer hub, half a dozen people were clinging to a wall, each of them talking over the others. He recognized the electrical tech they'd passed going in.

"Hey," he shouted, waving his wrench. "Can't you people hear? Get to the shelters!"

It was enough to start them moving. He picked another corridor at random and launched himself down it. He broke three electrical conduits, tripped another fire alarm and another radiation. If he could make his way down closer to the reactors, there'd be more he could break, but there would also be guards there. The wrench was unwieldy and massive enough that cracking the conduits and pipes open was starting to leave his shoulders and palms aching. He ducked into an access crawl and pulled two power exchanges out of the wall. That had to be good for at least one alert. He floated out into another hallway. The engineering deck was drowned in a cacophony of blaring alarms. He pulled himself toward a ladder. When the station was under thrust, it would lead down toward the drive cones.

It took the Laconians about two minutes to find him, but it felt like longer. Holden was trying to fit the wrench behind a support strut when two Marines in power armor came around the corner, their suits clicking as the actuators fired. Holden started to raise his hands, but the first one slammed into him before he had the chance. The impact knocked a few seconds off his awareness. The next thing he was sure of, there was a barrel pressed just above his left eye and his ribs hurt badly when he tried to breathe.

"You just fucked up, old man!" the guard growled.

Holden blinked. "I surrender," he said. Breathing really hurt. There were bones broken. He was sure of it.

"You don't have that option," the guard said. Holden realized his life was now based on whether a Laconian Marine who looked like he was maybe in his early twenties had the self-control not to shoot his brainpan empty out of anger and excitement. Holden nodded.

"I understand, sir," he said, and hoped that submission and respect

would be enough to keep that one critical neuron from firing. “I am not resisting. You got me. I’m no threat.”

“CJ,” the other Marine said.

The one with the gun snarled, pulled back a few centimeters, and hit Holden along the side of his face hard enough to split the skin. Bright red globes of blood flew in a cloud and painted the pale anti-spalling cloth of the hallway. The pain was dull first, and then bright.

“You are an ungrateful piece of shit,” the Marine—CJ, apparently—said. “If we were someplace civilized, your sad ass would be in the *pens*.”

“What are the pens?” Holden asked, and the guard hit him again, hard against his right ear. He had the impression that CJ enjoyed this kind of thing. Holden wasn’t frightened so much as resigned. He’d known that he’d be trading his freedom for the chance that Bobbie’s plan would work. And for the electrical tech’s life. He was past the good part of his plan now, and the bad part might last a very long time or a very short one. Either way, probably the rest of his life.

CJ hauled him out into the free air where there was nothing for Holden to grab onto. A drop of his blood smeared the Laconian’s faceplate.

“What the fuck do you have to say for yourself now, asshole?” CJ said, shaking him just enough to make his teeth rattle. Holden took a deep, painful breath.

“We should probably get to an emergency shelter,” he said.

Chapter Thirty-Three: Bobbie

Tenth what?” Alex said. His voice was reedy and distant. Not all of that was because of the tiny speaker it was coming out of. Alex understood what Holden was doing just as much as she did. One alarm was significant. One alarm out of a dozen meant less. Holden was giving them cover, and Alex was asking Bobbie to say that Holden hadn’t just decided to sacrifice himself to keep the mission on track.

Her mouth was dry.

“You heard him,” she replied, keeping her tone all business. “As soon as that tenth alarm goes off, blow the vent, take out the guards, and get us into the room.”

“Am I getting that back?” Amos asked, but not to them.

Naomi was staring at her, wide-eyed. She was on the radio, too. She knew what was happening. But she tightened her grip on her tools and pressed her lips together, then gave Bobbie a nod. *Good to go*. The *Roci*’s former XO would finish her mission. Then she’d worry about Holden afterward. They both would.

The sound of the alarms had started close to them, and grew more distant as new sirens joined the cacophony. Holden was moving away from them. Which was good, considering what was about to happen.

“Chief,” Alex said. “That was ten.”

Bobbie took one last look at her surroundings. She and Naomi floated alone in the narrow corridor. The door to the computer room was five meters away, and she had her improvised battering ram in one hand. As it always did in the calm seconds before a mission began, her mind ran through the checklist of things that were about to happen. Nothing popped up as a red flag, so she said, “Go, go, go.”

For three long breaths, nothing happened.

There was a distant thump, like a firecracker going off inside a locker. *The first drone just blew itself up to take out the venting cover*. This was

followed by a shout of surprise. Bobbie could picture the two men in the room looking up in shock as the vent turned into shrapnel behind them, and five tiny drones flew into the room. Then two more bangs, close together like firing a double tap with a pistol. This time louder, and closer. *Two more drones going off to take out the guards.*

The alarm in the room started screeching as the man with his hand on the dead man's switch went down. But now, instead of drawing every guard in the area, it was just one of over a dozen alarms going off, and new ones coming up every few seconds. Holden had been busy.

"I'm getting smoke in the vents," Clarissa said. "I'm turning up the recyclers."

The last explosion was the loudest yet, right on the other side of the door. *The last three drones clustering around the latch and detonating.* Alex said, "My guys are done. Me and my team are cleaning up the logs and shutting down."

Bobbie planted her feet on the corridor wall and launched toward the door. The heavy length of ceramic-filled pipe she was using as a ram was gripped in both hands, and she slammed it into the door just above the latch. The door exploded open so violently that it bounced off the bulkhead and swung back hard enough to clip her knee as she flew by. It hurt, but not enough to think about.

She had a split second to clock the room: workstation and two dead men with blood soaking their suits floating next to it, server rack bolted to the deck in the center of the compartment, plain metal walls. She slammed into the server rack and bounced off into an empty corner of the room.

"Ouch. Fuck."

"What's that, Chief?" Alex asked.

"Nothing. Just went a hundred kph when twenty would have done," Bobbie replied. "We're good, Naomi. Do your thing."

Naomi's lean form slid through the opening with Belter grace, tapped one foot against the bulkhead, and came to a perfect stop next to the server rack. Watching her slide through the air like a fish in water made Bobbie feel overlarge and clumsy.

"I'll be in the hall, watching for gawkers," she said.

"Mmhmm," Naomi replied, already ignoring her. She was pulling panels off the server rack, and a variety of gear floated in the space around her like a high-tech cloud.

Before she left, Bobbie pushed over to the two Laconian guards and checked their pulse. Up close, it was hardly necessary. Both men had massive head injuries, and bits of bone, blood, and drone parts floated around them. It was a shitty way for a soldier to die, ambushed like that, and Bobbie pushed down the feeling of guilt and regret. It was war. Right now, her brothers and sisters in the Martian fleet were fighting and dying in the Sol system in that same war. And a lot more blood was being spilled on their side than on the Laconian one so far.

Still, as a person who'd stood a watch in enemy territory, the sightless eyes of the two dead men made her scalp crawl the way she'd always imagined it would when a sniper had you in their sights for the kill shot.

"Your turn now," she told the dead man. "My turn later."

She pushed out into the corridor to keep watch. The shrill electronic screech of alarms echoed down the hall and all around her. So far, no one had come to check on the computer-room alarm. Why would they? Holden had made sure that the only important alarm was drowned out. She had to hand it to him, as an improvised element of the plan it was a pretty good idea. Probably something they should have included, just in case.

Next time, she thought, knowing there would never be a next time.

"Got it," Naomi said from behind her. Bobbie nearly elbowed her in the face before her brain could override the startle response.

"Great," she said instead. "Let's get to the shelter before Katria gets itchy and blows us all to hell for the fun of it."

"Jim won't be there," Naomi said.

Amos and Katria were floating in the cramped space of their chosen radiation shelter. It was nothing more than a four-meter length of hallway with heavy pressure doors at both ends. Netting hung on both walls with rebreathers, first-aid kits, emergency vac suits. Bobbie had stowed a gear bag with the less-standard equipment.

As soon as she and Naomi climbed in through the one open door, Katria slapped her hand to the panel and it slammed shut.

"What the fuck?" Amos said, rounding on her.

"We need that closed when the bomb goes off," Katria replied, pulling

the detonator out of her pack. “You know, to live.”

“Nothing happens without my direct order,” Bobbie said to her and put a restraining hand on Amos’ chest. He reacted by mag-booting himself to the deck, so she kicked on her own boots and clamped them to the bulkhead to keep her leverage.

“Babs,” Amos said, “I’m going to go get Cap, and it’d be nice if you held off on the boom till I’m done.”

Bobbie waited for Naomi to voice her agreement, then Katria to argue against it, and for their tiny shelter to turn into shouting and chaos. But to her surprise, everyone just looked at her. It was an interesting fact of her brief captaincy that the only time anyone seemed to want her to make a decision was when it was one she didn’t want to make.

Amos was staring at her, his expression as blank as always. But he held his fists with the ease of long use, and Bobbie knew how fast the old man was in a fight. With his feet clamped to the deck for leverage, he’d be tough to restrain if he decided to start swinging.

“Our window is closing,” Bobbie said, raising her hands, making it about the logic of her words instead of a threat. “At some point someone checks that alarm and finds two dead guys. We don’t have time for a rescue.”

“She’s right. So let me blow this fucker and get on with it,” Katria added. Bobbie winced at the cold disregard in her words, but didn’t take her eyes off Amos.

Naomi still hadn’t weighed in, but Amos’ eyes kept cutting to her, waiting for the go sign. If Naomi said, *Yes, go get him*, Bobbie knew the only way they’d keep Amos in the room was to physically restrain him. Bobbie couldn’t see what Naomi was doing behind her back, but whatever it was, Amos wasn’t getting the signal he wanted, because he didn’t make a move.

“Those alarms were moving away from us, fast,” Bobbie said, still only looking at Amos. “Holden knew the schedule. Either he’s made his way to a shelter or he’s told whoever has him now to get to one.”

“You don’t know that,” Naomi finally said.

“No, I don’t. But I hope. And right now, that’s what I’ve got. Because we have to blow that bomb now, or this whole operation fails and we still don’t get Holden back.”

“Yeah, so let’s get on with it,” Katria said.

“Stop fucking helping me, lady,” Bobbie snarled at her without turning around.

Naomi spoke, and her voice was as calm as it was empty. “Bobbie’s right. This can’t all be for nothing.”

Amos flicked his eyes to Naomi, then locked on Bobbie. His face had the same meaningless half grin it always wore, but his shoulders were tense, and his fists were white-knuckled. A flush of blood darkened his neck. Bobbie had never seen him like this before, and she didn’t like it now.

Not that it changed anything.

“Katria, get ready to blow on my signal,” Bobbie said. “Let’s get into these emergency suits for evac immediately after. You’ve got one minute to dress.”

Bobbie heard the Velcro ripping sounds of vac suits being pulled off the walls and hastily donned. Amos wasn’t moving.

“Put your suit on, big man,” Bobbie said.

“You’re really gonna blow it,” Amos replied. He didn’t sound surprised. Or like he was issuing a challenge. He didn’t sound like anything. Bobbie involuntarily braced for violence.

“Yes,” she said.

Without changing his expression, Amos squared up on her, hands at his sides.

“I guess you really want that captain’s chair back, huh Babs?”

Before she knew she was going to do it, Bobbie had already grabbed his collar and yanked him up hard enough to pull his mag boots off the floor, then slammed him against the bulkhead.

“If we had more time,” she hissed at him through her teeth, “you and I would be dancing right now.”

Amos smiled at her. “I got time.”

“Katria. Blow it,” Bobbie said, and the world ended.

When Katria’s charge went off, it demolished the control panel and ripped a seventeen-centimeter hole in the oxygen storage tank. Bobbie didn’t know the exact size of the tank, but she had a vague memory that liquid oxygen compressed down to about eleven hundred kilograms per cubic meter, and

now all of it was trying to become a gas again, all at once.

The initial blast of expanding gas was deafening. The shock wave ripped apart bulkheads and piping. All the liquid oxygen in those pipes joined the explosion as additional expanding gas. From inside the relative safety of their reinforced emergency compartment, it sounded like someone had set off a tactical nuke in the next room.

And then, as was inevitable, something oxidized fast enough to produce a flame, and the initial blast of air became fire.

The entire emergency shelter shuddered, then canted over onto its side. The reinforced and blast-hardened bulkheads didn't break, but the mounts holding the compartment to the deck were sheared off by the force of the blast. It took seconds that lasted for hours.

The inner walls and the pressure doors at each end of the compartment got hot enough to start smoking. Bobbie shared a look with Amos, then let go of him and they both scrambled to get into the emergency vacuum suits.

When the exterior bulkhead blew out, there wasn't another deafening explosion, but rather a sudden drop in the sound level. The roar was replaced by the hiss of rushing air, then a high whine, then nothing. The seals on their shelter stayed intact, so afterward all they could hear was their own panicked breathing.

"Okay, we're getting massive alarms," Clarissa said, her voice the only calm thing in the universe. "The station's going into shutdown. I'm pulling out too. I'll see you back at the place."

"God *damn*," Naomi said.

"Told you," Katria said. "My shit always works."

Bobbie finished pulling on her vac suit, and saw Amos was sealing up his own. They traded a look. "We need to get out of here," she said to him, and he nodded his agreement. Whatever was going to happen between them, it was on hold for now. They'd come back to it, she was certain of that. And it would need to get settled.

If I just killed Holden, this probably ends with one of us dead.

Whatever she'd imagined when she heard the blasts from inside the shelter, the reality was worse.

They opened the door to an entire deck that had been dropped in a blender, then spun up in a centrifuge. Bulkhead panels, control stations, equipment, decking. It had all been torn, twisted, burned, and then thrown out against the outer walls at high speed. A long piece of pipe was

embedded in a wall, still quivering like an arrow shot into a tree. Something that looked like a metal desk had been slammed into a support beam so hard that the metal had actually fused. And in one corner, a single boot had been pinned to the ceiling and then melted into a stalactite of rubber. She hoped there wasn't a foot in it.

They floated silently through the wreckage looking for their exit. It wasn't hard to find.

A hole gaped in the exterior bulkhead of the drum nearly five meters across. The nearly circular rim of it was all bent outward, like the metal wall had been breached by a giant's battering ram. Which, Bobbie supposed, it had. Only instead of concrete and steel, it had been oxygen and fire. Outside, she saw the faint twinkle of light on the ejecta as it raced away from the station and toward the curtain of black at the edge of the ring space.

"Exactly where I said it would be," Katria cackled. "Damn near half a meter from the exact spot I marked as the weak point. I should charge money for this."

"Do you think anyone survived?" Naomi asked.

"We kept everyone we could out of the affected area," Bobbie replied. "Only should have been Laconians down here ..."

"And anyone who didn't get our fucking memo," Amos added.

"Jim would have warned anyone he ran into," Naomi said. "He wouldn't be able to stop himself."

"Yeah, by then it wouldn't matter much," Amos agreed. "No time to track the bomb down before it did its business."

"And fuck any Laconians who were here," Katria said in a tone that sounded like she'd have spit if she weren't wearing a helmet. "I hope they fucking saw it coming."

"Kat," Bobbie said, "please shut up now."

"This is going to work," Naomi said, pointing out the hole toward the docks. "They're going to think that was our target."

The *Gathering Storm* sat a few dozen meters away. The nose of the ship and its port-side flank showed significant hull damage. Debris from the blast had punched holes in the landing clamps and dragged long gouges down its side. A large cluster of objects that looked like a sensor or communication array had nearly been ripped off the side of the ship, floating now at the end of a tether of cables.

It was an eerie ship. The angles of it were like something cut from crystal, and the curves felt like something grown more than built. It was like looking at a venomous snake. She had a hard time pulling her eyes away.

“Too bad we didn’t kill it,” Katria said, ignoring Bobbie’s request.

“Yeah,” Bobbie agreed. “Too bad.”

Amos pulled a magnetic grapple gun out of the gear bag he was carrying and fired a line over to the elevator shaft exterior. They’d need to climb up to a point not far from the maintenance hatch on the outside of the drum she and Clarissa had used earlier. The hard part would be getting a grapple onto the drum, then hanging on while the station tried to hurl them away at a third of a g. After that, it was an easy climb up to their secret entrance back into the station. Up into Medina from the underworld, and mission accomplished.

Unless something else went wrong. The only thing worse than losing Holden would be losing him for no damned reason.

“Laconians are gonna find this hatch,” Amos said. “Shouldn’t plan to use it again after this. No way the crews that come to fix that hole are gonna miss it.”

“Yeah,” Bobbie agreed. “If we thought the sweeps before were bad, they’re about to get a hundred times tighter.”

“Yeah, fuck ’em,” Katria snorted.

“No,” Naomi said. “It’ll be worse than that. We stung their pride before. But today we hurt them. Hurt them bad. And they’re going to try to make it better by hurting us back. Not just us either. Anyone who they think might be like us.”

While Amos hooked his grapple line to the edge of the hole so that they could climb up to the elevator housing, Naomi remained staring at the damaged Laconian ship.

“We killed a lot of people today,” she said. “Some of them just don’t know it yet.”

Chapter Thirty-Four: Drummer

The battle will be here,” Benedito Lafflin said, indicating a space between the curve of the asteroid belt and the orbit of Mars. The place where physics and geometry calculated that the paths of the *Tempest* and those of the fleets of the EMC and the union would cross. There was nothing there now—no port, no city, no outpost of any civilization. Only a hard vacuum wider than worlds, an emptiness of strategic importance. “We’re calling it Point Leuctra.”

“Luke-tra?”

“The Spartans were decisively defeated there by Thebes,” Lafflin said. “I mean, they call their planet Laconia. Psy ops thought it might speak to their sense of their own invincibility.”

They stared at each other a moment. *That’s the best we’ve got? Intimidate them with classical allusions?* floated at the back of her throat. Lafflin shrugged uncomfortably.

“All right,” Drummer said. Because what else was there to be said? It wasn’t as though her will was going to change any of the factors involved. The timetable was listed at the side of the display, days and hours as ticks of red and gold.

“The eggheads have a good model of the *Tempest*,” Lafflin went on, swapping out the map of the system for a schematic of the *Tempest*. The weird, organic shape of it made her feel like she was looking at a detail from an autopsy. *Here is the vertebra where things went wrong. You can see the malformation.* She smiled at the absurdity of the thought. Lafflin smiled back reflexively. “The only hard data we have is where the PDCs and torpedoes came out, but we also got a lot of good heat data from the last engagement.”

“The death of Independence,” Drummer said. The death of the first void city and everyone who hadn’t fled their home.

Lafflin looked down. “That, yes, ma’am. The data’s given us some idea

about the internal structures too. Enough that we feel confident that we can target the right places on that bastard. Take it out before it reaches Earth.”

Because that was the point, Drummer thought. That was always the point. Protect Earth and Mars. Keep the inner planets safe and independent, even at the cost of more Belters’ lives. And she’d known that. From the moment Avasarala had stepped into her meeting, she’d known. Some part of her expected to feel some kind of outrage, some betrayal. Resentment that the wheel of history was still rolling over the backs of her people first.

She didn’t. There was a term she remembered from her years in the OPA. *Saahas-maut*. She didn’t know where the term came from, but it meant something like *the pleasure you take in hardship*. It was supposed to be a peculiarly Belter emotion, something that the inners didn’t name because they didn’t feel it. She looked at the *Tempest* now, the guesswork lines of her superstructure and drive, the target points along her hull. Drummer wasn’t angry at the inners for using the union to protect Earth. She wasn’t even angry at the Laconians for being another iteration of everything the inners had been before the union existed. War and loss, the prospect of the oppressor’s boot. There was a nostalgia to it. A bone-deep memory of what it had been to be young.

She couldn’t help wondering what that girl, riding rock hoppers and taking gigs at Ceres and Iapetus and Tycho, would have thought of the woman she’d become. The leader of her own oppressions. Not much, probably.

Lafflin cleared his throat.

“Sorry,” Drummer said. “Didn’t sleep well. Vaughn? Could you get me some tea?”

“Yes, ma’am,” Vaughn said. “Also, Pallas.”

“Thank you,” she said. She didn’t mean it.

She’d placed the strategic update with Lafflin on her schedule on purpose. The *Tempest*’s inexorable flight sunward was slated to reach its point nearest to Pallas Station within the hour. The evacuation was complete, or as near to complete as it would be. There was always some old rock hopper with a gun and an attitude who’d stay behind out of spite and rage. It wouldn’t help. One of humanity’s oldest homes in the Belt would be dead before she went to sleep again, or if it wasn’t, it would be because Admiral Trejo had seen fit to grant his mercy. She was pretty sure that wasn’t going to happen. At least she could go into the terrible, predictable

tragedy with all the vulnerable points of the *Tempest* firmly in mind. She had some hope of retribution.

There was a certain peace in the impossibility of subterfuge. Sure, there were stealth ships and long-range torpedoes. The cloak and dagger of vanishing into the vastness between worlds. They worked for a ship here and there. For the small and swift and furtive. But on this scale—the scale of war on the battlefield of the abyss—everyone knew more or less where everyone else was. Their drive plumes and heat signatures announced them. The hard laws of orbital mechanics and time placed every base, every planet, every person predictably in front of their own personal firing squads. Situations like this one, they could see death coming, and it didn't matter. Death still came.

“Did you ...” Lafflin said. “We can continue this after. If you'd like.”

Drummer didn't like. She didn't want to see it happen. Didn't want to hope that Pallas might survive. But she was the president of the union, and bearing witness was part of what she was supposed to do. She wondered where Avasarala was, and whether the old lady was going to watch too.

“Yes,” Drummer said. “That'll be fine.”

Lafflin nodded, rose from the table, and made his way out of the meeting room. Drummer stood, stretched, and switched the display to the tactical service's analytics. The image wasn't real. It was a composite of visual telescropy and Pallas' internal data cobbled together into a best guess that was five minutes old from light delay before it reached her. Without Tycho beside it, Pallas looked ... Calm? Still. The curves of the bases' structures didn't spin against the starscape. Pallas was older than that. By the time they'd learned how to spin asteroid stations up, Pallas had been in business for more than a generation. It would die without changing. A countdown timer showed the minutes to the *Tempest*'s closest pass. Seven minutes and thirty-three seconds.

The door slid open again, and Vaughn ghosted into the room, a drinking bulb in either hand. The smell of tea wafted to her seconds later. He didn't speak as he reached out to her. The bulb warmed her palm and the tea was rich and sweet.

“Hard day,” Vaughn said. It was strange. She didn't like Vaughn or dislike him, but she'd come to rely on him. And now, in this traumatic hour, it was this crag-faced political operative at her side instead of Saba. The universe was tricky, and its sense of humor came with teeth.

“Hard day,” Drummer agreed.

On the display, the *Tempest* fell slowly toward the sun. Pallas Station would pass on the ship’s starboard, and too far away to see with the naked eye. Admiral Trejo would be watching the show on a screen of his own. The death of Pallas would be one of the most observed events in history. Five minutes and fifteen seconds. Which meant, in Pallas’ frame of reference, now.

She took another sip of tea, feeling the hot water against her tongue and the roof of her mouth, Brownian motion making it seem to fizz against the soft flesh of her palate, beat against the individual taste buds. Molecules of sugar latched to contact sites, and the nerves ran through the meat of her tongue, back into her body like she was drinking twice, once with the liquid and once with electrical fire. A sense of vertigo washed through her.

She tried to put the bulb down, but the surface of the table was distant, visible, but through a distracting cloud that was the air—atoms and molecules bouncing against each other, striking and spinning away and striking again. Thicker than bodies at a tube station.

She tried to call out to Vaughn. She could see him, right there before her, the jagged territory of his skin fractally similar at every scale. She tried to make out his expression, but she couldn’t bring her focus back that far. It was like trying to see the face of God. Something hummed and throbbed, ticking faster than she could quite be aware of. The pulse of her own brain, the tempo of her consciousness. It sang like a chorus, and she heard herself hearing it.

She dropped the bulb. It clattered against the table, rolled, and dropped to the ground, falling closed so that it kept even a drop of tea from escaping. Vaughn took a step, then sank down to his knees. His eyes were wide, and his face pale as death and covered by sweat. Drummer sat slowly. Her knees felt weak.

“God,” Vaughn said. “Besse God.”

Drummer couldn’t tell if it was profanity or prayer.

The timer on the display read two minutes and twenty seconds. Whatever had happened, it had taken almost three minutes out of her life. It hadn’t seemed that long. Maybe she’d passed out?

“I need,” she began, and her voice felt strange. Like she could still hear overtones fluting up from her vocal cords. “I need to know what that was.”

“I don’t,” Vaughn said. He was weeping. Wide, thick tears dripping

down his cheeks.

“Vaughn,” she snapped, and it sounded more like her own voice again. “Come to! I need to know what that was.”

“I saw everything,” he said.

“How widespread. What happened. Everything. Get me reports.”

“Yes,” he said, and then a moment later, “Yes, ma’am.” But he rested his head on his knees and didn’t move.

On the display, the timer came to twelve seconds, and the *Tempest* fired. Not missiles, but the magnetic beam that Saba had reported. The thing that had stripped the defenses from the slow zone and burst gamma radiation out all the gates. Pallas Station vanished like a blown-out candle with eleven seconds to spare. They were roughly five light-minutes away, so it had happened ... the two things had happened together in the *Tempest*’s frame of reference.

“Tur,” she said. “Get me Cameron Tur.”

“The thing you have to understand is that the technology of the ring stations doesn’t break the speed of light,” Tur said, his Adam’s apple bobbing like a ball on a string. “The one thing we can absolutely say is that the protomolecule is bound by the speed of light. Everything they designed got around it with a different understanding of locality. That’s not the same thing at all.”

He was talking fast and, Drummer thought, more than half to himself. That she was in the room let him think out loud, but he didn’t have his science-advisor voice tuned up. This was one step short of a chimpanzee shrieking and pointing at the charred spot where lightning had struck.

“If you look at it, the gates themselves are clearly bounded by lightspeed. The strategy the protomolecule employs is to send out bridge builders at subluminal speeds to environments where there are stable replicators to hijack and employ to ... to poke holes into a different space. Going from Sol gate to Laconia or Ilus or wherever, we don’t accelerate ships past lightspeed, we just take a shortcut because the slow zone is a place outside locality where very different places in *our* reference can be very nearby in *that* frame.”

“That’s great,” Drummer said. “Was it a weapon?”

Tur goggled at her. “Was what a weapon?”

“That—” She waved her fingers in front of his eyes. “That whatever the hell that was. With the hallucinations and the missing time. Was it a weapon? Can the Laconians turn us off like that anytime they want?”

“It was ... it was associated with their weapon,” Tur said. “I mean it happened at the same time, but that’s the thing. Time doesn’t actually work like that. ‘The same time’ is a weird linguistic fantasy. It doesn’t exist. Simultaneity doesn’t act like this.”

He waved his arms, flapping them out toward the sides of the room. *This.*

The whatever-the-hell-it-had-been hadn’t just happened in Drummer’s meeting room, or on People’s Home. It had been spread throughout the system—Earth and Mars, Saturn’s moons and Jupiter’s. Even the science stations on moons around Neptune and Uranus, and the deep labs in the Kuiper Belt. The reports were startlingly similar—hallucinations and lost time that began uniformly at the moment the *Tempest* had fired its magnetic weapon at Pallas Station. Or, more accurately, the moment in the *Tempest*’s frame of reference. Tur seemed very specific about that. Like it was important.

“But it didn’t happen when they fired it in the slow zone,” Drummer said. “Why didn’t Medina have this happen?”

“What? Oh, no, we don’t know. The ring space and the station there and the gates, we don’t know what their relationship is with normal space. The rules of physics may be different. I mean, it’s clearly an active system, and the energy output from the magnetic weapon there was smaller than the gamma bursts that came from it, so it was tapping into an energy supply that didn’t have anything to do with the *Tempest* per se. But the thing is I’m not sure that was a propagating event. If it wasn’t a propagating event, then maybe it didn’t violate lightspeed.”

“I don’t know what that means,” Drummer said between clenched teeth.

“Well, I mean when you drop a pebble in a pond, there are ripples. They propagate, and all propagation is limited by lightspeed. But instead of a pebble, imagine you dropped a sheet of plating. So that the surface of the plating hit the surface of the pond everywhere at once. It doesn’t matter that the trigger that dropped the plate was in one place, because it happened everywhere. Not a point location, but a nonlocalized location.”

“Nonlocalized. Location,” Drummer said, pressing her palms into her eye sockets. Annoyance and fear curled in her throat. *So you’re telling me you don’t know shit* floated at the back of her mouth.

“Everyone would experience it as if the effect began exactly with them and then propagated away in every direction at the speed of light, but in reality—”

“I don’t care,” she said. It was still harsh, but less than what she wanted to do. Tur reared back from her anyway. “What it is, what it means about the way you understand the universe or physics? I don’t care. None of that matters to me.”

“But—”

“They just demonstrated a weapon that at its minimum ripped Pallas Station down to hyperaccelerated dust. I am preparing to lead thousands of soldiers on hundreds of ships into battle against this thing. You need to tell me was that a glitch in consciousness because of their attack, or can they make that happen again anytime they want? Did they know it was going to happen? Did they suffer all the same high weirdness that we did? Because if they can turn our brains off for a few minutes at will, I’m going to need some *very different strategies*.”

By the end, she was shouting. She hadn’t meant to shout. Tur had his hands up, palms toward her, like he was afraid she might attack. Fine, let him wonder. Maybe it would focus him up.

“I ... that is ...” Tur took a deep breath, let it out slowly. “I feel comfortable saying that the glitch, if that’s what we’re calling it, was associated with *Tempest*’s attack on Pallas. Given that it didn’t happen in the slow zone, I can’t say whether it was a controlled effect or an artifact of the weapon with some quality of local space around Sol.”

“All right,” Drummer said.

“Whether the enemy anticipated it or not, I can’t say.”

“That’s fair,” Drummer said. The first pricks of regret were forming at the back of her mind. She shouldn’t have yelled at him.

“And I can’t say whether they suffered the same effect ... but I would guess they did. If I’m right about the mechanism, there isn’t any sort of shielding against it. You can’t block something that’s already there. That’s what *nonpropagating* means. It doesn’t come from anyplace. Everywhere it is, that’s where it came from.”

Drummer leaned back. That, at least, was interesting. If the Laconians

had to go through the same things she had every time they fired their big gun, it would make a gap when automated systems might be able to penetrate their defenses.

“We’re also seeing the increased quantum creations and annihilations much more broadly,” Tur was saying somewhere nearby. “Like *system-wide* broadly. And there’s early suggestion that some experiments on Neptune and Luna that were working with controlled entanglement structures collapsed. So maybe—”

Drummer leaned back in her chair, folding her hands together. Her eyelids fell to half-mast. She knew—they all knew—that this was the first time one of the Laconian ships had left its home system. This wasn’t only an invasion, it was also a shakedown cruise. And nothing ever went completely as expected on a shakedown. The question was whether the Laconians knew what had happened. Whether they’d been anticipating it. If they’d been taken by surprise as well, they might not risk using the magnetic beam again.

Tur wouldn’t be able to tell her that. Or Vaughn or Lafflin. Admiral Trejo could say it, but not to her. Which meant there was only one plausible way for her to find out.

Her heart leaped at the idea, and she waited for the joy to fade before she risked thinking about it again. It was always dangerous when the universe fell down in a pattern where the thing you wanted and the wise path were the same.

Somewhere, Tur was still talking. He might as well have been on another ship. Drummer’s mind pressed through the possibilities, the dangers, the possible profits, and the certain loss. Each time, she found herself at the same conclusion.

She thanked Tur, using the social conventions of conversation to signal him it was time for him to go. She even shook his hand to make up a little for losing her temper before. As she walked him to the door, he was still talking about locality and signal loss. She closed the door behind him and went back to her desk.

Vaughn answered the connection request like his finger had been hovering over the button.

“Ma’am?”

“The *Tempest* is going to make a report. It may go back to Medina, or route through Medina back to Laconia,” she said. “We’re going to find out

what it says.”

“Yes, ma’am. And how are we going to do that?”

“Saba,” she said. “The risk is worth it now. We’re reopening communications with Medina.”

OceanofPDF.com

Chapter Thirty-Five: Singh

An improvised explosive device punctured a liquid-oxygen storage tank on deck four of the engineering section,” Overstreet said. He was reading from a report that scrolled by on the monitor wrapped around his thick forearm. “We’ve recovered very little of the device itself, but what few pieces we have indicate it was made with material common to this facility. It’ll be difficult if not impossible to track the exact source.”

Singh sat and listened to the report and tried to look present and thoughtful. But the truth was, his mind was bouncing around like a tiny animal trying to escape a predator. He found he only processed about half of what Overstreet was saying. His hands were shaking so badly that he didn’t trust himself to pick up the glass of water on the desk in front of him. He kept them under the desk, where Overstreet wouldn’t see them. The sense that he was in immediate danger was inescapable because it was true.

“The damage to that deck was significant. Total loss of the primary liox storage. The thrust from the breach caused the station’s maneuvering thrusters to fire, and the shaking knocked down several structures in the habitat cylinder. The network-traffic station for the *Storm* was completely destroyed. A backup environmental-systems plant was significantly damaged, and will probably not be repairable.”

“The *Storm*,” Singh said. *My first command. The symbol of Laconian power at Medina.*

“This is preliminary, of course,” Overstreet replied, flicking one finger to skip down the report on his arm. “It does seem like that might have been the target of this attack, so minor hull damage and the loss of one sensor array feels like we got off light.”

Singh’s hands felt like they were shaking hard enough to be visible, even under the desk, so he gripped his thighs with both hands and held on tight.

“Preliminary casualty reports?”

“Again, light,” Overstreet said. “At this time, we have five confirmed

Laconian fatalities, three from the engineering detail, two from security. Seven injuries ranging from life threatening to minor. Only two locals confirmed dead at this time. But we also have another dozen missing, so that number will probably go up.”

“To be willing to do so much damage to their own station, to their own people, just to try to hurt us ...” Singh said, then trailed off.

“We have several persons of interest in custody,” Overstreet said. “One of them was setting off alarms immediately before the blast. It’s possible he wasn’t involved, but the coincidence seems unlikely. I will be debriefing him once we’re done here.”

“Is he a local?”

“Former captain of a Transport Union ship. James Holden.”

Singh frowned. “Why do I know that name?”

“Apparently he’s something of a celebrity, sir. He was involved in the Io Campaign and the defeat of the Free Navy back in the day.”

Both things that had happened when Singh was a child. The old guard still playing old-guard games.

“We will need to make the strongest possible response to this,” Singh said.

Overstreet nodded, his face grim. The hesitation meant something that Singh didn’t understand. “Sir, the radical factions of the Outer Planets Alliance fought a guerrilla war with Earth and Mars for nearly two centuries. The veterans of that war are almost certainly in leadership positions in this insurgency. That means we have some difficult decisions to make. About the scope of response.”

“I’m sorry,” Singh said. “I’m not following ...”

“Insurgencies are historically nearly impossible to eradicate, for a few very simple reasons. The insurgents don’t wear uniforms. They look just like the innocent populace. And, they’re the friends and family of that populace. This means that every insurgent killed tends to increase recruiting for the insurgency. So unless you are willing to rack up a sizable civilian casualty count, we can’t just shoot everyone we suspect. If we take the strongest *possible* response, we stop calling it counterinsurgency and start calling it genocide.”

“I see,” Singh said. He’d studied counterinsurgency and urban pacification at the academy, of course. Afghanistan had been impossible to conquer going all the way back to Alexander the Great. Ireland in the

twentieth century. The Belter troubles for the last two centuries. It was different reading about it, but now he saw how this cycle of violence could go on and on for him too. "I'm not prepared to execute every Belter on the station."

Overstreet seemed to relax without visibly moving at all.

"I agree, sir. All we can do is make it harder for them to operate," Overstreet said. "We're going to have Marines enter every compartment on the station. Anything we don't control or have immediate use of will be sealed and the atmosphere removed. It won't end this, but it'll make it harder for them to plan and execute with no spaces under their control."

"Agreed," Singh said. "You have authorization to conduct this operation, and shut down any sections of the station you see fit. Let's see if these people can work in daylight, not hiding in the sewers."

Overstreet stood and saluted, then headed for the door. But just before he left, he turned back as if suddenly remembering something. "Sir, you might consider putting more pressure on your civilian informants. This is exactly the sort of thing they should be doing for us."

"Yes," Singh agreed. "That's next on my list."

The Belter with the badly broken nose—Jordao, Singh thought he called himself—was ushered into the office by two Marines. They held him by the arms, his feet barely touching the ground. His expression was somewhere between angry and sniveling.

"Put him down," Singh told the Marines. When Jordao moved toward a chair, he said, "Don't sit."

"Sabe, bossmang."

"You know about the attack?" Singh's hands had mostly stopped shaking after Overstreet left, so he took a sip of his water. It was all playacting. Look calm, casual, in control. Make Jordao feel like Singh already knew the answer to every question he was asked. Make him afraid to lie. It seemed to be working. Jordao rubbed his hands together and bobbed his head like a suppliant.

"Sa—I mean, yes, boss, I heard."

"It shook the station hard enough to knock down buildings in the drum

section,” Singh said. “So, of course, everyone knows about it. I’m not asking that. I’m asking if you *know* about it.”

“Knew the underground was up to something, them, but details? I don’t —”

“Because, you see,” Singh continued, “I released your sister from our lockup as a down payment for future services rendered. Services like letting me know when a bomb was going to blow up half the engineering section of my station, for example.”

All the servility left Jordao’s face. Singh watched it happen, like a switch had been flipped in the man’s head. He was a man who would grovel only so far and no farther. It was a useful fact about him, though it did seem to diminish his value.

“Old OPA, them, sa sa que? The ones the inners couldn’t kill,” Jordao said, not attempting to hide his thick Belter accent now. “The ones like me? We never get to know.”

“Before you leave this room, you will give me a list of every name you think might be involved in this underground so we can add them to our surveillance list. You will also make sure that whatever happens next, you are part of it, so that we can catch the conspirators in the act and bring the full force of the law against them.”

Jordao was shaking his head. “Kenna nothing, you—”

“Or,” Singh continued. “I will have your sister rearrested, tried for larceny and crimes against the empire, and hanged in a public space as a warning to others.”

Before Jordao could respond, Singh nodded at his Marines, and they picked the Belter up off the floor again. “He doesn’t leave until his list is delivered and verified.”

“Copy that, sir,” one Marine said, and saluted with the hand that wasn’t holding Jordao.

The Belter looked from him to the Marine and back again, understanding blooming in his eyes. Understanding and fear.

When it was over and he was alone in his office, Santiago Singh found that he very much wanted to send a message to his wife. Tell her how afraid he

was. Tell her that maybe accepting this assignment had been a terrible mistake. That walking the line between the man he had always thought he was and the ruthless authoritarian ruler the job required of him wasn't something he could do and remain whole. That the man who could order civilian deaths as a reprisal could not share the same space with the man who loved his wife and played with his daughter and couldn't wait for her to get old enough so he could buy her a kitten.

But he couldn't make that call, because the explosion had cut the *Storm* off from the station, until they could replace the network encryption node. Which was probably a good thing, because he suspected that everything he would have told his wife was a lie.

The truth—the one that he didn't think he'd ever be able to admit to her—was that he could be both men at once. He'd already delivered the ultimatum to Carrie Fisk that any colony world that joined the resistance would be destroyed. He understood that, should it become necessary, he could order Overstreet to execute every person on the station that hadn't come through the gates on the *Tempest* and the *Storm*. The Marine commander would do it. And that when Natalia and the monster arrived, he would be able to hold them and kiss them and be the man he'd always been around them. And know that he'd made them safe.

That was what terrified him. Not that the job would force him to be both of those men but that he was capable of being both. That all it would take is a bit more pressure, and Santiago Singh would be a man who loved his daughter with all his heart and who also ordered genocides.

He tapped at his desk. "Chief."

"Sir," came the immediate reply.

"How long until we have the network back up so I can send traffic back through the *Storm*?"

"It's on the priority list. I've been told eleven hours until the replacement system is in place."

"Thank you," Singh said. "Please let me know the instant it's done. I have priority traffic for Laconia."

"Yes, sir. Sir? On that topic, the *Storm* reports traffic incoming from the Sol gate, marked highest priority. They have a courier bringing it over now."

"Very well. Bring them directly in," Singh said, then killed the connection.

It seemed too early for the *Tempest* to be reporting the Sol system's surrender, but he was open for a pleasant surprise. According to his tactical map, they would barely be crossing the asteroid belt now. Their projections placed the earliest expected surrender point at the Mars crossing.

Singh needed a distraction to pull himself out of his self-pitying and introspection. Whatever Admiral Trejo needed to tell him so urgently, it was bound to be interesting.

The petty officer who was ushered into his office half an hour later was a tall woman with pale hair that had been turned dark by sweat. She was breathing heavily, and her uniform was damp.

"Sir," she said, then held out a small black wafer to him.

"You look terrible, sailor," Singh replied, taking the chip. "Are you all right?"

"The Marines are using all the carts for patrol duty, so ..."

"Did you actually run this over all the way from the *Storm*?" Because of the attack, traveling from the ship to his office meant donning a vacuum suit, moving through the damaged sections of the station, then removing the suit and running down the long spiraling ramp that went from the center of rotation down to the drum floor. And after that a kilometer-and-a-half run across the drum to reach his office complex.

"Yes, sir," the petty officer said, starting to get her breathing under control.

"I'll be sending my compliments to your senior chief. Outstanding effort, sailor. Take a moment to clean up, and we'll round up a cart to drive you back."

"Thank you, sir," she said, then gave him a sharp salute and left.

Part of the self-pity trap that Singh had realized it would be easy to fall into was the terrible sense of being utterly alone in his job. He needed more interactions with his fellow Laconians. With his ship, and the sailors under his command. He needed these reminders that he wasn't working alone. That hundreds of like-minded and dedicated professionals shared the dream of the empire. Singh made a mental note to spend more time on the *Storm*.

He rolled his monitor out onto the desktop and dropped the small black chip on it. "Transfer all files and wipe," he said, then when the monitor blinked its acknowledgment, snapped the little black chip in two and dropped it in the recycler.

Admiral Trejo's face appeared on his monitor. Singh found he was a

little excited. Trejo was a man with even greater responsibility than his own, and one who handled it with dedication and grace. He was a man who always knew the right thing to do, and did it without hesitation. If Singh wanted to spend more time with the Laconian sailors like himself, he wanted to *be* Admiral Trejo. He told the monitor to play the message.

Trejo's face blurred into motion, and his expression became one of puzzlement, and maybe even fear. "Sonny. Something's happened, and we have no idea what it is or what to do about it. We need some help."

He paused, and something like dread took root in his expression. "It seems we've taken on a passenger of sorts."

Singh watched the message play out in fascination and then horror and then fascination again.

The object—there really wasn't any other word to describe it—was a floating sphere of light and darkness hovering about three feet off the deck in a corridor on the *Heart of the Tempest*. Just looking at a recording of it on the monitor's small screen made his head hurt. Someone passed a length of pipe through it and back again on the recording. The pipe did not seem to interact with the object at all. And in fact Singh had the sense that he saw both the pipe and the object at the same time with equal clarity even when that should be impossible. It made his head hurt even worse.

Mercifully, the person with the pipe stopped doing it, and Trejo began speaking.

"As you can see, the anomaly doesn't seem to exist as a physical object. It doesn't appear to radiate on any wavelength, except for visible-spectrum photons. Not one sensing device we've aimed at it can even tell that it's there, but we can record it and see it just fine. Being in the same room with it, looking at it, it's quite disorienting and causes double vision and severe headaches."

As if in response to this, four sailors set up a curtain around it using poles and blankets. While they worked, Trejo continued. "It's moving with us. With the ship, because we're still under thrust and it hasn't moved a millimeter since it first appeared. I've tried making some minor course adjustments, but it keeps us as its frame of reference. I've included all the data we've collected on this file, but I can tell you that its first appearance almost exactly matches the moment when we destroyed Pallas Station. It also includes a nearly three-minute blackout shared by every single person on this ship."

The sailors had finished setting up their curtain, and left. Trejo pulled his monitor close, so his face filled the screen. He lowered his voice, as though telling Singh a secret.

“If this is some new weapon of the inner planets, we need to understand it and now. Blacking out a crew for three minutes, the *right* three minutes, would create a serious tactical advantage for them. I need you to pass along this information to Laconia through our most secure channels. Get me answers fast, Sonny. I’m about to engage with the combined might of the inner planets’ navies, and this is the first thing that’s made me wonder if I can win.”

Singh sank back in his chair, and rubbed his face with both hands. What if everything, including the attacks on Medina, had just been a distraction? What if the inner planets needed time to bring some new superweapon to bear, and feints and jabs from the Sol fleet and his own insurgents were just to create confusion and buy time?

“Major Overstreet?” Singh said to his monitor.

“Yes, sir.”

“I’ll need a cart with an armed guard. I’m going to the *Storm*.”

“Copy that, sir,”

Singh took another data chip out of his desk, laid it on the monitor, and copied all the files Trejo had sent. He then told his monitor to wipe everything. He placed the chip into a lockable metal briefcase, and waited for his ride to arrive.

While he waited, something tugged at his mind. Some memory, from the academy, maybe. Another mention of a sphere of light and darkness. It had to do with the first wave of colonization, even before the high consul had led his people to Laconia ...

He took a moment to have his monitor search the local network for any mention of such an object with the properties Trejo had described.

The search took less than a second, and what it found was a minor colony world named either Ilus or New Terra. In among the list of names connected to what the article was calling the “Ilus Incident” was one that his monitor underlined. When he tapped it, he understood why.

In the report, Captain James Holden of the *Rocinante* had reported seeing the exact object that was currently residing on Admiral Trejo’s ship. The same James Holden who was now in their security lockup, under suspicion of terrorist acts.

Chapter Thirty-Six: Bobbie

The public prison was full, but not with her people. Laconian guards stood at the corners with weapons drawn, watching the crowd watch the prisoners. Drones buzzed overhead, scanning constantly. On the far side of the steel mesh, men and women sat disconsolately waiting for trial or judgment. Bobbie stuffed her fists deep into the pockets of her plain gray jumpsuit. A man at the back of the lowest cell on the left looked a little bit like Holden, but not so much she could talk herself into thinking it was him. Even if they had him, Holden probably wouldn't be put here. This jail was more than half for show—public stocks for a new generation. Anyone with real value to the security forces would be somewhere else.

Still. She had hoped. It never hurt to hope, except when it did.

“Pinché schwists, alles la,” the man next to her said under his breath. She'd been around Belters long enough to translate it in her head. *Lousy kids, all of them.* The man who'd said it had long brown-gray hair and an expression as sour as old lemons. She only smiled her agreement. This wasn't a place where she wanted to say anything aloud against the Laconians.

It turned out it was just as good she didn't.

“Esá all the fucking underground, yeah?” he said. “Things aren't hard enough, now they're killing our goddamn station?”

Bobbie felt her smile grow tighter, less sincere. The rage in the man's eyes wasn't for the invaders who'd swept in, destroyed their defenses, and taken over. It was for the people fighting against them. It was for her.

“Hard times,” she said, because the drones might be listening.

She walked away, heading north along the drum. The straight line of sun above her, the ruins of the engineering decks far away at her back. Being out in public like this left her feeling exposed. The Laconians were everywhere, the checkpoints twice as thick as they'd been before, and everywhere she looked, faces shaped by fear. The Laconians' fear that their

control over the station hadn't been enough to stop the underground. The locals' fear of Laconian reprisals. Her fear that she'd be found out, or that she'd broken something she wasn't going to be able to mend.

Saba's network had managed to get the warning out pretty well. The death toll in the explosion was low. She'd heard a dozen, and most of them Laconian, but it was hard to know what was true. It was as deep in the culture of the Belt as bones in their bodies that you didn't fuck with the environmental systems. She hadn't thought about the symbolic meaning of her plan, or what it took for Saba and Katria to agree to it. To Bobbie, they'd been getting important intelligence and covering their tracks. To the Belters, they'd been saying that they would be free of Laconian rule, even if the only freedom was death. If not everyone on the station signed on for that, she couldn't blame them.

A swath of green grass lawn on her right had a classroom's worth of children, a teacher talking about insects and soil. A man on a bicycle rode past her, whistling to let people know he was coming, and to clear the path. All the things that had happened before Duarte and Trejo and Singh. She couldn't guess how many of the people she was walking past would have turned her in to the authorities if they'd known. How many would have applauded her. There was no way for her to ask.

That was the trick of living under the thumb of a dictator. It broke every conversation, even the private ones. The invasion had wounded everyone, one way or another. Herself very much included.

Her hand terminal chimed, and she plucked it out of her pocket with a sense of dread. The message was from Alex, and all it said was WHEN YOU HAVE A MINUTE. The underground was still using encrypted back channels. The security forces wouldn't see the message in their logs. But if Bobbie got picked up, or someone looked over her shoulder, the words would be innocuous. Saba's cramped halls and corridors were the only place they could speak freely. Everywhere else on Medina had become the land of subtext.

She found an escalator and let it carry her down into the body of the drum. It wasn't far to the entry to Saba's alternate station, but they all had to be careful to see they weren't followed. Their bubble of freedom was fragile, and once it popped, it wouldn't come back.

Alex was waiting for her when she ducked into the access corridor. The flesh under his eyes looked ashy and his shoulders slumped like he was

under a higher gravity than they were. He smiled, though, and that her friend seemed pleased to see her counted for a lot. For more than it should have, even.

“How’s the weather out there?” he asked as they made their way down toward the makeshift galley.

“Stormy,” she said. “Get the feeling it’ll get worse before it gets better too.”

“That was a given.”

In the galley, half a dozen of Saba’s people sat at the tables, talking. The air smelled like noodles in black sauce, but the food was gone. Bobbie wasn’t hungry anyway. One of Katria’s men, a crook-nosed guy named Jordao, nodded to her, smiling a little too widely. She nodded back with a sense of dread. This was not a time she wanted someone hitting on her.

“Any word?” she asked, her voice low even though security wouldn’t hear her. She wasn’t afraid of being found out here, but the wounds were fresh. Some things didn’t need to travel outside the family.

“On Holden, no,” Alex said.

“Okay,” Bobbie said. It cut her a little every time there was nothing, and she welcomed it. If it came back that she’d killed him, the hurt would be a million times worse. Every little wound was a good thing because it wasn’t the killing blow.

“That stuff Naomi pulled off the encryption machine? It’s working. Saba’s folks are able to dig through a bunch of stuff we intercepted before. Of course, the *Storm*’s not talking to Medina anymore since we blew the channel, so we’re not getting anything new. But it makes it rough for the bad guys that they can’t have their ship talk to the station without radio or tightbeam, so ...”

He trailed off like his words were running out of pressure.

“So we won,” she said. “Go us.”

“Doesn’t feel like it, does it? I keep asking myself what the hell happened.”

“We lost Holden.”

Alex shook his head, tapped four fingertips on the table. “Yeah, and that’s hard, but something happened before that. We’ve faced all kinds of bad before now, and it never split up the family. It was always everyone else, never us. Now Naomi’s off in her room, and Amos is wherever the hell Amos is. You’re going for long walks. We used to be a crew. Now it’s me

and Claire playing cards and worrying about everyone.” She heard the accusation in his voice, and she wanted to push back at him. Only he was right. Something deeper was wrong. Had been wrong.

In the hallway, Saba’s voice. A woman replied. It was all too quiet to make out the words. The people at the other table laughed about something. Bobbie hunched forward, her scowl deep enough to ache.

“Holden’s not just Holden,” she said, knowing it was an evasion but saying it anyway. “He’s the face of the *Rocinante*. He’s been on newsfeeds since before I joined up. He’s the special man. We pulled this thing off, and we lost one person in the operation. That’s a win. If it had been you or me or Claire that got caught, we’d still be celebrating, but it was Holden. Now it feels like we lost our good-luck charm.”

“Feels like that to them, sure,” Alex said, pointing to the others with his thumb. “But we lost him before, and it didn’t break us. Him and Naomi retiring was sad. And then he didn’t go away, and that was weird.”

“Yeah. The whole Captain Draper thing might have worked if he’d actually been out of the picture—”

Alex leaned forward, talking over her.

“But we know better. Whatever’s going on with Amos and you, it didn’t start when Holden left. Or when he came back. It was when that big-ass ship steamed through the gate from Laconia and fucked everything sideways. And now Naomi’s curling up in her bunk while everything’s still on fire.”

“She’s not helping with the decrypt?”

Alex shook his head once, sharply.

“She can’t pull back,” Bobbie said. “She’s the best tech on the station. Saba’s people are fine, but she’s better. She can’t just stop working because ...”

Because her lover’s dead. Or worse. Bobbie felt the hurt and the guilt again.

“We need her,” Alex agreed. “I’ll have a talk with her if you want. Unless you want to be the one who kicks her butt?”

“I really don’t.”

“Good, because I don’t want to be the one who tells Amos to get his shit together. So that one’s on you.”

To Bobbie’s surprise, she smiled. For a moment, she could pretend the cramped little galley was the *Rocinante*. That she and Alex were burning

between the gates and the stars. She put a hand on his arm, grateful that her friend was there. And that however shitty things got, the plan was still to fix them.

Alex's smile was enough to show he understood everything she hadn't spoken. "Right?" he said.

"You're Naomi. I'm Amos. Then if Holden's still alive, we find him, crack him loose, and get the hell out of Dodge before the next big-ass ship comes through that gate."

"See? Now you're talking sense," Alex said. He sighed. "Which is good, because I thought I was going to have to tell you to stop sulking, and I really wasn't looking forward to the part where you punched me in the mouth."

Saba stood at the wider part of the hallway where an access panel had been taken out and never replaced. He held his arms above his head, bracing against the ceiling with the unconscious ease of someone ready for a ship that might move unexpectedly. He lifted his chin as Bobbie came close.

"Hey, I'm looking for Amos," she said.

"Problem?"

"Tell you when I find out," she said. "He's not answering his comms."

Saba's brow furrowed. "Que shansy que he's after Holden?"

"I wouldn't put the odds high that he'd go on an extraction by himself," Bobbie said. Then, a moment later, "I mean not zero, but not high."

"See it stays, if you can," Saba said. "We're carrying plenty enough already, and more rolling down, yeah?"

Something in his voice caught her. "More news?"

Saba hesitated, then shifted his head. *Come this way.* "You looking for yours, me looking for you. You want the good word first, or the worrying?"

"Good," Bobbie said. "I'm looking for good."

"Word from a coyo on the cleaning crew is Holden's alive. Locked down tight, but not dead."

A tightness released in Bobbie's gut. Whatever else happened, she hadn't killed him. And more than that, when she found Amos, she'd have it on her side. She felt a deep gratitude that she'd run into Saba before he'd

found him. She had to let Alex know. And Naomi. And everyone. The relief was profound.

“That’s ... Okay. What’s the worrying?”

“Message from the union. From the spy repeater.”

“Wait,” Bobbie said, following him as he walked toward his cabin. “We’ve got communications lines open? I thought we shut that down.”

“Turned it back on for this,” Saba said. “It ate a missile right after. Drummer thought it was worth burning the channel for.”

“Something big, then?”

“Come see.”

Saba had Drummer’s message up on his cabin’s monitor. The change in her face was shocking. It wasn’t only that the president looked tired and thinner. She looked older, like the last few weeks had been measured in years instead of days. Saba didn’t speak, but started the message from the beginning. Bobbie listened until the end, then played it again, making sure she understood. The loss of Pallas, and the loss of time.

“Well,” she said. “Holy shit.”

“Yeah,” Saba said. “Got my people going through all the information we intercepted. All that’s finished decrypting, anyway. Nothing about lost time or boiling up the vacuum.”

“Even if we found something, it’s not like we can sneak a message back if the repeater’s dead.”

“Not sneak one, no,” Saba agreed. “Can shout, though. If it was the right time. Medina’s not home anymore. Not for us. When we scatter, maybe send something back down to People’s Home. Tell them what we’ve got to tell them. If we get anything.”

“Fair point,” Bobbie agreed. “And that is the plan now, right? Clear a path and evacuate as many as we can before the new ship gets here?”

“Already putting out the word to the underground,” he said. He sounded as tired as she was. “Just the ones we trust. Saying to get ready. Window opens, and get to the ships and go. Everyone someplace different. Harder to kill us if we’re not in one place.”

“Even better if they don’t know who went where,” Bobbie said. “I’d love to find a way to take out Medina’s sensor arrays when we go.”

“Would be sweet,” Saba said, his voice dull.

“You holding up okay?” Bobbie asked.

Saba shrugged toward the image of Drummer still on the screen. “That

woman is my heart, and I lost her. Lost my ship. Lost my place for my people. Got an enemy ship killing my cities and stations, and now it can turn off minds in a whole system at once. Got another one like it braking toward me. Got all those Marines in power armor ready to shoot me and mine through the brainpan, and the loosest mouth on a thousand worlds is in the enemy's jail. So given so, I'm all right."

"Holden won't rat us out. He's given a lot of unvetted press releases over the years, but that's not the same as this."

"They have him, they'll have us. Not talking him down, but these people were Mars before they were this. Ask anyone in the OPA from the old days. Martian interrogation, it's a question of how long until the break. Never if. Better that he'd died."

"We can move," Bobbie said. "Do you have any holes that Holden didn't know about?"

"Few," Saba said, reluctantly. "But fewer now. My people are moving now. Still room for you and yours, but there won't be. Not for long. And ..."

He shook his head.

"And what," Bobbie said. "If there's something more, I need to know."

Saba shrugged and nodded at the screen. "When it comes, if it comes, the one system we can't go to? Sol. Anyplace else, I can try for. Anyplace else, I can go. But no matter where it is, she won't be there. Wasn't so bad when the repeater still was, but with it gone, it feels ..."

A tear tracked down Saba's brown cheek. Bobbie looked away.

It was so easy to forget all the others. Not just Saba, but all of them. The crews of all the ships trapped in the dock beside the *Roci*. The children in Medina's schoolrooms, the medical staff in the clinics. The artists playing music live outside the cafés out of love of doing it. Medina Station had been the nearest thing to a void city before the void cities were built. It was a home for a generation of people, and every one of them was carrying something now that made their days harder. She thought of the prisoners in the public jail, the angry man who'd come to watch them. Who had he lost back on Sol? What was keeping him awake in the nights?

There were so many families, so many crews, parents and children, lovers and friends, whose lives had been changed past recognition since Laconia gate had opened. It wasn't just her and the *Roci* crew. It wasn't just Saba. Everyone was dancing on this same landslide, and no one knew how

to make it end well.

She wanted to say something comforting, but she couldn't bring herself to lie. The best she could think of was to change the subject.

"When we get out," she said. "Not if. When. We're going to need a plan. If every ship just bolts off on its own, we'll lose contact. *They* shouldn't know where we went, but *we* should. At the very least, we should have a record of who went where. This every-man-for-himself-and-God-against-all shit's romantic, but we have to plan for something past just this."

Saba nodded. In the distance, voices and footsteps.

"Not just encrypted but in code," Saba said. "Something where only we know what it means."

"We?"

"Ou y mé," Saba said. "Leaders of the underground, us. First among dissidents."

Bobbie chuckled. "Well, there's a fucking job title."

The footsteps came faster now, and coming closer. Saba looked up like an animal smelling smoke. *Fuck*, Bobbie thought. *Not something else. It's too much already. We can't carry something else.*

The woman who appeared in Saba's doorway was older, white hair pulled back in a tight braid. Her body was long and thin, her head a little too large for her shoulders. The classic build of someone who'd grown up without gravity to hold her down. She even had the split circle of the OPA tattooed on her arm. She should have looked ancient, but the brightness in her eyes belonged on a woman a third her age. She looked from Saba to Bobbie and back with something like triumph in her eyes.

"Maha?" Saba said. "Que?" And then to Bobbie, "Maha one of our best communications techs. Had her hands in the codes since before I was born, yeah?"

"And I know all their secrets," she said in a weirdly accented voice. She held out a dumb terminal that wasn't connected to Medina's system. "The new decryption run turned over some stones. And look you what was squirming under one."

Bobbie was closer. She took the handheld terminal and flipped through the file there. It was titled MEDINA STATION SUPPLEMENTARY SECURITY REVIEW AS REQUESTED BY GOVERNOR SANTIAGO SINGH. The file's creator was listed as Major Lester Overstreet. She checked the file length and whistled.

“Que?” Saba said.

“This is way too long to just be an incident report,” Bobbie said. “It’s ...”

The section headings were Materials, Procedures, Personnel, Protocols, Audit Summary, Recommendations. She recognized the style of paragraph marking from when she’d trained back on Olympus Mons. It looked like an MMC security report, but twice as long. Maybe three times. She shifted through one after another, her head starting to swim a little.

“I think ... Saba, I think this is *everything*,” she said.

Chapter Thirty-Seven: Alex

His back hurt. Of all the thousand things that were jacked up and wrong in his life right now, the one that chose to make him crazy was that. His back hurt, just below his rib cage where it clicked for a couple days after they'd been on the float for a while. Now it clicked and ached a little. Just time and age catching up with him, but it made him crazy. Probably anything that he couldn't fix was going to make him crazy right now.

He walked down the tight hallway, his shoulder brushing the conduits and pipes, and told himself that things were getting better. Not losing Holden. That was still a long way from better. But the rest of it. The rest of them. Whatever else happened, he still had Bobbie.

And for him anyway, Bobbie counted double.

Taking care of their little family had been his job damn near since the day the *Canterbury* died, back in some other lifetime. And usually, he felt like he managed it pretty well. The only time things had really come apart, he'd been married to Giselle and preoccupied with trying to pump air into that leaking sack of a relationship. But all the times he hadn't lost focus, Alex felt like he'd kept the crew of the *Roci* working together, mostly. It wasn't big things. The powerful stuff was always small. A kind word when Clarissa was feeling unappreciated, a little elbow in the ribs when Holden's outrage on someone else's behalf threatened to eclipse the person in question, a cordon around Amos when the big man was in the bad part of his head. Every crew that lasted more than three runs together had someone who kept a weather eye on the balance. For decades now, he'd been that man on the *Roci*.

Only they weren't on the *Roci* now. And that, so far as he could see it, was more than half of the problem. Not the whole problem. But more than half.

"Hoy, hoy, hoy," one of Katria's people said, trotting up behind him. Alex recognized him from the galley. Young guy with a nose that had

gotten bent sometime back and never put straight. “Passé alles gut?”

“Sure,” Alex said. “Everything’s fine.” It wasn’t true, but he wasn’t looking to talk about family business outside the family.

“Bist bien,” the crook-nosed guy said. “Just. We’re alles busted about Holden, yeah? Whatever Voltaire can do, help out, yeah?”

Alex clapped the crook-nose on the shoulder, and looked deeply into his eyes. “Thank you. Seriously. That means a lot.”

The kid was just another someone who wanted to get close to the action. There had been a million like him over the years. Holden had always been the one who soaked up the fame and celebrity, because for the most part he didn’t notice it. He just kept on being himself, and got vaguely surprised when anyone recognized him. The rest of them had to build up their routines and diversions, ways of being polite to the people who wanted to insert themselves into anything that the *Rocinante* did so they could tell their friends and feeds that they knew James Holden. Shaking Crook-nose’s hand and sending him away didn’t cost Alex much, but it didn’t cost him nothing. Part of him wanted to ignore the guy or yell at him. But this was easier in the long run. He had enough experience to know that, and he was pretty good with patience when he needed to be.

After a well-calculated moment, he turned away and resumed walking toward the makeshift bunkroom. And Naomi.

It had been hard when Holden and Naomi pulled the ripcord, but it hadn’t been unexpected. Part of him had been braced for it since his own second divorce. He’d been ready for the blow when those two packed up their things and retired. When Duarte’s forces blew through the gate and changed everything, part of him had thought that getting Holden and Naomi back was going to be the silver lining.

He’d called it wrong, though.

They treated it like Laconia was the only problem because it was the one most likely to get them all killed, but there was more than that. Now that Holden was out of the picture, the only one in a position to fix it was Naomi.

Fix it. That was optimism. The only one who could fix as much of it as was fixable. He hoped she was able to rise to the occasion. He hoped he was too. But no matter how bad it was, things had gone pretty well with Bobbie. He still had Bobbie.

The smuggler’s cabin was dim. Golden light spilled from the toolkit

light they used for illumination when the built-in fixtures were too harsh. The air was warmer here, and it had the vague smell of bodies and old laundry. They hadn't changed out the sheets since they'd gotten here. Some things slipped when you were hiding from authoritarian police squads and trying to topple a conquering army. Linens appeared to be one of those things.

Naomi sat against the back wall, her stool tipped back so that she could rest against the bulkhead. She smiled when he came in and put a finger to her lips. Alex paused, and Naomi nodded toward the bunk to his left. The lump under the blanket was the curve of Clarissa's back. It rose and fell slowly. She was asleep. Alex turned back to Naomi, gestured to the door behind him in invitation, but Naomi shifted her stool to one side, making room for Alex to sit on the lower bunk beside her. *Come sit with me. I will not go outside.*

With a sinking sensation in his gut, Alex sat. His back popped like a bolt shearing off, and the ache went away. In the shadows, Naomi seemed like someone just waking up from sleep or just falling into it. On a borderline, regardless, between one state and another.

"Hey," Alex said softly.

Naomi made a little wave with a smile behind it. "I've been sitting with her for the last couple hours. Amos is trying to get something to take the edge off in the short run, but we need to get her to the med bay. That sludge in her blood is building up. It's making her jittery."

"Soon as we're out of here," Alex said. "First thing. How're you holding together?"

She shrugged with her hands.

"Yeah," he said.

"You coming to tell me that I need to put my big-girl boots on? Stop sulking in my tent and rejoin the battle, quick before Patroclus does something rash?" There was a warmth and a humor in her voice he hadn't expected. It almost undercut the sorrow that he had expected.

"Yeah, I don't actually know who Patroclus is," Alex said.

"Greek kid, got in over his head," Naomi said, waving it away. "I'll be fine, Alex. I'll be out there. Just I needed to be away for a little while. It's just the down cycle."

He went through all of the things he'd planned to say, all the arguments he'd prepared to make. None of them seemed to quite fit the situation.

“Yeah, okay,” he said instead. And then, a moment later, “Down cycle?”

“The part where I don’t know if he’s dead or alive. The part where I don’t know if I’ll ever see him again. The part where I think how much I want him to be here and safe and not hurting. And telling me not to hurt either.”

“I know it’s ... that’s got to be—”

“Alex, I live here,” Naomi said. “I can’t tell you how many times he’s put me here. How many times he’s seen the right thing to do and rushed off to do it without thinking about the price. Without letting me or you or the *Roci* scare him into being less than his conscience demands. He doesn’t even know he’s doing it. It’s natural to him. Who he is. It’s the only thing about him I’m really angry about.” The buzz in her voice wasn’t sorrow.

Alex took a deep breath and let it out slowly. “I may not have really understood the whole situation.”

“You remember Io? When he went off to a ship with active protomolecule all over it because maybe he’d be able to save Mars? Or Ilus, when he vanished with whatever that weird version of Miller was because maybe he’d be able to keep you and me from falling out of orbit? Or on Marais, when he went into the cliffs so we wouldn’t run out of water? So this time he went to keep Amos and Katria playing nice, and instead, he saved the whole operation and maybe opened the way for all of us to get away safely. All it cost was *him*. And he paid that price without hesitating. Same as *fucking* always.”

A tear tracked down her cheek, and he felt his own eyes stinging.

“We’ll get him,” Alex said. “We’ll always get him back.”

“Sure we will. Until the time we don’t,” she said. “It’s like this for everyone. There’s always going to be a last time, eventually. I just wish with Jim there could only be *one* last time, and not all of them, over and over and over.”

He took her hand. Her fingers were warm, but thinner than he remembered them being. He could feel the little bones beneath the skin, and her skin was dry.

“He’s exhausting,” she said.

“But we love him.”

She sighed. “We do.”

They sat in silence for a moment before she drew her hand back from his and wiped her cheeks dry. She leaned forward, setting the legs of her

stool down against the deck. Her sigh came from a thousand clicks away. "Let me get cleaned up, and I'll get to work," she said.

Alex stood when she did, but waited behind as she walked out. He'd been traveling with Naomi for a lot of years. It was amazing how easy it was to forget how much she knew herself. He didn't know if that said more about her or him.

Probably him.

Clarissa made a soft sound, somewhere between a grunt and cough. She turned toward him. Her skin was pale, sheened with sweat, but her smile was strong and unforced. "Hey," she said. "What did I miss? Did we hear about Holden? What's news?"

"No, it wasn't that. I was just getting a little pep talk," Alex said. "How're you doing?"

Clarissa's eyes drifted closed and then open again, like a blinking in slow motion. "Living the dream," she said, and chuckled. "Have you seen Amos? He was going to get me ... something."

"I think he's still out doing that. He'll be back, though. Don't worry."

"I never do," Clarissa said, and shuddered like she was cold. The room wasn't cold. "You think they could fix me?"

"Who?"

"The Laconians," Clarissa said. "I keep thinking about how their tech is all levels and levels above ours. And I wonder if maybe their medicine is too. Maybe they could get these fucking implants out of me. Plaster over the worst of the damage."

"I don't know. Maybe."

"Kind of ironic that I'm working to fuck them all the way up, isn't it?" She made a single, low sound. If she'd strung a few like it together, it would have been chuckling.

"I guess it is," he said. And then a moment later, "If you want to go to one of their clinics? I mean it would probably mean getting out of this underground business, but if you want to, we can work something out."

Her smile was love and pity. "You really think that's true? That we could work something out?"

"Hell yes," Alex said.

"Well, I'll keep that option in mind," she said. "You're a good man, Alex Kamal."

"You're not too bad yourself," he said.

“I am not presently at my best,” Clarissa said. “But I appreciate the thought. I really do.”

Her eyes fluttered closed again. Her face relaxed. She looked like a wax model of herself. *She'll be better when we get the Roci back*, he thought. *Not better-better. Just improved, but better than this.* And once he was back in the pilot's seat, he wasn't ever going dockside again if he could help it. Being on the *Rocinante* was being home.

Everywhere else was where the trouble came.

Bobbie came with the news about Holden, and something else besides. It felt almost like something foreordained. As soon as he had told Naomi that they'd save Holden, Holden appeared in the station brig and the document outlining how to free him fell into their hands. It was perfect enough to make him very nervous.

“This is astounding,” Naomi said, paging through the file.

Alex leaned over her, trying to see the screen of her terminal and not interrupt her at the same time, and doing a middling job of both. If there was any sure sign of Naomi's relief, it was that she was back on the job.

The room was small, the door firmly closed, and Saba had set the monitor to the local newsfeed with the volume high. A young man he didn't recognize was interviewing Carrie Fisk about the war in Sol system and the traffic between the colony worlds that was just about to begin. *The colonies don't care who's running Medina, so long as we're running it well. The Transport Union was fine, and Laconian oversight will be fine too. Better, even, because the Laconian model respects self-rule. The Laconian Congress of Worlds is a real voice for its members. That's never been the case before.* Alex tried watching her, just so he'd have something to do besides hover. It didn't work very well.

Bobbie paced along the wall behind her, three strides one way, then turned, then three back. Saba was more subdued, his body held still and only his eyes flickering. The two of them had the same sense of barely restrained action. Like a boulder on a mountaintop that's just starting to shift toward the slope.

Naomi made a small, satisfied sound at the back of her throat and

followed a linked passage to a schematic of a ship that looked from the outside like the *Gathering Storm*.

“Who knows about this?” Alex asked. “I mean, who’s seen it?”

“One of mine broke the encryption,” Saba said. “She brought it to me straight. Didn’t read it, even. Maha, she solid like stone. Not everyone of mine is, but her? I tell her she didn’t see it, and it never got seen.”

“This has the operational plans for the *Gathering Storm*,” Naomi said. “Whatever else you want to say about these Laconians, they are thorough.”

“Most of it’s MCRN and MMC protocols and practices,” Bobbie said. “Five-sixths of it are the operating procedures Alex and I trained on, word for word.”

“You should both read the thing, then,” Saba said. “Alles la. Mark down where it’s changed. There’s reasons to change things. Might point us the right way. Know what’s behind it, maybe even better than this on its own.”

“I don’t know,” Naomi said. “This on its own is pretty damned good.”

The excitement in Alex’s chest felt like champagne bubbles. Bright and dancing. He’d forgotten what a good break felt like after all the dread. It was astounding to think how close he’d come to scrubbing the mission, leaving the waldoes abandoned in the air duct, and calling it impossible. And if this was the key that let them get themselves and everyone else in the underground off Medina before the *Typhoon* appeared, his balking would have pissed their best chances away.

Holden’s gambit had worked. He’d thrown himself to the wolves so that they’d have this, and it was everything they’d hoped for. Everything but having him back, and maybe that too.

“Is there anything in there about where the prisoners are held?” he asked.

“There is,” Naomi said, her inflection landing on the words in a way that meant it was the first thing she’d looked for. All the rest of it was important, but that part—where Holden was, how to get him out—was a settled issue in her mind. That was enough for Alex. He could hear the details later, so long as there were details to hear.

“Problemas son,” Saba said, shifting his weight. “Maybe is too good, yeah? Maybe is designed to look like something it’s not.”

“You think it’s fake?” Naomi asked.

Saba made a ticking sound with his tongue and teeth. “No. But can’t make the assumption without risking everybody’s ass, yeah? Hoping more

than not. If it is what it is, it won't stay secret for long. Too proud a victory, yeah? Someone finds out, gets a little drunk, then everyone knows."

"You don't trust your people's discipline?" Bobbie asked.

Saba pointed at the closed door. "My people are the crew on the *Malaclypse*. These others weren't mine until they stopped being Drummer's. And she's had five or six layers of bureaucrats between. It's not I don't trust, it's that I don't trust blind. People are people. Fucked up like we all are, it amazes me when we can even make a sandwich."

"A man of infinite cynicism," Naomi said, but Alex could hear the calm behind the words. Whatever she was seeing there, it soothed her more than he'd been able to. And then, "Bobbie, when you were active Martian Marine Corps, did your Goliath suits have a command override?"

"A what?" Bobbie said.

"Command override. Something that let your commanding officer shut the suit down?"

"Sure, we called it a radio. CO said stand down, and we did. What are you seeing?"

Naomi leaned back so that Bobbie—and since he was right there, Alex—could see better. Back when he'd been in the service, there had always been a clear chain of command, and procedures in place for when someone bucked it. Most of the time it involved MPs dragging someone off for a little summary roadside attitude adjustment followed by a court-martial. Maybe it was different in the Marines, but he was pretty sure he hadn't seen anything like what was outlined on the screen.

"They can ... they can turn them off?" Bobbie said, her voice caught between outrage and laughter. "Because that right there looks like it's saying the governor can push a button and turn all those pretty suits of power armor into a couple thousand sarcophagi."

"Life-support functions stay in place," Naomi said. "But disables the weapons and comm systems, and freezes all the joints."

Alex whistled appreciatively. "These folks must really be scared of mutineers."

"Well," Bobbie said. "Think about how they got here. Duarte managed to build a schismatic faction inside the MCRN big enough to start his own navy. Going on with the assumption that no one would ever try the same thing on him would seem stupid. He's not stupid. This solve in particular, though ..."

“Seems a mite overaggressive,” Alex said.

“And it’s always the aggressor who exposes their weakness,” Bobbie said. She put her hand on Naomi’s. “What are the chances we could spoof that lockdown signal?”

“Get me one of their powered suits,” Naomi said, “and I’m pretty sure we could manage it.”

“The *Storm*, Medina’s scopes, and the Marines,” Bobbie said. “This looks like we can build a plan that’s three for three.”

“And the prisoners,” Naomi said. “Freeing the prisoners.”

She meant Holden, Alex knew. Bobbie did too.

“Goes without saying,” Bobbie said.

Chapter Thirty-Eight: Singh

Singh found it unsettling to think of a time before Laconia. He'd been young enough when his parents made the crossing that he had virtually no memories of anything *but* Laconia as home. And yet, Laconia wasn't even the first of the thirteen hundred worlds to be colonized. First, there had been a ball of mud and water that the settlers called Ilus.

The government of Earth, faced with the daunting prospect of surveying, studying, then exploiting the potentially vast riches of these new worlds, did what it always did. It gave out a government contract to a civilian company to do it for them. But when the prospecting vessel from Royal Charter Energy arrived at what the UN was calling New Terra, they found a couple hundred squatters already there digging up mineral resources and calling themselves an independent government.

A lot of violence later, RCE left the planet, Ilus had its own charter from the UN, and it was, up until recently, a founding member of Carrie Fisk's Association of Worlds and an exporter of lithium and heavy metals.

James Holden had been there during the worst of that initial violence. Now he was in an observation room with his ankles shackled to the deck.

Singh considered the man on his monitor. Holden was older than he'd expected, his temples gone white. The images he'd pulled from the public archives going back decades showed that same open, serious-eyed face on a man very nearly Singh's own age.

Now Holden sat with his head bowed forward. Blood streaked the chest and sleeves of his prison uniform. Round drops of it spotted his paper slippers. He cradled one hand against his belly, and his cheek was swollen and bruised. The stool he sat on had a single leg bolted to the deck, and he swayed forward and back like a man nodding himself to sleep. The restraints on his wrists looked like wide black ribbon, but Singh knew they were strong enough that the man's bones would break before they did. He wasn't a person so much as a distillation of human misery.

“Should I ask how many of those wounds came from the explosion?” Singh said.

Overstreet didn’t smile, but a subtle merriness came to his eyes. “If that’s important to you, sir, I’m sure I could find out.”

After the prisoner had set off false alarms throughout the engineering deck, he had been captured. Five minutes after that the real alarms had begun. In other circumstances, Holden would already be dead. All that had kept him alive until now was his connection to the mechanisms and people involved in his terrorist group and his own stubbornness.

But if this was going to work, Singh knew he would have to somehow reach this man. Make a human connection with someone ready to kill Laconians out of prejudice and hatred. If he was going to find something that he could exploit, he had to believe there was good in him, even if he only maintained the illusion for a little while. If he could reframe Holden in his own mind, if he could see some other version of the man than the obvious one, it might be possible. “He did warn people. The alarms before the detonation? They let more people get to safety. When he was taken, he warned the security forces to take shelter. If he hadn’t done what he did, the loss of life would have been worse.”

“That’s true,” Overstreet said. “He could also have chosen not to bomb the air supply.”

What was this man? A patriot to his government? A man so frightened of change he’d resort to violence? A rabble-rouser who took Singh’s governorship as another opportunity to start trouble that he would have been making under any circumstances?

What he came back to—what he brought himself back to—was that point: Holden had let himself be captured in order to save lives. It wasn’t much, but it was all Singh had.

“Well,” he said. “Let’s see what happens.”

Holden looked up as he entered the room. The older man’s left eye was nearly shut and his upper lip was split and scabby. He nodded to Singh as a guard brought a light chair for the governor to sit on.

“Captain Holden,” Singh said. “I’m sorry we couldn’t meet under better

circumstances.”

“Me too,” Holden said. His voice was low and graveled. Singh had the sense that it wasn’t always that way.

“Can I get you anything? A cup of water?”

“Coffee,” Holden said. “I could stand a cup of coffee.”

Singh tapped his wrist monitor, and a moment later the same guard reentered with a bulb. Holden accepted it with both hands and sipped it. His smile seemed genuine.

“This is actually pretty good.”

“I’m glad you approve. I’m more of a tea man myself.”

“It’ll do in a pinch,” Holden said, then lifted his gaze to meet Singh’s. He had surprisingly clear and focused eyes, considering all he’d been through. “Just to clarify, are you trying to build rapport with me, or am I trying to build rapport with you? I’m a little hazy on it.”

“Both, I think,” Singh said. “I haven’t done this before. I’m a novice.”

“Yeah, well. No offense, but you look like a teenager.”

“I’m the same age you were when you were thrown out of Earth’s navy.”

Holden laughed. It was a warm, rueful sound. “I’m not sure you’ll do yourself any favors comparing yourself to me back then. I was kind of an idiot.”

Singh found it was easy to chuckle. He could imagine coming to like this man. That was good. It made the next part easier.

“So why do you hate us? If you don’t mind my asking.”

“You personally? I don’t. But this conquistador bullshit? It’s true I don’t think much of it.”

Singh leaned back in his chair, cocked his head. “This is all a conversation about politics for you, then? It matters to you that much whose vision guides the government, no matter what that vision is?”

“Not that academic,” Holden said. “I’ve spent a lot of years trying to get people to get along without anyone’s boot being on anyone’s neck. Your plan A is what I’ve spent a lifetime pushing against.”

“Do you really think we’re so bad? Look at what we’ve done, how we’ve done it. We haven’t opened fire on a single ship that didn’t attack us first. In all of history, when has a conqueror been able to say that? We have embraced local rule. Any of the colony worlds that submits can make their own local government, keep their own local customs—”

“Unless they conflict with your rules.”

“Of course.”

Holden sipped his coffee. “That’s the thing. The people you’re controlling don’t have a voice in how you control them. As long as everyone’s on the same page, things may be great, but when there’s a question, you win. Right?”

“There has to be a way to come to a final decision.”

“No, there doesn’t. Every time someone starts talking about final anything in politics, that means the atrocities are warming up. Humanity has done amazing things by just muddling through, arguing and complaining and fighting and negotiating. It’s messy and undignified, but it’s when we’re at our best, because everyone gets to have a voice in it. Even if everyone else is trying to shout it down. Whenever there’s just one voice that matters, something terrible comes out of it.”

“And yet, I understand from Ms. Fisk that the Transport Union was condemning whole colonies that didn’t follow its rule.”

“Right?” Holden said. “And so I disobeyed that order and I quit working for them. I was all set to go retire in Sol system. Can *you* do that?”

“Can I do what?”

“If you are given an immoral order, can you resign and walk away? Because everything I’ve seen about how you’re running this place tells me that isn’t an option for you.”

Singh crossed his arms. He had the sense that the interrogation was getting away from him.

“The high consul is a very wise, very thoughtful man,” he said. “I have perfect faith that—”

“No. Stop. ‘Perfect faith’ really tells me everything I need to know,” Holden said. “You think this is a gentle, bloodless conquest, don’t you?”

“It is, to the degree that you allow it to be.”

“I was there for the war Duarte started to cover his tracks. I was there for the starving years afterward. Your empire’s hands look a lot cleaner when you get to dictate where history begins and what parts of it don’t count.”

“So you and your friends decide instead?” Singh said, trying to keep his tone light. “You know that sooner or later, you’re going to tell us who they are.”

Holden took a long drink from the coffee cup and set it down gently on

the floor beside his feet. "I'm hoping for later," he said. "But I see we're already done with the part where we make friendly with each other."

Singh felt the warmth he'd cultivated toward Holden slipping away into frustration. He'd started in too quickly. He should have spent more time building up the relationship, and now they'd both fallen into adversarial stances with each other. It was time to change tack.

"Tell me what you can," Singh said, "about Ilus."

Holden frowned, but not angrily. "What do you want to know?"

Singh waited without answering.

Holden shrugged. "All right. It was the first contested colony. I went out there to try to mediate between the different claimants, and it all pretty much turned to shit. People shooting each other. Old artifacts coming to life and blowing up the ocean. Local ecosystem trying to mine us for fresh water. And there were death slugs. It wasn't great."

"Artifacts coming to life?"

"Yeah," Holden said, shifting on his little stool. "We had a trace of active protomolecule on the ship. We didn't know about it. It was trying to report in about the Sol gate being complete, but everything it wanted to report to was dead or turned off. So it started turning things on. Only part of it was this guy I used to know, and ... It's kind of a weird story. Why do you want to know about Ilus?"

"What about the *other* artifact?"

Holden shook his head, opened his hands. *What other artifact?*

Singh pulled up the image from the *Tempest* on his monitor. A bright-black nothingness. He enlarged it and held it out for Holden to see.

"Yeah, the bullet," Holden said. "It was the thing that turned everything off again. Deactivated the protomolecule."

Singh felt a chill in his heart. The calmness and innocence of the way Holden said the words was deeper than any threat.

"It did what?"

"The guy I used to know? The dead one? He was a detective, and it was using him to look for where to report in. Only he—the reconstructed version of him—noticed that there was this place that killed off protomolecule activity. He said it was like a bullet that someone had fired to kill off the ... the civilization ... that ... Bring that where I can see it better?"

Singh enlarged the image. Holden blinked. The weariness seemed to fall

away from him, the pain of his injuries forgotten. When he spoke, his voice had a firmness and command Singh hadn't heard there before. "That's not Ilus. Where is that?"

"It appeared in Sol system. On one of our ships."

"Oh. *Fuck* that," Holden said. "All right, listen. There's a woman you need to find. Her name's Elvi Okoye. She was a scientist on Ilus. I don't know where she is now, but she spent years researching the artifacts there, including that one. She went through it."

"Went through it to where?"

"Not like a door. Like she carried part of the protomolecule's network into it, and it killed off the sample. Turned it all inert. And she said it turned her sort of off while it did."

"Turned her off. Like she lost consciousness?" Singh said. "Lost *time*?"

"Something like that," Holden said. "I don't know. I didn't go through it. But I did see the thing on the station. I saw what happened to them."

Singh found he was leaning forward. His blood felt like it was fizzing. And what was more, he saw the same feelings echoed in Holden's battered face.

"There was a station on Ilus?" he asked.

"No. The one here. The station that controls the ring space. The first time anyone came through the ring, that same dead guy took me to the station. It was part of how the rings turned on. But I saw things there. Like a record of the old civilization? My friend, the dead guy, was looking through it for something, and because he was using me to do it, I saw it all too. Whatever made this? All of this? They were wiped out a long time before you and me got here. Billions of years, maybe. I saw whole systems going dark. I saw them trying to stop it by burning away entire solar systems. And it didn't work. Whatever they tried to do, it failed, and they were all just wiped away with just their roads and their old machines left for us to stumble across. That thing that showed up on your ship? That's them. The *other* them. That's the thing that killed everything before Earth and Mars were part of the gate network."

"But why would it appear now?"

Holden choked on a laugh. "Well, I don't know. Have you people been doing anything different recently?"

Singh felt a little stab of embarrassment. It was a fair point. For the first time, the *Tempest* had employed the magnetic-field generator in an

uncontrolled environment both here and in Sol system. Maybe this was a side effect. Or something else about the battleships built on the platforms. Or ...

“Look,” Holden said. “You and me? We’re not friends. We aren’t going to be friends. I will oppose you and your empire to my dying breath. But right now, none of that matters. Whatever built the gates and the protomolecule and all these ruins we’re living in? They were wiped out. And the thing that wiped them out just took a shot at you.”

Singh couldn’t sleep that night. He was exhausted, but whenever he closed his eyes, Holden was there, squinting through his injured eyes, pointing with his broken hand. And the enigma of the bullet, the threat and mystery it represented. They defied him to sleep.

In the middle of his sleep shift, he gave up, put on a robe, and ordered a pot of tea delivered from the commissary. When it arrived, he was already searching through the station records for other documentation of Holden’s ravings. He was hoping to find something to suggest that the man was either insane or playing a game to deflect attention from his terrorism. But file after file, report after report, confirmed him. Even when there was no other witness to what he’d seen, there was at least a history to show that his claims had been consistent.
